## Manufacture of Carborundum.

Carborundum, the new abrasive, is now being turned out in greater quantities than ever before, at a factory at Niagara Falls. Carborundum was discovered in 1891 by E. G. Acheson, who for several years had been on the lookout for some method of crystallizing carbon, as he recognized that such a material would prove of great value as an abrasive. In 1890, when he became associated with an electric lighting company in Monongahela City, Pa., he had opportunity of carrying out experiments. In his first experiment he used an iron bowl lined with carbon and filled with a mixture of carbon and clay, in which a carbon rod was introduced. The bowl and carbon rod served as electrodes, by means of which a current sufficient to fuse the mixture was supplied, the object being to cause the carbon to be dissolved in the melted silicate of alumina, and by cooling the same to the point of solidification, cause the contained carbon to crystallize. When the current rent was applied and the mixture heated up, a violent chemical reaction appeared to take place. When cooled down the mass was carefully examined, with the result that a few bright-blue crystals were found. These crystals were carbide of silicon, or, as they are called commercially, carborundum. The latter name is made up from carbon and corundum, as it was supposed before a chemical analysis was made that carborundum was a compound of carbon and alumina.

TANKS USED IN THE MANUFACTURE OF CARBORUNDUM.

FURNACE AT THE CARBORUNDUM FACTORY AT NIAGARA FALLS.

The manufacture of carborundum, as now carried out at Niagara Falls, is as follows: The materials used are coke, sand (which is very rich in silicon), salt and sawdust, the two latter being used to facilitate the operation of the furnace. These are mixed in proper proportions and introduced into the furnaces, which are of brick built up into four walls so as to form a kind of rough brick box, no mortar or cement of any kind being employed. In the center of each end wall of the furnace is a large bronze plate, to which are connected the cables carrying the current. When complete the internal dimensions of a furnace are about 15 feet long, 6 feet wide and 5 feet high. Connecting with the inner surface of each plate are sixty carbon rods, each of which is about 30 inches long and 3 inches in diameter. The rods project through the walls of the furnace and form the terminals. When the furnace has been built up in this way mixture is introduced, about ten tons making the charge. Through the center of the mixture a core formed of small grains of coke is built, and this serves to form a continuous electrical connection between the terminals. When the current is turned on, the core is soon raised to a high temperature. About an hour after the application of the current, carbon monoxide gas is given off freely and when a lighted match is applied, this burns with the well-known lambent, blue flame and envelops the whole furnace. The current is kept on for about twenty-four hours and then the furnace is allowed to cool down, after which it is opened. When this is done it presents an appearance beautiful in the extreme, the core being surrounded by a cylinder of beautiful carborundum crystals varying in color from yellow to violet. The crystals in immediate contact with the core are in one solid mass; as the distance from the core is increased, the size of the crystals rapidly diminishes, until at about fifteen inches all crystallization ceases and an amorphous material is encountered, of a whitish gray color, for a distance of two inches, when suddenly a black mass, composed of the original mixture, now held together in a cemented state by the fusion of the salt, is met with. The crystalline and amorphous material, lying between the core and the outer black mass, is carbide of silicon. About two tons of carborundum are produced in one run. It is at once noticed that the core is changed in appearance; it now has a somewhat metallic luster, all impurities have been driven off and a very pure form of graphite remains. This may be an important by-product of these furnaces. The presence of graphite denotes that the temperature, when the current was on, must have been nearly 7000 degrees, which is the point of graphite formation. The makers of carborundum, however, take pains to keep the temperature of their furnaces under 7000 degrees, care being taken that it does not run too high, as carborundum is at its best when the furnace work is done between 6000 and 7000 degrees.

The product of the carborundum furnaces at Niagara Falls has been a thorough surprise to the

TABLE OF CONTENTS.

ILLUSTRATIONS.—Tanks Used in the Manufacture of Carborundum; Furnace at the Carborundum Factory at Niagara Falls, 1. Gateway of Fine Hammered Work, 6. The Electric Plow—Two-Share Plow; Four-Share Plow; Dynamo Machine; Anchor, Cable Car, 7.

EDITORIAL.—Manufacture of Carborundum, 1-2. Some Recent Rulings; Output of Gold in California and Colorado for '95; Our California Delegation in Congress; The Revival of Mining and Mining Machinery; "Jumping," 2.

MECHANICAL PROGRESS.—A Drill Sharpening Machine; Silver from Silver Bromide; Ornamental Iron Work; Production of Alumina from Clay; Car Wheels on Track Curves, 6.

ELECTRICAL PROGRESS.—The Electric Plow, 7. New York Electrical Exposition; Chronograph for Electric Street Railways, 8.

SCIENTIFIC PROGRESS.—Twentieth Century Telegraph; Utilizing the Earth's Internal Heat for Power; A Gas Light Unit; Magnetic Map of the Earth, 8.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 9-10-11.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 18.

MISCELLANEOUS.—Concentrates, 3. Notes on Gold Mining in California, 4. The Fauvel Process; How to Make a Million; California's Mining Possibilities; How It Is Worked in London; The Ducktown, Tenn., Copper Mines; Rich Ore at Minas Prietas, 5. Confidence Will Win; Superior Metal Bearing for Heavy Work, 6. A Letter from John M. Wright; Dividends Paid, 11. Coast Industrial Notes; Personal; Catalogues Received; Obituary, 14. Notices of Recent Patents, 19.

discoverer and all others interested in the plant. The yield of the furnaces has been most pleasing, and in some of them truly magnificent crystals, three-quarters of an inch across, have been found; the largest ever produced in the furnaces at Monongahela City never exceed one-quarter of an inch.

To prepare the carborundum crystals for commercial use they are ground down in a mill, treated with sulphuric acid to remove impurities, washed, sifted, and stored away to be sold in the form of powder for diamond polishing, lens grinding, etc., or made up into various forms, such as wheels, hones, slips, files, rub stones, knife sharpeners, scythe stones, and other articles.

The current for furnaces at Niagara Falls is supplied from the Niagara Falls Power Company's dynamos, and comes to the factory by an underground cable at a potential of 2200 volts. In the transfer room at the carborundum factory, the potential is reduced to 185 volts. When the current is first turned on, it is regulated to the full voltage. After about two hours the resistance of the furnace has become reduced sufficiently low to take a current of about 3000 amperes at this voltage. When this point is reached the regulation is carried on carefully, so that as the resistance of the furnace decreases, the potential of the current is reduced sufficiently to keep the supply of energy to the furnace at about 746 kilowatts. The dimensions of the core of the furnace are so adjusted that when the current reaches about 7000 amperes, and the regulation can be carried no further, the resistance of the furnace has become constant. This constant state is reached about four hours after starting, and for the remaining twenty hours the furnace is supplied with a current of about 7000 amperes at a potential of 105 volts.

Not long ago an interesting experiment of the grinding qualities of carborundum was made by a large iron firm in this country. A large roll of iron was nearly half an inch out of the true, and under ordinary circumstances it would have been recast, as the labor of grinding it down by means of emery would have been too great. It was thought that it offered an excellent opportunity to put carborundum to a really severe test, so the mineral was used to turn up the roll. The result was satisfactory, for it was found that the work was done in just one-twelfth of the time that would have been ordinarily required.

It is interesting in this connection to note that while the primary value of carborundum is found in its industrial uses, it is none the less worthy to be placed among our jewels, for this beautiful application of electricity has resulted in developing a gem possessing the colors of all gems and the hardness and refractive powers of the diamond.

The carborundum furnaces as they stand at Niagara to-day are the greatest power consumers in the world. At a given signal 1,000-horse power of electrical energy is turned into the granular core already referred to, and there within a space of 9 feet long and 21 inches in diameter, which is the size of the core, it is converted or transformed from electrical to heat energy—a remarkable amount of work to be performed in so limited a space.

Our engravings on the preceding page give a good idea of the tanks and furnace used in the manufacture.

## Some Recent Rulings.

Secretary of the Interior Hoke Smith has issued a circular which, among other things, says:

"Paragraphs 32, 50 and 51 of the United States Mining Laws and Regulations Thereunder," approved December 10th, 1891, are amended to read as follows, viz:

32—This affidavit should be supported by appropriate evidence from the mining recorder's office as to his possessory rights, as follows, viz:

Where he claims to be the locator, or a locator in company with others who have since conveyed their interest in the location to him, a full, true and correct copy of such location notice should be furnished, as the same appears upon the mining records; such copy to be attested by the seal of the recorder, or if he has no seal, then he should make oath to the same being correct as shown by his records. Where the applicant claims as purchaser, a copy of the location record must be filed under seal or upon oath as aforesaid, with an abstract of title, under seal or oath as aforesaid, brought down to date of filing the application, tracing the right of possession by a continuous chain of conveyances from the original locator to the applicant, also certifying that no conveyances affecting the title to the claim in question appear of record other than those set forth in the accompanying abstract. The abstract therein required may be certified to by the proper recorder or by any abstractor or abstract company duly authorized by State or Territorial statute, if abstracts so certified by abstractors or abstract companies are, by statute, receivable as evidence in the courts of such State or Territory, in the same manner and to like extent that abstracts certified by the recorder are now admitted; provided, that proof be furnished that the abstracts so certified by abstractors or abstract companies are receivable as evidence in the courts as aforesaid.

50—The rights granted to locators under Section 2322, Revised Statutes, are restricted to such location on veins, lodes or ledges as may be "Situated on the public domain." In applications for lode claims where the survey conflicts with a prior valid lode claim and the ground in conflict is excluded, the applicant not only has no right to the excluded ground, but he has no right to that portion of any vein or lode the top or apex of which lies within such excluded ground, unless his location was prior to May 10th, 1872. His rights to the lode in its onward course or strike, intersects the exterior boundary of such excluded ground and passes within it. The end line of his survey should not, therefore, be established beyond such intersection.

51—Where, however, the lode claim for which survey is being made was located prior to the conflicting claim and such conflict is to be excluded, in order to exclude all ground not so excluded the end line of the survey may be established within the conflicting lode claims but the line must be so run as not to extend any farther into such conflicting claims than may be necessary to make such end lines parallel to the other end lines and at the same time embraced the ground so held and claimed. The useless practice in such case of extending both the side lines of a survey into a conflicting claim, and establishing an end line wholly within it, beyond a point necessary under the rule just stated, will be discontinued.

A protestant who seeks to defeat an application for a mineral patent will not be heard to set up the rights of third parties for his own benefit.

In the absence of an adverse claim asserted within the period of publication, the department is warranted in the assumption that no such claim exists.

Questions arising on the applicant's defeat of title are solely between the government and the applicant, and cannot be raised by a protestant who sets up a specific abstract but has no adverse claim within the statutory period.

There is no authority for the amendment of a patented entry for the benefit of a transferee.

Where a petition is addressed to the General Land Office asking for a suit to set aside a patent, the matter should be reported to the department with an expression of opinion as to the advisability of ordering a preliminary hearing.

A lode or vein within a placer claim, and known to exist at the date of the placer entry, is, by the terms of the law, excepted from the operation of the placer patent, and a lode patent may be thereafter issued for the excepted lode or vein upon proof of the proper compliance of the law.

The United States should not attack its own patents, duly and regularly issued, without clear and convincing evidence that fraud was used in procuring their issuance.

THE following is from the Denver *Republican:*

People should look out for the reports on the outputs of California and Colorado for the year 1895. It will not be long after the opening of the new year before they are issued, and it is expected by Colorado people that this State will be shown to be in the lead in gold production. California has held the place of honor so long that the public has been led to believe that no other State could surpass it. If Colorado takes the lead it will set the whole world to talking about our gold resources.

In answer the Salt Lake *Tribune* says: "California has many Cripple Creeks. She has a great mother lode which extends nearly half the length of the great State, that is filled with ore chutes, which, up to date, whenever found, have never failed; further, as they go into the deep, they broaden out until they seem more like quarries than like veins. She has, outside the mother lode, innumerable quartz veins, and Colorado will never equal her in production unless new discoveries beyond anything yet found shall be made. We published yesterday a half-sneering article from the Denver *News* repudiating the figures of the comparative products of Utah, Colorado and Montana, but neglected one most important factor. Near Denver are some of the most extensive smelting works in the world. They receive ores from Utah, Nevada, Idaho, Montana, Arizona, New and Old Mexico, and reduce them, and the product of that reduction is, we believe, always credited to Colorado. There is no doubt about Colorado being a magnificent mining State, but when it begins to repudiate the figures of other States, it is well enough to have the truth told, because the truth ought not to hurt any one."

THE holidays being over, the real work of Congress begins. Our California delegation, if united and persistent, can do considerable toward securing the appropriation asked for to improve the Sacramento and Feather rivers. A commission of U. S. engineers, after mature and intelligent consideration of the subject, twice reported officially to Congress recommending an appropriation of $300,000 to begin the work outlined in their plan of reclamation. It is a necessary internal improvement, as needful at least as other improvements for which the Government has applied millions. California has poured millions into the Federal treasury, has long been neglected in the way of appropriations, and can justly claim the receipt of the small amount asked as an integral part of the nation in work immediately necessary in the broadest sense to the nation's prosperity.

IT is evident that the revival of the mining industry means much for the manufacturers of mining machinery. In no department of mechanical industry is the horizon broader. The demand for improved machinery is a growing one, and, if for a time suppressed, is sure to arise again like a hidden stream, with greater force than ever.

FROM several districts come reports of "jumping" and disputes about claims, customary at this time of year, but noticeably more numerous than usual, indicating the increased activity and appreciation. As in questions of title, so in these instances, no miner is ever bothered by adverse claims till his property proves valuable.

## Concentrates.

THE Mono Mining Co. has levied an assessment of ten cents.

THE Thistle mine near La Porte, now employs about 100 men.

UTAH to-day becomes the forty-fifth State of the American Union.

THE trial of the cyanide patent cases in South Africa begins February 15th, '96.

AT the Esperanza mine, Calaveras Co., the 5-ton chlorination plant will be finished May 1st.

THE new plant of the Katie Mining Co., at Basin, Montana, includes a 500-ton concentrator and a smelter.

DE LAMAR, Lincoln Co., in the southeastern part of the State, is now the liveliest mining town in Nevada.

ALL work on the Green Mountain mine in Plumas Co. was suspended last week, the men paid off and discharged.

THE machinery for the electric milling plant to be put up at Kennedy, Nevada, by the New Era company, has arrived there.

THE Alder Creek Gold Mining Co., of Placerville, Idaho, has filed articles of incorporation, fixing its capital stock at $1,000,000.

THE Rand, South Africa, gold output for November was 195,218 ounces, making 2,099,207 ounces for the first eleven months of '95.

THE De Lamar, Idaho, Mining Co. made a profit of $34,690 on its November operations, 3,236 tons of ore yielding $57,495 bullion in the mill.

THE Northwest Mining Association will have a convention of its second vice-presidents, 300 in number, at Spokane, Wash., on February 22d.

BUTTE, Montana, and Boise, Idaho, now propose each organganizing a mining exchange. Colorado has nine mining exchanges and Pueblo talks of the tenth.

THE old buildings of the Colville, Wash., smelter are being taken down, thus removing the last vestige of a smelting plant from which so much was once hoped.

THE net earnings of the Anaconda, Montana, Mining Co. from February 1, 1891, to June 30, 1895, were $10,147,555.01. So certifies the accountant of the company.

SUPERINTENDENT POWER of the Golden Reef Mining Co., Billings, Montana, is running a 1500-foot tunnel this winter, and will build a 500-ton plant next summer.

SIXTEEN DOLLARS per foot is the contract price paid by the Montana Ore Purchasing Co. to R. J. Filce to sink 150 feet on the Maggie mine, at Camp Creek, Montana.

THE mining bills introduced in the House of Representatives by Congressman Johnson last week were introduced in the Senate last Monday by Senator Perkins.

THE Boise, Idaho, assay office estimates the total mineral product of the State for '95 at: gold, $2,700,000; silver, $5,000,000; lead, $3,000,000, an increase over '94 of $906,940.

THE Anaconda mine at Butte, Mont., emulates the Comstock of former years in the amount of timber it swallows, requiring an average supply of 160,000 feet per day.

AT the annual meeting of the Cassel Gold Extraction Co., Lt'd., in Glasgow, on December 11, '95, the chairman reported a profit for the year of £33,146 8s 5d. A dividend of 5% was declared.

THE Winnemucca, Nev., *Silver State* says John Taylor, who recently struck a ledge of antimony in his mine at Bloody canyon, between Unionville and Star, has shipped a carload of ore to New York city.

STATE MINE INSPECTOR JEFFRIES of South Dakota in his annual report to the Governor places the gold output for that State at $3,500,000 for 1894, $5,000,000 for 1895, and estimates a yield of $7,000,000 for 1896.

J. M. DAY of Redlands, Cal., who is half owner of the Golden Chariot mine, near Perris, says that thirty-five feet of drifting on the ledge from the bottom of the shaft justifies the purchase of new machinery.

IN '95 Russia employed in her mines 250,000 men, and produced gold to the value of 43,800,000 rubles; silver, 3,500,000; platinum, 3,800,000; iron, 63,000,000; coal oil, 35,000,000; salt, 9,000,000; coal, 49,000,000.

THE Richmond Con. Mining Co., at its annual meeting reported that during the year 458 ounces of gold and 17,990 ounces of silver were produced, principally by tributors, the proceeds being $27,515. A dividend of 2s per share was declared.

THE San Francisco Stock Exchange has decided to list gold mining stocks, and suspend article 3 of the by-laws for 12 months, which is to the effect that a fee of $500 shall be charged for placing mining stock on the regular list of the board.

ABOUT thirty Comstock miners who are out of work have chartered a box car in which to go to Cripple Creek. The car will be fitted up with bunks and cooking apparatus, cabin fashion. In this way the men expect to make the trip for about $12 each.

THE increase in the amount of prospecting in '95 is illustrated by a Leadville, Col., paper, which shows by a complete printed list that in '95 to December 22 in Lake county 1493 mineral locations were made, more than double the aggregate of '94.

NEVADA'S estimated mineral output for '95 aggregates $6,000,000, an increase of three-quarters of a million over '94. Recent gold discoveries at Buckeye, Pine Nut and Dayton, in the western part of the State, indicate a doubling of last year's yield in '96.

REGARDING the gold output of the Yukon, Alaska, for '95, Capt. Hayes of the steamer Bertha estimates it at $750,000, and says most of the 200 men he brought down from there last October will go back again next spring. They had about $200,000 in gold, which was sent to this city.

THE fact that the Alaska-Treadwell Co. clears $600,000 annually from ore running $3.72 to the ton, is a good practical illustration of what economical business methods, even in far-off Alaska, can do with large quantities of low-grade ore. It is now being handled at a total cost of $1.20 per ton.

OWNERS of unpatented mining claims who put the required amount of work or improvement on the claim in '95 have until the 31st inst. to file the necessary affidavit. This affidavit may not be required, but it is better to make it, as it is ready and legal proof that the work was done on the claim.

THE coinage at the San Francisco U. S. Mint in 1895 was as follows: Double eagles, $22,870,000; eagles, $490,000; half eagles, $560,000; standard dollars, $400,000; half dollars, $554,043; quarter dollars, $441,170; dimes, $112,000; total, $25,427,213; being $2,550,000 greater than the aggregate of '94.

ON the 12th ult., the Consolidated Goldfields of South Africa announced the striking of a reef at a depth of 1,125 feet in the Simmer and Jack mine, with regularity of width and value. All the first row deep levels shafts are now claimed to have struck the reef and established the value of the ground.

FOR the week ending November 28, '95, in the Broken Hill Proprietary, Australia, 5884 tons of ore were treated, yielding 452 tons of lead, containing 135,064 ounces silver; 993 tons treated by amalgamating and leaching plants producing 14,941 ounces silver, also 56,842 ounces silver produced from matte during half a year.

IN '95 Colorado's gold output exceeded in value that of silver. A Denver estimate places the year's yield as follows: Gold, $14,340,495; silver, $14,259,049; lead, $395,114; copper, $877,492; total, $32,772,150. For '94 the output was: Gold, $11,235,506; silver, $14,721,751; lead, $3,268,613; copper, $767,420; total, $29,993,290.

SOMETHING is always lacking. The Salt Lake, Utah, *Tribune* says: "If we had four or five men who possessed the nerve of some Colorado mining men, and some reporters who possessed the gall of the ordinary Denver reporter, neither Cripple Creek nor South Africa would be in it by comparison with our own Mercur district."

THE Supreme Court of this State has decided that a laborer's lien cannot be enforced against the property of a corporation unless the employment be for wages "due weekly or monthly, on such day in each week or month as shall be selected by such corporation." According to that no lien exists as to laborers employed by the day.

THE South African Mining Department has issued a statement of revenue derived from the various gold fields of that republic for the first nine months of '95, showing that the total amount received by the government, after repayment of private owners' dues, was £1,142,252, an increase of £410,996 as compared with the corresponding period of 1894.

THE same statement is made about the Utica mine in this State and the Independence mine in Colorado, viz: that the owners of each mine have refused offers of $6,000,000 for their several properties. In each case, also, the same answer is said to have been given: "Why should we take $6,000,000 for the mine when there is $10,000,000 in sight?"

THE total output of Leadville, Col., last year was about $12,000,000, of which about $2,000,000 is gold. The number of men engaged in mining, hauling and smelting ore as compiled from official returns from superintendents of the various properties shows miners and mine laborers, 2716; smelter hands, 800; haulers, 300. Total, 3816, an increase of 785 over 1894.

WELLS, FARGO & CO.'S statement of the mineral product of Utah for 1895 shows a total export value of $8,312,352. The total includes the following items: 2,164,757 pounds of copper at 7 cents per pound, $151,532; 70,762,249 pounds unrefined lead at $42 per ton, $1,486,427; 8,223,804 ounces fine silver at 65.25 cents per ounce, $5,366,032; 64,418 ounces fine gold at $20 per ounce, $1,308,360.

THE Telluride, Col., *Journal* says that a good, hard-rock miner does not have to lie idle a moment longer than he desires in that camp. The Smuggler, Union and Silver Pick are both putting on men and paying current wages. Saw Pit will be in condition to use more men as the mines open up, and although not a second Cripple Creek, good miners are in demand in San Miguel county.

W. H. BUSH, of Denver, has a big scheme to run a 12,000-foot tunnel from Cripple Creek to a point below the Victor mine. A company has been formed, capitalized at $5,000,000. The tunnel will be ten feet wide, nine feet high, will have a double track tramway, and it is figured will cost $1,000,000. Beneath the highest point over the line the tunnel will be 1589 feet below the surface, and at the end will be 1400 feet below the Victor mine, passing through the richest part of the district.

THE Idaho Mineral Land Commissioners have wound up their season's work. Major Goode and Colonel McLauren have gone to their respective homes in Virginia and Mississippi. A. A. Crane, the other member, will remain in the Cœur d'Alene during the winter. The Commissioners will return to their duties next spring. During the season the Commissioners examined and classified 110,000 acres of land; 90,000 acres had been previously patented to the Northern Pacific.

THE following is the wording of the bill recently introduced by Congressman Shafroth of Colorado: "Be it enacted that the boundaries of all mining claims located after the passage of this act shall be distinctly marked on the ground by substantial square stakes or posts, at least three inches square, set in the earth at intervals of at least 100 feet apart, with the name of the mining claim distinctly written upon that side of the stake or post which faces the claim, and upon the two sides of the corner stakes or posts which face the claim."

THE Northern Mineral Miners' Progressive Union of America, organized at Iron Mountain, Mich., on the 1st of last month, by delegates representing several thousand iron and copper miners of Wisconsin, Michigan and Minnesota. The resolutions adopted indorse the eight-hour system; approve employers' liability as adopted by the American Federation of Labor; demand the election of mine inspectors by the direct vote of the people; ask the governors of the various States to appoint commissioners to examine inspectors as to their competency as master miners; and demand the right to employ their own physicians.

THERE were 112 delinquent mining assessments on companies represented in this city in '95, representing $1,261,216. In '94 the corresponding amount was $1,543,600. Of the 112 assessments for the year, 66 were levied by Nevada mines, 42 by California mines and 4 by Mexican mines. The Nevada mines took $1,068,266 of the total, California mines $171,950 and the Mexican mines $21,000. The assessments in 1895 were the smallest since '84.

THE Fellow Craft Mining Company—directors, J. W. Provard, A. N. Lewis, G. W. Lewis, J. S. Myers of Alameda, and E. H. Cottrell of New York, capital stock, $100,000, all subscribed; the Segregated Consolidated Virginia Mining Company, capital stock, $11,000,000, M. W. Fox, P. J. Savin, R. M. Collins, E. H. Gould and P. H. Andross, directors; the Birney Mining and Development Company, capital stock, $500,000; L. Ayer, J. F Sheehan, S. C. Denson, J. C. Anthony and P. McCarthy, directors, have incorporated in this city.

IN the case of McCowan vs. McKay, 40 Pac. Rep. 602, Montana, it is held that Section 2332 of the revised statutes of the United States, providing that evidence of the possession and working of a mining claim for a period equal to the statute of limitations of the State shall establish a right to a patent, in the absence of any adverse claim, merely authorizes a patent to issue to an applicant who has held for such period, provided no one files an adverse claim in the land office; and does not give one a right to the claim merely because he has worked it for the statutory time without any adverse claim being made.

REGARDING the bill noticed elsewhere as having been introduced in Congress to mark the boundaries of mining claims by stakes at least one hundred feet apart, with the name of the claim marked upon the inner side of each post, Congressman Shafroth, of Colorado, who fathers the measure, says that such an act would make it possible to locate claims without overlapping existing ones, would to a great degree do away with the endless litigation which is now caused by the filing of new claims on blind surfaces, and cheapen the cost to locators who are compelled now to have surveys made in every instance.

THE Silver King, Utah, mine, which has disbursed dividends to the amount of $450,000 and is considered capable of doing it again, is about to file suit enjoining the Alliance, an adjoining mine, from working ground upon which it (the Alliance) has already driven a tunnel, sunk a shaft and run 2,700 feet of drifts. The cause alleged is that the further prosecution of the Alliance work would tap subterranean water courses and flood the Silver King property. It is thought the outcome will be a costly determination of the mutual rights of both parties to the patented ground under the troublesome "laws of apex."

ARIZONA'S mineral output for 1895 is estimated as follows: Gold, $6,200,000; silver, 375,000 ounces; copper, 60,000,000 pounds; lead, 400,000 pounds. A Prescott dispatch says: The gold output for the year was marked by a steady rise of production, and 1896 is expected to double the above figures. The cyanide process is becoming general for secondary treatment of ores. Silver is declining steadily, and nearly all the output is produced in conjunction with gold. With the renewed production of the Old Dominion and New England works at Globe, the application of the sulphuric bleaching process at Clifton, the copper product for next year is expected to reach the hundred million mark.

AT St. Louis, Mo., this week the United States Court of Appeals decided a case that has been in litigation for over eight years, awarding $404,804 to the plaintiffs, M. Billings, J. A. Wood et al. vs. J. C. Wheeler and the Aspen Mining and Smelting Company. The suit was appealed by the defendants from the United States Circuit Court for the District of Colorado. The plaintiffs asked for two-sevenths of the profits of the Emma mine in Colorado, which was worked by Wheeler in 1884, and later was sold by him to the smelting company, in which he was the chief stockholder and president. The mine was productive for a number of years, and is said to be yielding ore yet. The lower court awarded plaintiffs $439,000.

THE Mountain Mines Co. expect to be ready to haul ore from Iron Mountain to Keswick, Shasta Co., next week. The *Free Press* says they now have eight hundred graders at work, but by the time the road is completed the force will be reduced to two hundred, which number will be employed to keep the road open. Numerous slides are occurring daily, and as some of the cuts are over thirty-five feet in depth, considerable trouble from slides is expected with the heavy winter rains. The company is now expending over $50,000 per month, and have already expended $750,000. During the fall months twelve hundred men were employed, and in the month of November one hundred and two carloads of materials and supplies were received over the lines of the Southern Pacific Company.

IN Boise, Idaho, last week, an opinion was filed in the State Supreme Court in the case of W. S. Haskins vs. Curran & Hussey, denying the application for a rehearing. The case is one involving the distinction between a mining bond or escrow agreement and a direct purchase of an interest in such bond or agreement. Haskins, according to the allegations of defendants, purchased their interest in an escrow agreement for $200. He did not pay them, and when he brought suit against them for money advanced, they sought to set up their claim for $2,000 in a cross bill. This was denied them in the District Court in Shoshone county. The Supreme Court reversed it, and a petition was filed for a rehearing. Justice Sullivan says: "The payment of the $5,600 mentioned in the escrow agreement was optional; the payment of the $2,000 mentioned in the appellant's exhibit was not optional, if the averments of the answer are true."

JOHANNESBURG, SOUTH AFRICA, presents a present field of wealth to the makers of gold-mining machinery and plant. Forty-stamp mills, of about 7000 tons crushing power per month, appear to be the general run of crushing machinery erected at the newer gold mines in the Johannesburg district, but many of the older establishments, where the development has proceeded farther, have 100 to 160. Everywhere large expenditure is being incurred in winding and hauling machinery, and plants already erected are being extended all over the Randt. At the new Primrose mine, Johannesburg, machinery equipment is of the first order. The mill engines have been altered to triple expansion, to cope with the increased output, and 160 stamps are in operation. The crushing at this mine amounts to 25,000 tons of gold quartz per month, and its development is gaining on the crushing mill power to the extent of 2000 tons per month. The management are considering the advisability of erecting forty more stamps, which would raise the crushing mill power to 32,000 tons per month.

## Notes on Gold Milling in California.

NUMBER VIII.

By E. B. PRESTON, M. E., Field Assistant State Mining Bureau.*

*Sodium Amalgam.*—As sodium amalgam is frequently added to the quicksilver by millmen, the following method of preparing it is given: Dissolve small, dry chips of clean sodium, freshly cut from a stick, in pure, dry mercury, gently heated in a flask or porcelain dish; add it piece by piece until the mass has attained the consistency of soft putty, which should always be kept dry and well bottled, as it deteriorates rapidly in the air. This preparation is added to the mercury when dressing the plates, and to know when the proper amount has been added, dip a brightened nail into the quicksilver, which will adhere slightly to the edges of the nail if the amount be correct; whereas, if it becomes entirely coated, too much has been used, and more quicksilver must be added; on the other hand, if there be no signs of adhesion, more sodium amalgam must be added.

Nearly all commercial mercury needs cleaning. The handiest way is to digest with dilute nitric acid for twenty-four hours, taking one part of acid to three of water. It retorting foul quicksilver to purify it, the retort should only be half filled and the quicksilver covered with a layer of quicklime or charcoal powder. The heating should then be done very gradually, the retort not being brought to a full red heat.

*Cleaning Up.*—When ready to clean up a mortar, the feed of ore is shut off, and the speed of the stamps reduced until as much of the sand, etc., as possible has been discharged and iron strikes on iron. The battery-water is then shut off, the self-feeder pushed back, the stamps hung up, the splash-board or canvas removed from in front of the screen, and the face of the latter washed off with the hose. The aprons and plates are then scraped, and the aprons, if fixed, covered with planks near the mortar, to protect them while working around the mortar. The keys that hold the screen in place are withdrawn and the screen-frame loosened and slightly raised, permitting the water that is still retained in the mortar to gradually run out; a too sudden raising of the screen-frame from chock-block would cause the water to escape in a body and possibly wash amalgam from the plates. After raising the screen out of the grooves, the chock-block and inside plates are removed and all of them carefully washed over the apron, scraped, and set to one side or removed to the clean-up room for treatment. The sand mixed with ore on and around the dies is taken out by trowels and passed through some other mortar, or retained to place around the dies when returned to the mortar. The dies are broken out of their beds with the help of chisels and crowbars; when the center or end die has been successfully worked loose, the remaining ones are easily taken out, washed, examined for any adhering amalgam (which is scraped off), and placed on the floor, *in the same order* they occupied in the battery, ready to be replaced. The remainder of the material in the mortar is then easily removed, and placed in the clean-up barrel; in small mills it is panned in a water-box provided for the purpose in the clean-up room. In the revolving clean-up barrel, pieces of quartz or old iron, with an additional amount of quicksilver, are added, and the barrel is half filled with water, where it is left revolving for a couple of hours. As all battery sands contain more or less nails and chips of iron and steel, these are removed by a magnet while panning out. The clean-up barrel is discharged through a manhole into a bucket placed over a riffled sluice. The bulk of the quicksilver and amalgam is retained in the bucket, and the overflow passes into the sluice.

After all the sand, etc., has been removed from the battery, the inside is washed out, and any amalgam found adhering to the sides or linings is carefully scraped off with a case-knife and placed with the rest of the amalgam for further cleaning. A bed of dry tailings-sand is then spread over the bottom of the mortar, and the dies *replaced exactly* as they were before. The tappets are then set, plates and screens put in, the feeder replaced, water turned on, and the battery once more started.

The operation of cleaning-up the batteries is performed usually once or twice a month, and in some mills once a week at which time tappets are re-set and any necessary repairs made; also, any shoes that are too thin or broken are knocked from the boss and new ones substituted. As one new shoe in a battery of old ones causes irregular working, it is best to replace all the shoes at the same time, and if any of them are not worn down thin enough to discard, they may be set aside and used to replace a broken one at some future time. The same thing holds good with the dies, for if they are of uneven height they interfere with the regularity of "splash," and the higher die will be pounding iron while the remainder have still a sufficient cushion of quartz.

The amalgam obtained from a clean-up is washed in small batches in the gold-pan, to free it from all sand, fine iron, or sulphurets, and then stirred up with an excess of mercury in a wedgewood mortar, bringing all impurities to the surface; this dross is skimmed off and collected for further cleaning. The superfluous quicksilver is squeezed through a straining cloth or closely woven drilling, or through buckskin, and the resulting balls of amalgam retorted. This squeezing is best done by hand. After first thoroughly wetting the cloth or skin, it is laid loosely over a cup or bowl, and a convenient amount of amalgam poured in the center, enough to make, when squeezed, a ball of twenty to thirty ozs. The ends of the cloth are then gathered tightly together, and commencing near the ends, it is twisted until the amalgam is compressed to a hard ball, the strained quicksilver dropping into a pan of water beneath. It is not good practice to squeeze the balls too dry, as the last quicksilver expressed is heavily saturated with gold.

In large mills the retorting is done in pans placed in an iron cylindrical retort built into a furnace, where the flame passes under and around it. But in the majority of cases in California they use the cup-shaped iron retort. These are made in different sizes, numbered from 1 to 7; No. 1 containing 150 ozs., and No. 7 2,000 ozs. They are made of cast-iron, with flat or half-spherical lids, which are secured to the retort by clamps and wedges or thumb-screws, the flanges being ground together. From a vent-hole in the cover a curved condensing-pipe, securely screwed in, extends several feet. The retort is placed in a ring-standard, or suspended when retorting, and should always have a space of about 6 inches beneath it. In preparing to retort, the inside is well rubbed with chalk and the balls of amalgam broken up and dropped in loosely; not pressed down into a solid cake, as is sometimes the practice, as that retards the operation. The flanges of the retort and lid are then luted together with a thin paste of flour and water or sifted wood ashes and water (the former is preferable), and securely fastened. The extended end of the condensing-pipe is placed in a vessel with water, and as this pipe must be kept cool, fresh water is kept passing over it during the entire operation. The retort should never be filled to its full capacity, to avoid danger of an explosion through the amalgam swelling and closing the vent. At first a light fire should be started at the top, and the heat gradually increased until drops of quicksilver issue from the end of the condensing-pipe. The retort should then be kept at a red heat until no more quicksilver is seen to issue from the pipe, when the temperature should be raised to a bright "cherry heat" for a short time. The retort should be kept covered by the fire during the whole operation. If during the retorting the condensing-pipe should suck water, it should be raised momentarily out of the water to permit of the latter flowing out. A better arrangement, and one that obviates this difficulty, is to attach firmly to the end of the pipe, a rubber or canvas bag in the water, which will distend itself as soon as the mercury commences to flow, and collapse when the distillation ceases. When the operation is completed, which usually occupies about two hours, if the amount be not very large, the quicksilver is removed and the retort taken from the fire and allowed to cool; the lid is removed and the retort turned over a *dry* gold-pan. If the gold adheres to the retort, a few taps with the hammer on the bottom or the help of a long-handled chisel will release it. Well-cleaned and retorted amalgam should show a good yellow color. If black spots be seen it is proof that the cleaning was not thoroughly done, and a pale-whitish color shows that it still contains quicksilver. Care should be observed, when removing the lid of the retort, to avoid inhaling any fumes retained therein. All retorted amalgam should be melted and run into a bar, before shipping, as it saves losses incurred by abrasion where the distance is great to the shipping point. The melting is performed in a black-lead crucible, which, when new, must first be dried and annealed by placing the inverted crucible and lid in the furnace with a slow fire, which is gradually increased until the crucible is red hot. When ready to commence melting, the crucible is placed on a firebrick in the furnace, after introducing the retorted bullion, in not too large pieces, with borax, and covered with the lid, adding, if necessary, more of the bullion as the metal subsides. After all is melted down, the slag is skimmed off carefully from the top of the metal, which should show a bright surface. It is then ready for pouring. Should the surface not appear bright, but show a scum on top, some lumps of borax must be added, the crucible again covered and heated, when the scum will be slagged and skimmed as before, when it is ready to be poured into a mould. Should the second addition of borax fail to produce a bright surface, a very little niter may be added with the borax. Before using the mould it should be warmed and smoked on the inside by holding over the flame of a lamp or over a dish with burning rosin. The metal in the pot should be stirred before pouring; the stirrer, an iron rod, must be heated before introducing it. The bar, when solid, is turned out of the mould, and any adhering slag is hammered off; it can then be dipped into water to thoroughly cool it, dried, and weighed. Two small chips should then be taken—one from an upper corner, the other from the diagonally opposite lower corner—to be assayed.

ASSAYING AND SAMPLING.

Although at present most California mills have their own assayers to test the ore and the tailings, the time was not so very remote when it was not considered requisite to do *any* assaying. The expert millman could tell (?) by horn-spoon test how much his ore would mill to the ton; and if a horn-spoon test of the tailings showed no amalgam, he confidently asserted that all was being saved. It was decidedly a case where "ignorance was bliss." No gold milling can be carried on under-standingly without light being thrown on the different results achieved, and which can only be given by careful sampling and assaying. It is not sufficient to know that a certain loss has been sustained. It should be accompanied by a knowledge in what particular part of the operation the loss has been incurred, to enable the operator to remedy the evil; hence, the necessity of constant sampling and assaying. In some cases the loss will be found entirely in the coarse sands, indicating that the screens are not fine enough; again, the loss may be entirely through sliming of the ore, or the missing percentages of gold will be found mostly in the sulphurets. The assay test alone, *with correct sampling*, furnishes the knowledge.

*Sampling.*—Samples should be taken regularly of the ore as it comes to the mill, as well as of the tailings *as they pass off*, for without the knowledge derived from these two operations there is no means of controlling the work.

Ore, as it arrives at the mill, is sampled by taking a stated amount (shovelful) from each ore-car or wagon, and throwing the samples together in a pile on a clean-swept floor or into a small bin. The pile should be shoveled over after breaking the pieces to the size of macadam; or if the pile be too large, cut through it at right angles, throwing the rock from the trench thus made in a pile by itself. This should be crushed or broken to a nearly uniform size, mixed by shoveling, and made into a low, truncated cone, which is divided into four equal parts by making a cross on the surface, and throwing out two diagonal quarters, which are again reduced in size, made into a second similar cone, and treated as before. This quartering and crushing is continued until a half-pound sample is obtained for fire assay. Great care must be observed when removing the different quarters to see that all the fine dust is swept up and added to the pile each time, as otherwise very defective results will be obtained. The rest of the ore is returned to the main ore bin Samples taken in this way from the aprons of the self-feeders are likely to give a more correct average, having been crushed, and the coarse and fine duly mixed. Samples should be taken at regular intervals from the pulp *with the water* that has passed over all the plates, and also from the concentrators.

Tailings samples should be taken at stated intervals by passing a vessel across the entire width of the discharge, where they leave the mill, without permitting any to flow over, and gathering at each interval an even amount. This is allowed to settle in a bucket and the clear water then poured off carefully or drawn off with a siphon. The residue is dried and thoroughly mixed, and several packages of 5000 to 10,000 grains each weighed out. In some mills, tailings samples are obtained automatically, using their current as the motive power for the sampler, which works by intermittently deflecting a spout through the tailings where they finally drop from the sluices, obtaining the sample across the entire section of the current.

To ascertain the amount of slimes in the tailings sample, put one of the packages into a bucket, add water and stir it. After settling two or three minutes, pour off the muddy water into a separate vessel. Repeat this operation until the water comes off clear; add a little powdered alum in the vessel containing the muddy water, and, when the mud has all settled, draw off the top water carefully and evaporate the remainder. Dry the washed sands of the sample, and pass through different sized screens, weighing the different amounts as they have passed, and assay each size. This will show where the greatest loss is sustained.

To ascertain where the loss in sulphurets occurs, it is sufficient to pass one of the 10,000-grains samples through a 60-mesh wire screen; weigh that which passes through and that which remains on the screen, and pan out each lot carefully by itself, from one pan into another, as long as sulphurets can be recovered; then weigh each batch separately.

The use of 10,000 grains is recommended, as every 100 grains is 1%, and each grain is $\frac{1}{100}$ of 1%; it is also a convenient size for obtaining accurate results. By using pulp samples instead of tailings, the amount of sulphurets in the ore may be ascertained.

If the sulphurets assay $75 per ton, and the quantity per ton is 1.7%, the value of the sulphurets in one ton of ore is found by multiplying $75 by 0.017, which would be $1.27 per ton. If the loss of sulphurets in the tailings is 11 grains out of the 10,000 grains sample, and the value of the sulphurets is $75 per ton, then multiply $75 by 0.0011, and the value of sulphurets in the tailings is found to be $0.0825 (8¼ cents) per ton of tailings.

*(To be Continued.)*

* Bulletin No. 6, California State Mining Bureau.

## The Fauvel Process.

The Fauvel Gold Recovery Co. held a meeting in London, Eng., on the 13th ult., at which Mr. Fauvel gave the following description of his process:

Mr. Chairman and gentlemen, I will endeavor to describe the process in which we are interested. I may, first of all, say that the work has cost me about nine years, and nearly twice as many thousand pounds, in the endeavor to bring it to a state of simplicity and efficiency, combined with economy. The great trouble which the mining community has suffered from in the past, has been the recovery of gold from refractory ores. Here are two classes, arsenical pyrites and sulphides of iron. In the one case we have some of the sulphide of iron reduced to powder. In the other we have some of it as passed through our furnace, and a third box contains some that has passed through the fire, air and water process. First, we get the refractory pyrites; then we get the roasted ore, which is of a dark reddish color; and, finally, we get it after it has been through the water of a pale salmon color. In this ore we had nearly 10 ozs. of gold when treated. When it passed through the furnace the gold was still there, but of the ore only two-thirds in bulk, and when it came through finally we had extracted 97 per cent. That, with our original furnace, was very satisfactory indeed, to me, but in those days it cost much more than it does now. The embodiment of many improvements, suggested by experience, are thrown into the present structure of the plants, and details have gone to America. Mr. Fauvel here exhibited some diagrams of his furnace, but part of his description would not be intelligible without an illustration of the diagram itself. Continuing, he said: You see there the diagram of a longitudinal section furnace when ready for working. When the ore has passed through some form of crusher or krom rolls, it is deposited in the lower hopper, then raised by the elevator to another hopper, and by a patent automatic feeder is fed into the furnace.

Now, the furnace working is not a theory, but the embodiment of a true principle, and the demonstration of a metallurgical fact. While the ore is falling down the furnace, it meets a gradually increasing temperature, combined with a gradually increasing purer oxidizing medium. The atmospheric air is heated in the chambers round the furnace, and passed into the tower, ascending against the falling stream of ore. The ore falls down, and, as I shall show you by experiments, the refractory elements are eliminated almost instantly; and as it goes down through the tower, it gets cleaner and cleaner, until at last it is thoroughly oxidized, and the gold is left free from the film of sulphide of iron, or any other refractory element which may surround and keep it from that contact with mercury which is necessary. When it reaches the highest point of temperature—1600°—the ore falls through a shower bath of cold water, as described in the pamphlet. You can understand what takes place, and why the ore is found in such a fine powdered state after it has passed through the cold shower bath, and the temperature reduced from 1600° to the ordinary temperature of 100°; the time occupied in this work is only about two minutes. It is the act of Nature, I repeat—it is a metallurgical feat, and not a theory. The ore comes down the tower perfectly free and clean, and, dropping through the shower bath, is further reduced, the crystals separating along their natural line of cleavage. Another stream of water carries them to a series of amalgamating plates, so that by the time it reaches the end nearly the whole of the gold is recovered, and only the valueless tailings are left. The whole time occupied here is five or seven minutes. I do not think there is much reason to fear any one else doing the work quicker. The speaker here proceeded, by a simple experiment, to show how quickly the refractory elements were burnt off, leaving the rest of the ore to descend into the water bath. Continuing, he said: For simplicity, economy and efficiency, I do not think it possible for any superior process to be brought forth. We are not in opposition to cyanide, which will treat free-milling ore; our work is only with refractory ore. I went to America, and showed what I had done there, and never met with any one who could condemn the process. As to the prospects of the company, we came out at a fairly bright time, but latterly things have not been so encouraging, and recently the various parties under contract with the board have asked for an extension of time over the holidays, which has been granted. That was a judicious act, and I have no doubt the various engagements will be satisfactorily carried through.

Since the company came out hardly a day has passed in which some one connected with mining companies has not come to make inquiries about the process. There are at least forty mining companies asking for detailed particulars, with a sketch of the plant, to send out to various parts of the world, so that their engineers and managers may see whether the process is suitable for their ores or not. I have not the slightest doubt that the large majority of these companies will adopt the process. I understand, also, that Prof. Mead has entered into twenty-seven or twenty-nine contracts in the United States for the building of furnaces in different parts, and that he is about to enter into nine contracts so soon as everything has been settled satisfactorily between us. There are upwards of forty contracts likely to be entered into in America, and with thirty or forty possibly here, and some that have already adopted the process, we have a very big business on hand. I visited the Portuguese mines to see where the plant was to be erected, and came back with fresh plans for plant, suitable to the position and the ore to be treated. Several Australian gold mines, which were coming out in London, have had to wait on account of the bad state of affairs, but these companies have adopted the Fauvel process, and have made it a part of their prospectus, stating that the capital is required for the new machinery and for the erection of the Fauvel plant. There is a wealthy gentleman in the city, connected with a strong group, who is spending £6000 or £7000 in erecting a furnace in Tasmania and another in New Zealand. Another gentleman has taken up Victoria and another Queensland, and everything is encouraging for us to proceed. Assuming that only fifty furnaces were erected, the return to us in royalties would be £37,500, which would be a bad dividend; but one mining expert said to me, "I will put up a thousand plants in a corner of Colorado alone." The figure is rather big, but he no doubt meant Cripple Creek, where there are thousands of tons of refractory ore. As a matter of curiosity, and not serious calculation, I worked out what 1000 plants would mean to us—£750,000 from that corner of Colorado alone. Of the bulk of the world, eighty to ninety per cent are refractory. The other ten or twenty per cent are free milling. The former are for us to deal with; the latter for the cyanide or amalgamation processes. Our process is very much cheaper than cyanide, and the gold returned is purer, being worth £3 17s 6d, as compared with £3 cyanide. Our prospects are enormous, for the field is wide which is before us. The costs, I believe, can be reduced to less than 1s per ton, when the ore is rich in sulphur, and where the sulphur, when burning, supports its own combustion and keeps the interior of the furnace heated without the aid of coal, and where coal can be obtained at about 25s or 30s a ton.

## How To Make a Million.

A sprightly little sheet called *Results*, published in Chicago, devoted to advertising, gives an account of a meeting of prominent business men in St. Louis. It was, in fact, a meeting of commercial clubs of several cities, and among those present were a number of millionaires who were interviewed with the question, "How can a man make a million dollars?" and these are some of the brief replies:

George M. Pullman: "Could not tell you—really, I could not. I did not come down here to be interviewed, and anyway this is too short notice to give a comprehensive opinion."

Marshall Field: "Oh, pshaw! What do you ask such a question for? There is no general recipe that I know of, unless it be industry, economy and a cheerful disposition."

P. D. Armour: "Oh, my gracious, what a question! I have lost my patent for making money, and now don't know any more about it than anybody else. Go ask Marshall Field. He is making lots of money now."

Lyman J. Gage: "I did not come here to talk about money making. It occurs to me that men who want to make money will know how and where to proceed."

Charles Fargo: "What do you ask me for? I've got no money. Pullman could tell you if he would."

N. K. Fairbank: "I could not give you a rule, for there is no such thing in money making."

Marvin Hughitt: "Work like the devil, and hold on to what you make. A man must solve his own problem—nobody can do that for him."

Franklin MacVeagh: "Well, that is a poser. I will indorse all that Mr. Hughitt has said, however."

E. M. Phelps: "Go talk with those men who know—I don't."

Which all goes to show, adds *Results*, that the reporter went to the wrong people. He should have interviewed the "financial experts." It is clear that the reporter never did any interviewing for an advertising journal.

What does a millionaire know about making money, or a successful advertiser know about advertising? The men who have really done anything never want to tell how they did it.

---

THE Chattanooga *Tradesman* says: The copper mines of Ducktown, Tenn., are in active operation, and 1100 men are employed with a weekly pay roll of $25,000. This is one of the most renowned copper regions in the United States, outside of the Lake Superior region. The supply of copper is practically inexhaustible and the ore is very rich.

---

MINAS PRIETAS, Sonora, Mexico, reports the recent discovery in the ancient mine known as La Brojuda, situated between El Zubiate and La Colorada, of a body of rich ore which assays 1435 ounces in silver per ton. The property is owned by the Minus Brothers.

## California's Mining Possibilities.

The following is from the Boston, Mass., *Journal* of December 17, '95:

Prof. McCaw of California says that if California had $100 to put into the development of the lode for every $1000 put into the Witwatersrandt she would easily run $50,000,000 to $100,000,000. Hayward, at the Utica-Stickles mine, in Calaveras county, turns out five times as much as the Robinson, the most noted of the African mines. The Utica-Stickles employs 700 white men at $2.50 to $3 a day, while the Robinson has 2500 Kaffirs at 30 cents a day. The African miners, however, have hurt California. They have taken away most of the competent mining superintendents, giving them $8000 to $10,000 a year and expenses, on a contract running several years. Young men, however, are being trained, and California will continue to supply the demand, as well as take care of herself.

California, as Prof. McCaw puts it, has been but scratched. It has never been explored, except for but a narrow belt. The mother lode is 100 miles long, running through the counties of El Dorado, Amador, Calaveras, Tuolumne and Mariposa. It consists of a number of parallel veins, trending northerly and southerly, and dipping easterly. It is not one vein, as might be supposed, but a series of veins, 50 to 1500 feet apart, the series having a width of one to four miles. In developing it has been the custom to sink as near the center of the lode as possible. The formation of the country rock on the west half is generally slate footwalls and greenstone hanging walls. In the center it is generally a double-block slate—that is, both foot and hanging. In the east half the foot is slate and the hanging a transformation called diabase, but really serpentine or quartzite.

Calaveras county has the Utica-Stickles turning out $800,000 a month; the Sheep Ranch, which has a vein with an average of but 12 inches, but which has turned out millions, developed to a depth of 1200 feet; the Utica, with a vein of 100 feet between walls, which is growing richer with depth. The town of Angels is the principal camp. It has a population of but 2000, but it is booming wild, and contracts are being let to sink shafts 1000 to 1500 feet, at intervals on the lode. Some of the shafts are as deep as 2300 feet, with pay bottom. A great many of 1000 feet are being sunk. The ore is of low grade, but it is in immense quantities, and handled at a minimum cost, water power being used for hoisting and to run the mills. The Zeila, near Jackson, in Amador county, has an average assay value of only $4, but the ore body averages 40 feet in width and the chute is 1000 feet long, and gradually growing richer with depth. It now has ore for 30 years ahead blocked out.

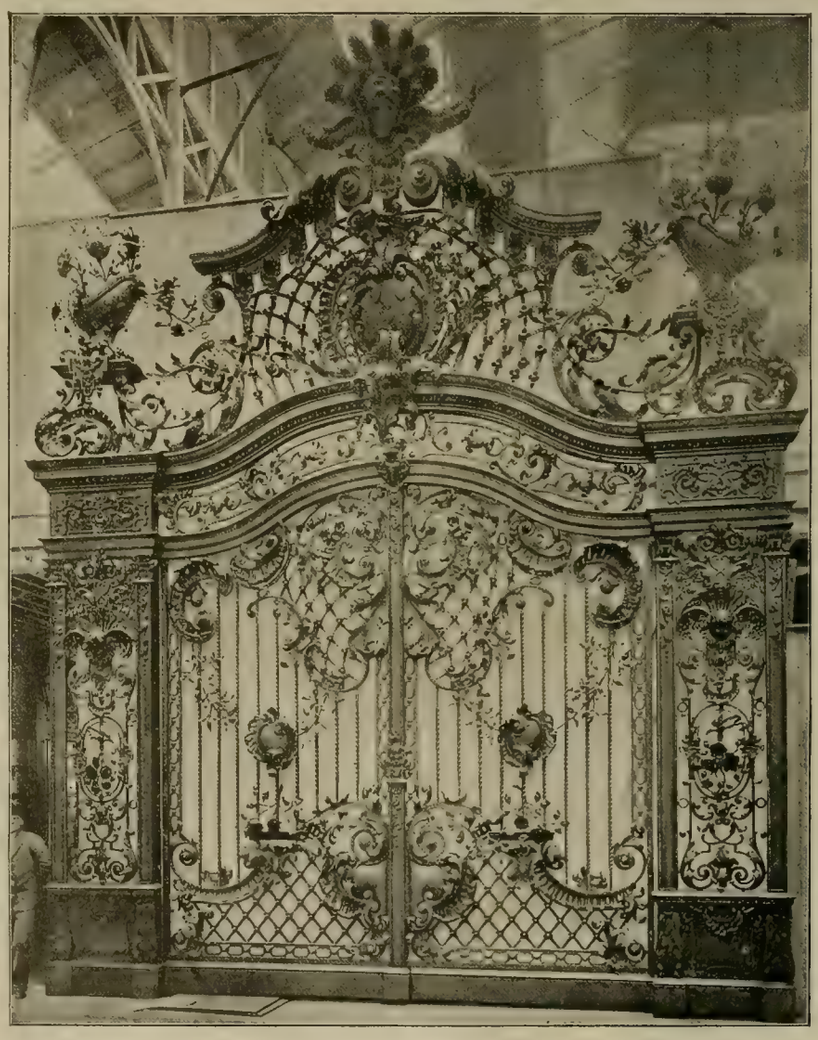
## How It Is Worked In London.

The process of floating a mine on the London market, as described in an English paper, is interesting. It is the working of this machinery, and not the yield of the mines themselves, that has made most of the enormous fortunes which have been accumulated the last few months. The company promoter buys up most of the private mining claims, as the agent of a promoting or exploitation corporation or syndicate. There are plenty of these corporations now in the field, and the profits of their operations within the last year have been in many cases almost incredible. Take, in illustration of their plan of operation, the case of a single mining claim: They have paid the discoverer, say, $10,000 in cash for it; they send a few men and sink a test shaft thirty or forty feet on the reef and take out several tons of ore. An expert examines the mine and reports, and some of the best specimens of ore are assayed. The result is embodied in a prospectus and printed in all the London newspapers. Subscriptions are invited for the shares in the Struck-It-Rich mine, "capital £100,000 ($500,000), of which 60,000 £1 shares are offered to the public at par." It is explained that 40,000 fully paid shares and £20,000 in cash are to be paid to the vender company. Public subscribers are notified that they must pay 2s 6d upon application and the same sum upon allotment of each share. Five shillings more per share will be due a month after allotment, and the balance of 10s as called for by the directors.

If the promoting company is a concern in which the public has confidence—that is, if it has engineered similar deals successfully before, and if the directors named also command respect, then, if the experience of the last six months holds good, the public subscriptions will call for 300,000 shares instead of the 60,000 offered. In that case the public subscribers will receive one-tenth to one-fifth of the shares they applied for, or perhaps none at all. Such a demand for shares, of course, insures their advancing to an immediate premium, and as the directors can allot to whom they please among the subscribers, it is natural that their friends are supplied first. It happens almost daily, therefore, that shares in new companies are quoted at a high premium as soon as or even before they are issued.

# Mechanical Progress.

### A Drill Sharpening Machine.



The man who sharpens the drills for the miners is one of the most important employees on top of the mine. This work has been done by hand so long that it would seem as though there were no other practical way. In 1868 E. W. Walton invented a drill sharpener, and in 1879 another invention of like intent was made, but so far as we are aware neither was ever put into practical shape. An American named Myers has recently brought out an invention that is said to be a success in this direction. He is in Johannesburg, South Africa, and reports from there say that Myers' machine will sharpen a star bit. At a recent trial of the invention worn steel star bits were made hot in the forge, put into the machine, and in a few seconds were practically re-made, and true to gauge. Plain bars of drill steel were similarly heated in the forge, and were fashioned into new bits as rapidly as the old were re-made. The machine is so simple that it is difficult to describe. It is practically an almost solid wheel 16 inches in diameter, and 4 inches wide, turned at a speed of 300 revolutions a minute. The inner part of the wheel is fixed firmly as a sort of axle, and the outer part turns freely on it by means of a series of eight friction rollers, each of the diameter of about an inch and a quarter, this being the whole space between the outer wheel and the inner fixed center. In this center are four spokes which converge to the center, and when closed down leave a hole or opening on the one side in the exact form and size of the bit to be forged, on the other considerably larger. These spokes each protrude into the roller path between the outer wheel and the inner fixed center to the extent of less than the sixteenth of an inch. As the outer wheel revolves the rollers revolve with it, and in their passage press down these spokes, the rollers being so placed that each of the four spokes is pressed inwardly for the small distance simultaneously. The inventor describes these spokes as dies working in guides, and coming to a common center. By their simultaneous action they hammer the steel all over, improving the quality and making the drills all of one size. Dies, or as they are called above, spokes, can be supplied of various patterns, and any bit of any shape can be fashioned, star, rose, chisel, or any other, with equal facility. One machine can deal with all the steel and bits that two forges can make hot, and if there was only a man who could keep up the rapid supply of heated steel, could turn out completely thirty forged bits an hour. These while still hot would then after the forging be passed on to a similar machine in which, instead of forging, the edges of the drill would by a similar succession of blows be cut sharp. It was marvellous, says the report from which we quote, to see this small machine forging the bits from the bar-steel, and these virtually doing the work of a steam hammer. At 300 revolutions a minute, and with the eight rollers, no less than 2400 blows are delivered on the steel every minute. The machine is at present quite in the rough, this being the first occasion on which it had been really suffered to appear beyond the inventor's workshop. It has much to accomplish and many trials to pass through; but if it can continue to work as it did at the trial, it has unquestionably a great future.

### Silver from Silver Bromide.

Silver is usually recovered from silver bromide wastes, incident to photographic processes, by mixing them with nine-tenths their weight of calcined sodium carbonate, and fusing in a crucible, whereby carbon dioxide and oxygen are given off. Metallic silver gathers at the bottom of the crucible, and a double salt of sodium carbonate and sodium bromide floats on the top as a clear liquid. On cooling the crucible down to a red heat the silver solidifies, and the flux, still in a liquid state, may then be easily poured off. The silver thus obtained is of a fine white color. The flux usually has an intense yellow color and still contains about ten per cent of silver. The latter may be obtained (Pharm. Centralh., xxxvi, p. 632) by mixing the flux with plenty of water and stirring occasionally to facilitate solution of the flux. The unchanged silver bromide is allowed to settle, washed by decantation, and preserved for a subsequent operation.—Scientific American.

### Ornamental Iron Work.

In San Francisco and elsewhere mechanical progress is manifest in many forms of use and beauty that elicit admiration for their artistic production. Ornamental iron work is no new art.

ORNAMENTAL IRON WORK: GATEWAY OF FINE HAMMERED WORK.

The work of Quinten Matsys in Antwerp has for centuries been admired, but that artistic Belgian blacksmith did not take his art with him. In the progress of the mechanical arts the ability to skillfully wield a hammer has kept pace with other pursuits, and in every country are found artisans who, with no other appliances than an ordinary blacksmith's outfit, can reproduce in forged and hammered iron the graceful tracery and delicate outline of fragile form that one would presume applied only to more facile material; this, too, combined with strength and tenacity. Herewith we illustrate one of the finest pieces of forging in the world. It is a hammered iron gateway originally viewed and admired by thronging thousands at the Chicago Exposition, and now in position at the entrance to the grounds of Gen. Joseph T. Torrence on the Lake Shore Drive in Chicago. While no engraving can give a full idea of the original, yet the one on this page is a good portraiture of the elegance and richness of detail characterizing this magnificent piece of hammered iron work. It was manufactured by Winslow Bros., art metal workers, Chicago, Ill., to whom we are indebted for the accompanying illustration.

### Production of Alumina from Clay.

An important contribution appears in *Comptes Rendus*, by Heibling, indicating the production of alumina from clay, so as to be absolutely free from silica and readily convertible into sulphate, etc. To this end the clay is thoroughly incorporated with a mixture, in equal parts, of ammonia and potassium sulphates, in such proportion that three molecules of ammonium sulphate may be present to every molecule of alumina, and the mixture is made into hollow bricks, which are then heated in an oven at 270° to 280° C. At this temperature both gaseous ammonia and acid ammonium sulphate are given off, which immediately reacts with the potash salt present, acid potassium sulphate being formed—the latter, at the above temperature, combining with the alumina of the clay to form alum. The alum is finally extracted from the bricks by means of water and freed from iron by recrystallization, and the insoluble silica remaining behind may be employed in cements. Granular alumina is prepared by spreading out the powdered alum in a thin layer on shelves arranged in a vertical tower, which is traversed by the warm, moist, ammoniacal fumes derived from the brick oven. Thus the alum is transformed *in situ* into alumina, retaining the form of the original powder, and potassium and ammonium sulphates.

### Car Wheels on Track Curves.

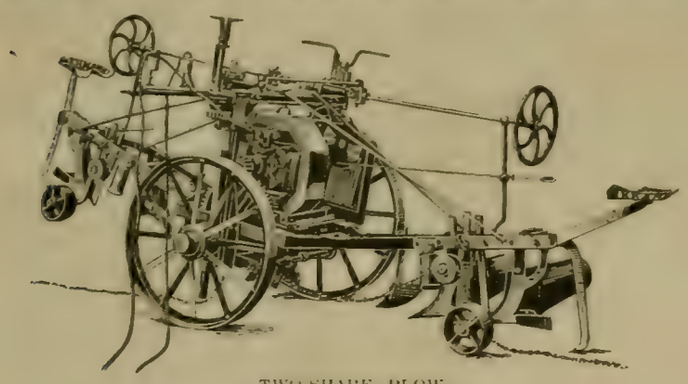
When an ordinary wagon turns a street corner, the wheels on the inner side of the curve travel a shorter distance, and hence revolve a trifle slower for the moment than do the outer wheels. But on a railroad car both sets of wheels must move together, being affixed to the axle, and therefore on a curve either the inner or outer ones must slip. The resulting friction and resistance adds to the amount of power otherwise required to haul the load. Several years ago an inventor tried to improve street-cars by leaving the wheels free to turn on the axle, somewhat as do those of a wagon. But the idea never came into favor or public use. Such a plan involves difficulties more serious than those he sought to remedy. Francis Blanding, of Putnam, Conn., proposes a new solution of the problem. He would secure the wheels to the axle, as now, but cut the latter in two in the middle, so as to allow unequal rotation of the halves. The flange would keep each wheel from getting too far away from its mate; and to prevent the inner ends of the severed axle from wearing each other down, Mr. Blanding would fasten to each section a stout collar, which would abut against a sieve inclosing the middle portion of the axle. Of course, this would introduce friction at a new point, and whether the consequent loss of power would be less or greater than that due to the slip of wheels on curves under the present system is an interesting question.

### Confidence Will Win.

"If the vast sums of money which have been put into the development of the South Africa gold mines had been invested in California mines, this State would be producing twice as much gold as South Africa."

Thomas J. Barbour, mechanical engineer with the Risdon Iron Works of San Francisco, and the man who secured the first franchise for an electric street-car line from Los Angeles to Pasadena, descanted thus on one of California's partly-neglected industries, at the Hollenbeck, yesterday.

"Here we have a mother lode of gold which has been conclusively proven to be 284 miles in length, and yet capital goes to the wild extremity of the Dark Continent for investments in gold mines. It is true that here it is necessary to go down about 1000 feet to reap a big reward for money put into the business, but our California mines are so much more convenient that there can be no comparison drawn with the mines of Africa. Capital is very obtuse sometimes. California mining has always paid, and confidence is all that is needed to make it pay in the future.



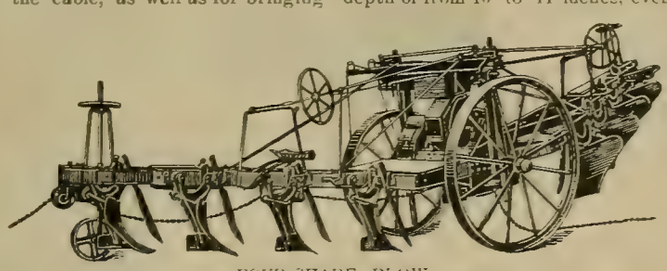
"Take Los Angeles and Pasadena, now, as examples of what confidence can do when it has the handling of money. Five years ago, after I secured the first franchise for an electric line to Pasadena, the idea was ridiculed, but, even then, it could be seen that the growth of Los Angeles and Pasadena would soon justify the risk. This section of California has simply kept pace with its great possibilities, and men of foresight and keen business judgment have been quick to grasp the opportunities in a section favored with great natural resources and a climate created by nature in her most genial mood."—Los Angeles Times.

HEREWITH is a formula for making a superior bearing metal for railroad car brasses, and other heavy stock, in which a small amount of silicon is used as a flux: Copper 80 pounds, tin 12 pounds, lead 8 pounds, silicon copper 2½ pounds. Phosphorus is also used for fluxing copper and bronzes, and accomplishes about the same results. It is more effective than aluminum for this purpose, but not so effective as silicon.

# Electrical Progress.

## The Electric Plow.

Steam plows, in conjunction with locomobiles, have long shown great advantages over manual and brute labor, and now electricity invades this as well as other industrial domains. Herewith is illustrated the latest and most successful attempt to utilize electricity in farming, as now in operation in the vicinity of Leipsic, Germany. Consul Doederlein writes that he has visited the factory of Zimmerman & Co. there, from whom the accompanying cuts have been secured, and says that in actual practice the apparatus here portrayed is in every way satisfactory, doing good work at less expense than any other form of power hitherto employed in turning over the ground.



TWO SHARE PLOW.

A stationary engine or locomobile transfers its elementary power through an electromotor to the plow, the motor being mounted on the plow itself. The anchor shaft of the motor sets in motion a double spur wheel, which, in turn, drives a pinioned shaft.

A chain extended over the field and held taut at both ends by triple ground anchors is worked by this pinioned shaft, which draws the plow along the chain across the field. On reaching the end of the chain, the plow is tilted to the other side, and the reversal of the current sets the plow in motion in the opposite direction. In returning, it deposits the chain sideways ready for the next row of furrows. A laborer, by turning a lever, draws up the three ground anchors, and thus sets the traveling wheels affixed to the anchor axles in motion, so that the anchors are moved to the next furrow. The motor tightens the chain before starting.

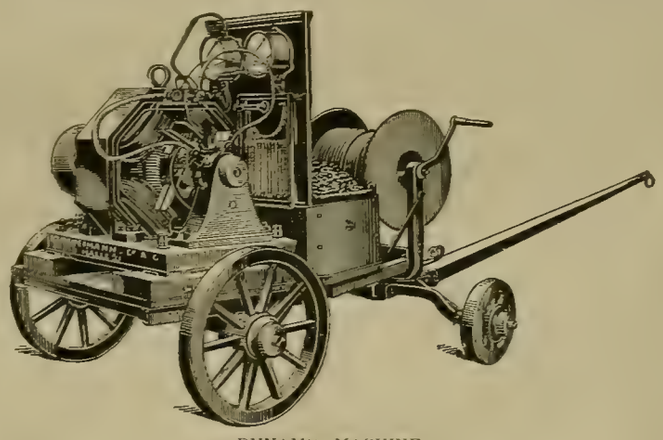
The source of power may be any ordinary agricultural locomobile of from 8 to 12 H. P. It drives the dynamo, which is placed on a car.

This car also serves to transport the gauging apparatus for measuring the strength and current of tension, a reel for the cable, as well as for bringing the plow to the field. One end of the tipping plow is fastened behind this primary station car by means of a cramp iron, while the guiding roller in the rear is placed so as to rest on the ground and guide the plow. As soon as the locomobile is set up accurately by means of brake blocks, the dynamo car is placed straight before it, fastened into the ground by means of an anchor placed opposite to the belt tension; the driving belt is placed over the driving wheel of the locomobile and the disc of the pulley of the dynamo machine, and the primary station is then in working order.

FOUR-SHARE PLOW.

Two cables, corresponding with the two poles, serve to transfer power from the dynamo to the electromotor. One end of this pair of cables is affixed to a projecting bar of the plow, and moves backward and forward with it, like a pendulum, while the other pair of ends is secured to the dynamo machine.

The friction of the cable on the ground is avoided by means of light cable carriages fitted with insulating nippers. These carriages follow each motion of the plow automatically, as the wheels are fitted into forks which, pivoting in every direction, answer to all the movements of the plow.



Five or six such cable carriages, according to the length of the area to be plowed, are easily watched by a boy, who has to take care that, in reversing the motion of the plow, they follow such motion.

A tilting plow for small farms is fitted with two shares each. In front of each of these is a forecutter to prepare the ground. The frame and body, as also all other parts of the plow, are of iron and steel, so strongly made that it is powerful enough to cut furrows to the depth of from 10 to 11 inches, even in heavy, clogging ground. The plow may also be fitted with underground looseners, which follow the plow and loosen the subsoil to as much as 15¾ inches in depth, but do not turn it over.

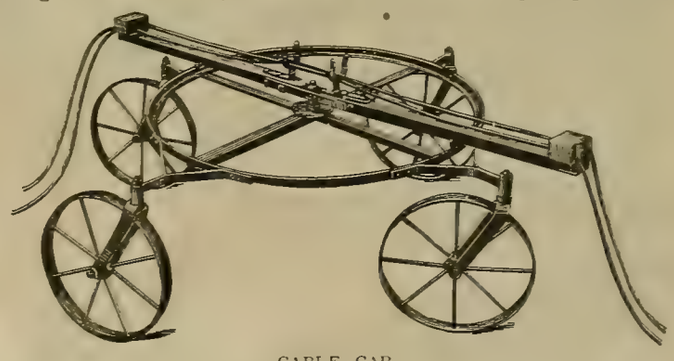
The iron frame of the tipping plow bears in the center shaft an arrangement on which are two main wheels of different diameters; these are adjustable perpendicularly and turnable sideways. The adjusting or placing of the wheels is effected from the driver's seat by means of a spiral and wheels, so that the driver has the plow under control. An electromotor is mounted on the plow frame. A spur wheel is wedged on to the motor's anchor shaft. The motion of the electrometer is transmitted from this spur wheel with the aid of an intermediate appliance to a roller with a chain wheel. The dimensions of this appliance, which is made of cast steel, are so determined that the compass of the chain wheel receives a lineal speed of 70 meters per minute. The plow is, therefore, moved at this rate of speed across the field by means of the stretched out chain, the links of which are seven-sixteenths of an inch thick.

ANCHOR.

DYNAMO MACHINE.

The chain is directed on to the chain wheel by guiding rollers in such manner that the tautly stretched chain end is constantly striving to raise the forward end of the plow as well as to press the rear end into the soil. This results in a steady and certain progression of the plow.

For extensive operations the aim is to produce an electric plow capable of plowing 4 to 5 hectares (1 hectare= 2 471 acres) to a depth of 35 centimeters (13¾ inches) in ten hours. As this requires about 35-horse power, the ordinary locomobiles at hand are not available.



As in the case of small farming, the operation is comprised under three headings: the primary station, the transmission of power, and the plow with electromotor.

A dynamo machine of the requisite power is attached by driving belts to the stationary engine, being, of course, fitted with the necessary appliances for gauging the force of the current and tension. Water power where available in the necessary degree, may be very advantageously used to drive the dynamo machine, which can be done either by taking the power direct from the turbine or the water wheel or by indirect beltings.

Here, again, it is essential that the elementary machine be prevented, by the introduction of suitable regulators, from too much variation in its revolutions. In like manner, when land is being reclaimed or improved, the stationary power must be used rationally. Thus, instead of driving machinery of the pumping works, a dynamo machine should be used to produce the electricity, which can be conducted thence to any desired distance and for any wished-for purpose. It is only in such manner that a stationary engine can be intelligently turned to account in husbandry, inasmuch as uninterrupted use materially reduces the cost in creating steam, both per hour and per horse power. Moreover, as the electric current is available, the electric plow may, with the aid of electric light, be worked all night.

Two bare copper wires are carried from the dynamo machine to the field which is to be plowed, in like manner as telegraph wires are borne, namely, on poles. According to the size of the field, this connection by copper wire is either brought to the further end of the field, or where its length is 800 to 1000 meters (2625 to 3281 feet), to the center division line of the field's length. Both the cables are affixed to the copper wires by nippers in such a way that they can be easily moved backward or forward. These cables are borne by the cable carriages and move forward or backward with the plow like a pendulum.

A three or a four-share plow is used for farming on a large scale. It is made on the same principle as the two-share implement, already described, only proportionately stouter. The frame of the tipping plow, which carries the cast-steel plowing contrivance, as its dimensions, etc., necessitate, is made of strong iron and carries a proportionately powerful electromotor. This, by means of an intermediate wheel gear, sets a chain wheel in motion, which, in turn, draws the plow along the chain stretched across the field. Both the chain and its ground anchors are like those used with the two-share

CABLE CAR.

plow, only corresponding in power to the demands made upon them. These anchors require two men to turn them. One of them may be the plow driver, while another man is stationed at each anchor to help in tipping the plow and shifting the anchor.

The experiments were made on heavy, binding, loamy, clay soil near Halle-on-the-Saale. A ten-horse power locomobile, fitted with a very exact regulator, was used, with the following result: Gauges showed a current tension of 110 volts and a current force of 60 to 80 amperes, an average of 8000 volt amperes, this being equal to the capacity of the locomobile up to eleven-horse power; two furrows 60 centimeters broad by 24 centimeters deep (23⅝x9½ inches) at each plowing; power gauge varied between 600 and 700 kilograms (1344 and 1568 pounds), giving a mean of 650 kilograms (1456 pounds) a resistance of from 45 to 48 kilograms (100.8 to 107½ pounds) per square decimeter (3.937 inches) of the cross section of a furrow.

At a progression of 0.9 meter per second, 7.8-horse power was made really useful, so that the loss of power between locomobile (11 electric horse power) and plowing (7.8-horse power), arising from transmission of power and tooth and chain friction, was 3.2-horse power.

With eight acres in ten hours, on heavy soil, with a depth of 24 centimeters (9.24 inches), the cost would be $1.29 per acre.

Here in California the subject is of considerable economic importance. Wheat growers must compete with the world, and somewhere on the globe wheat is always being harvested. On the great plains of the Sacramento and San Joaquin may yet be seen electric plows built and operated on the same general principles herein outlined, with less resultant cost than under the present system.

---

A great electrical exposition opens in New York the first week in May, under the auspices of the National Electric Light Association. It will last a month. The exposition is to be held in the New York Industrial building, which was built about five years ago for the distinct purpose of trade shows of this nature. It has cost about two million dollars. It joins the Grand Central depot on the east, and switching facilities have been extended into the building from the New York Central railroad. There is in the building 500,000 feet of exhibit space, and the construction is such that the floors will carry the weight of an ordinary steam railroad train. Among many interesting features will be the running of Tesla motors with a current generated at the big Niagara plant. Mr. Tesla has agreed to superintend the arrangement, and has guaranteed the current will be delivered to the exposition over 400 miles away from the turbine shafts at Niagara.

---

THE manager of an electric street railway may now determine at any instant, without leaving his office, whether the cars of his system are running regularly, whether there is a stoppage at any point, how long the stoppage lasts, how many cars are blocked, and when running is resumed. This is made possible by a special chronograph, the use of which was first suggested about two years ago by Superintendent George Baumhoff of the Lindell Railway Co. of St. Louis. The apparatus consists primarily of a sheet of paper moving at a uniform rate under a series of pens or points, operated by electromagnets, each magnet point representing a point on the road. Each time a car passes this point on the road it makes contact, and the magnet point on the chronograph pricks the paper. It is found convenient to use a roller driven by accurate clockwork at the rate of one revolution per hour, each revolution moving the paper four inches. A line running on a one-minute schedule will show fifteen cars or pricks to the inch, under each magnet point, a five-minute schedule three to the inch, and so on. A break of three inches would show a stoppage of forty-five minutes, and even regular dots would indicate correct running at that point of the road. When filed away the daily chronograph sheets become a permanent record of operations.

## Scientific Progress.

### Twentieth Century Telegraph.

The system recently proposed by P. B. Delaney for quickening the intercommunication of messages between cities by the substitution of cheap telegrams, which would be answered in a few hours, for the present mail system has caused much uneasiness to some of the existing telegraph companies, who are quite satisfied with the plant that they have established at the cost of much time, trouble and expense. One of the officials of the Western Union says that Delaney's method of transmission is too fast for him, and he wouldn't know what to do with it if he had it. An electrical journal, by way of comment on this assertion, says: "How a telegraph service can be too speedy is not quite clear; but one of these days the fact will dawn on some people that the telegraph is too slow." That this remark is justified is seen in the figures recently published on the extraordinary extent to which improved telephone service is eating into the profits of the telegraph companies. Unless certain radical reforms and improvements are introduced into the telegraph service within the next few years it will run a great risk of being practically superceded by the telephone, which is already found a quicker and very much more desirable means of intercommunication. Such a system as the Delaney would unquestionably have a most important influence on future developments in telegraphy. Mr. Delaney gives some excellent reasons for believing that it will be well established before the beginning of the new century. He says that speculation as to the future of the electric telegraph would be within extremely narrow bounds if the question of Government control were eliminated. It may be somewhat remote, but it is hard to avoid the conclusion that the Government will not always draw the line as to the vehicles to be employed in carrying the mail. It now uses over 3000 railway cars on 150,000 miles of road, and keeps 6000 clerks on the move, traveling in crews 140,000,000 miles a year, during which time 9,000,000,000 pieces of mail matter are handled. About 300 mail cars are wrecked, a dozen clerks are killed, and 150 injured during the same period.

The total expense of the postal service is about $75,000,000 per annum, and the department not far from self-sustaining. How can so vast a system ignore the difference between railway and electrical speeds. A car travels 40 miles an hour, a current 200,000 a second. The automatic telegraph now projected will send a message of 16 words from New York to Chicago every second, and 50 words—about the average of an ordinary business letter—in 3 seconds. If time be reckoned as the basis of value for business correspondence, which will appeal most to the business man, a letter occupying 24 hours covering 2000 miles for 2 cents, or a telegram going the same distance in 3 seconds for 15 cents? Mr. Delaney asks: "Would not a very large proportion of business communications warrant the extra 13 cents?" The public desire for quick facilities of communication is strikingly evident in the avidity with which it has taken advantage of the quick delivery system instituted by the postoffice a few years ago. Every such letter is an evidence that the writer is willing to pay 10 cents in order to expedite the delivery of his letter a half hour. If these letters could be telegraphed for, say, 15 cents, or 3 cents more than the ordinary and extra postage, there can be little doubt that nearly all would go that way. Already Italy is about to make the experiment of 5-cent telegrams. It seems inevitable that sooner or later, either in a monopolistic or a competitive way. It cannot go on restricting the postal service to hauling actual paper by rail. Among other of its beneficent aims its mission is to place its people in communication by the quickest means at the lowest cost, and for this purpose an up-to-date telegraph will answer.

---

THE oft-mooted idea of utilizing the earth's internal heat for power and domestic purposes is assuming practical shape in Hungary. It appears that for many years the artesian wells there existing have supplied hot water which has been used for public baths and buildings, and for warming greenhouses and winter gardens. The plan is now being seriously considered, it is stated, of sinking such wells to 12,000 or 15,000 feet. It is thought that the water from such a depth would have a temperature of about 200 degrees C., and should, therefore yield steam for power as well as the heat required in buildings.

---

FOR a gas-light unit Herr Blondel proposes as a unit of illumination the light received by a square metre of surface at one metre distance from a source of light equal to one decimal candle, or 1-20 Violle's platinum units. This he calls a "lumen." It is equal to the brightness per unit of surface (one lux) multiplied by the surface.

---

A REPORT to the French Academy of Sciences states that seven well equipped expeditions have been sent out to gather material for a magnetic map of the earth.

PRACTICAL BOOKS FOR PRACTICAL MEN.

*Just Published:*

ECONOMIC MINING.

A Practical Hand-Book for the Miner, the Metallurgist and the Merchant. By C. G. Warnford Lock. 668 pages, 175 illustrations, 8vo., cloth, price..$5.00

*CONTENTS.—Prospecting; Power; Drilling; Blasting; Shaft and Well Sinking; Ventilation; Lighting; Drainage; Mining and Winning; Haulage and Hoisting; Reducing; Concentrating; Non-Metalliferous Minerals; Metalliferous Minerals; Index.*

*New and Enlarged Edition:*

THE METALLURGY OF GOLD.

A Practical Treatise on the Metallurgical Treatment of Gold-Bearing Ores, including the Process of Concentration and Chlorination, and the Assaying, Melting and Refining of Gold. Fourth edition, enlarged to 678 pages, with about 250 illustrations and numerous folding plates. 8vo., cloth.....$5.00

*Recently Published:*

MINERALS:

And How to Study Them. A Book for Beginners in Mineralogy. By Edward Salisbury Dana, with more than 300 illustrations. 12 mo., 380 pages, cloth, $1.50

*Now in its Sixth Edition:*

THE PROSPECTOR'S HAND BOOK.

A Guide for the Prospector and Traveller in Search of Metal-Bearing or other Valuable Minerals. By J. W. Anderson. Sixth edition, thoroughly revised and much enlarged; cloth.....$1.50

The Mechanical Engineer's Pocket Book.

A Reference Book of Rules, Tables, Data and Formulæ, for the use of Engineers, Mechanics and Students. 1087 pages, gilt edges, pocket-book form, morocco.....$5.00

The Wonders of Modern Mechanism.

A Resume of Recent Progress in Mechanical and Engineering Science. By Chas. H. Cochrane. Fully illustrated. 8vo., cloth.....$2.00

*Fully Up to Date.*

DYNAMO-ELECTRIC MACHINERY.

A Manual for Students of Electrotechnics. By Silvanus P. Thompson, D. Sc., B. A., F. R. S. Fifth edition, thoroughly revised and rewritten up to date. 832 pages, 520 engravings and 20 folding plates, 8vo., cloth.....$5.50

THE PRACTICAL MANAGEMENT OF DYNAMOS AND MOTORS.

By T. B. Crocker and S. S. Wheeler, with a special chapter by H. A. Foster. Illustrated. Second edition, revised and enlarged. 12 mo., cloth.....$1.00

*Any of the above sent by mail on receipt of the price. Catalogue free.*

# Mining Summary.

## CALIFORNIA.

### Amador.

ZEILA.—*Ledger*: Messrs. Wardner, Gillian and Dwyer have now about constructed a plant behind the Zeila mill, very similar to the Gates' plant at the Kennedy mine. They expect to stop most of the metal which has in the past been going down the creek in gold sulphurets form too fine to save on the van-ners.

### Butte.

E. H. Gale of Oroville, has bought the interest of S. Titus in the Big Sam mine, south fork of Feather river.

The shaft on the Magalia mine is down 500 feet. The old works of the mine are about 70 feet distant from the bottom of the shaft, so that a tunnel will have to be run for this distance when the shaft is completed. Twenty men are employed.

Machinery for the Bootjack mine at Bangor is now being set up.

Both of the Bishop mines have been bonded by the Burback Company of North Bloomfield.

### Calaveras.

The Pioneer mine, situated in the Smith Flat district, has been bonded to James Kinny for $8000. The bond is for one year, and work of developing the property has already begun.

A Gwin mine correspondent of the Amador *Republican* says: The new drilling machine works very satisfactorily. Owing to poor workmanship in the welding of the drill stem, the end next to the drill parted and left the drill and piece of stem in the hole. Having no suitable fishing tools to recover the drill, Superintendent Thomas put miners to work to sink a small shaft thirty feet to where the drill is lodged.

Another strike of rich gravel is reported in the North Star mine, Mokelumne hill.

The Tulloch estate has bought back the Tulloch mill and mine, paying $6000 therefor.

RICH ROCK.—*Prospect*:—We learn that very rich rock was struck in the Pure Quill mine the fore part of this week. The shaft is down something like 80 feet, at which depth a crosscut was started. No more than 8 feet of this crosscut had been penetrated when rich ore was revealed. It is said that 60 sacks of this rock taken out will represent at least $30,000. The ore carries a good quantity of sulphurets and is not of the pocket character. The mine is owned by the Godbe Company and superintended by Harry Routledge.

### Del Norte.

Henry C. Langrehr has been examining and has located the group of Native Trilby mining claims, which, together with the Klamath Bluffs and two other smaller claims that the company have made arrangements to secure, will make in a solid body 480 acres hydraulic ground. If the deal is made machinery will be put in and operations begun.

### El Dorado.

(Special Correspondence).—C. W. Kenny, of San Francisco, has bonded the Sam Kaiser mine, near greenwood, and is sinking a double compartment shaft.

The Henry Welsh mine, on the Taylor belt, is being opened under bond.

J. Ramsdell has started a 5-stamp mill on his claim in the neighborhood of Greenwood.

Rock taken from the Blakemore mine, 14 miles from Placerville, mills $15 per ton. The shaft is 70 feet, and the drift on the ledge—which averages 3 feet—is 40 feet.

J. H. Tong, at Clarksville, has reached a depth of 70 feet on the Cram & Berry mine, his own property. The ore averages $20 per ton.

The Starlight is rapidly becoming one of the rich producers in the county. A recent 60-hour run with a small mill yielded $1,300. This is owned by San Francisco parties.

The Sacramento Development Company is reopening the old Snyder mine, 3½ miles south. The shaft is down 140 feet. The ledge, showing low-grade ore, is 23 feet wide.

Properties are now being bonded on 12 and 18 months in all sections of the county.

The Independence, adjoining the Starlight, is a famous old-time producer. Authentic records show a production of $150,000. There are three shafts of 65, 70 and 100 feet. The property is owned by N. W. Mountain, of Placerville, and others. It is now receiving the attention of outside capital.

Hoisting works have been erected on the Larkin, and depth is being rapidly attained.

New hoisting machinery is being placed in the Grand Victory, to fill the increasing demand following upon the new ore veins discovered. This and the south extension known as the Salisbury will form one of the greatest and lasting producers of the State.

The ten-stamp mill at the Kenna mine on Mt. Gregory is finished.

Thomas Swansborough takes charge of the Channel Bend gravel mine as foreman of the underground work. The mine is in a bar of the American river, about thirty feet above the present channel, and is located about two miles from Volcanoville. Eight men are employed at the present time and the property is owned by the company operating the Taylor and Idlewild mines.

### Humboldt.

At the Alexander placer mine at Orleans, last week, a landslide carried away and destroyed about 150 feet of pipe.

### Los Angeles.

The Los Angeles Petroleum Smelting and Mining Company has incorporated for the purpose of working ore from a mine purchased by them, the crude petroleum now being taken from wells around Los Angeles to be used as fuel for the smelter furnaces. The company has in contemplation the erection of a custom ore smelter in Los Angeles, which will use this crude petroleum as fuel; the crude petroleum can be purchased in Los Angeles for 50 cents a barrel; three barrels of petroleum equal one ton of coal for smelter fuel purposes.

### Lassen.

The *Mail* predicts considerable activity at Diamond Mountain, as soon as Spring opens. There are now three mills there, two of which have ten stamps each, the other five. These running steadily will crush considerable rock and if indications are to be considered of value, at least another ten-stamp mill will be erected next Summer.

### Mono.

The Con. Pacific, U. P. and Trust mines have been bonded to J. A. Brown and N. Tobias. The bond runs to July 1st, and Brown must keep a force of men at work until that time.

### Mariposa.

Captain Thomas Couch tells a Butte paper that it is his belief that Mariposa and Calaveras counties in California are capable of a production from the quartz mines alone that in the next five years will equal the amount of the national debt.

### Modoc.

The following doubtful item is from the *Surprise Valley Record*: "We are informed that an English mining company now has a complete smelting outfit on the way to this valley, and will put it up at the Soldier Creek mines. An assay of thirty-three per cent of good tin is said to have been made from the ore sent back. We hope that the report is true, and that a full force of men will soon be put to work."

### Nevada.

TO LAY THE PIPE.—*Transcript*: Men arrived here yesterday from San Francisco to put in place the heavy iron pipe that is to carry water from the flume to the power house of the Electric Power Co., out on the South Yuba river. The men were sent up by the Risdon Iron Works, which firm had the contract to furnish the pipe and put it in place. It is expected that everything will be ready to start the big dynamos on the 3rd of January.

THE CON. WYOMING CO. TO DISSOLVE.—*Herald*: A special meeting of the stockholders of the Con. Wyoming Mining Co. has been called for the purpose of dissolving the company as a corporation and surrendering its franchise.

The Wyoming mine, situated on Deer creek about a mile and a half below Nevada City, has been a great mine (and is now), and paid its owners handsomely. The principal stockholders were John M. Buffington Sr., A. G. Gurnett, Charles Pace, Marchutz & Cantrell, Isaac Hecht and H. L. Van Wycke. H. X. Thompson was one of the original owners of the mine, which was located in '51 and has been worked almost continuously since, and he built the first mill for it.

Thomas Mein, who is now superintending a great mine in South Africa, was one of the Wyoming's first superintendents. He began the development of the property and conducted it for six or eight months. John M. Buffington was then installed as superintendent, and ran the mine from 1877 to 1889, when it was shut down. During that time Mr. Buffington took out over a million dollars for the company, with a mill of sixteen stamps. He continued in charge of the mine, doing a little prospecting now and then, until '94, when the mine was sold to the Champion Company. Mining men generally are familiar with the details of the sale. The Con Wyoming Co. sued the Champion Co. for $200,000 damages for ore extracted from their ground. Plaintiff won the suit in the United States Circuit Court at San Francisco. Defendants then compromised by selling the property to the Champion Company for $80,000. The latter company paid for the mine in monthly installments and has recently made the last payment, so that the Con. Wyoming Co. has no longer any excuse for existence.

The contest between J. Glasson and A. Henderson et al., involving the Woodpecker Gravel Mining Company's placer claim, near the W. Y. O. D. and Pennsylvania quartz mines, is finally decided by Secretary of the Interior Smith in favor of the Woodpecker G. M. Co.

### Orange.

Action to foreclose mortgage has been brought by C. H. Gray against E. H. Miller et ux., to secure payment of an indebtedness of $8,965.35. The mortgage is upon the Red Butte, the Africa, the Lometa, the Prize, the Gray Eagle, the St. Louis, the Washington, the Colorado and the California mines, a one-half interest and a one-third interest in the Alabama, Ironwood mining district, Orange county.

### Placer.

The Erie Mining Company are running a tunnel at their tailings claim at Bear river dam, near Colfax.

The mill at English Mountain mine sixteen miles north of Emigrant Gap, has ceased active operations till next Spring. Five men remain and will work on the lower tunnel during the winter.

An assessment of one cent per share has been levied on the Haskell mining stock.

*Republican*: The Cinnamon Bear mine is situated three-fourths of a mile from the Lost Emigrant. The vein is from two to ten feet wide and has been traced for half a mile. The ore assays 17 ounces in silver, 31 per cent copper and $3 in free gold. The mine is at an altitude of about 6000 feet. The country rock is of porphyry formation.

Rich ore was struck in the Doig mine last week, and the development work is being vigorously pushed. This mine is one of the properties of the Gold of Ophir Mining and Development Company, recently organized by B. M. Berry.

### Plumas.

THE TAYLOR DIGGINGS.—*National-Bulletin*: Work progresses at the Taylor Diggings, near Genessee Valley, owned and fitted up by Chicago capitalists, represented by Mr. Clapp, superintendent.

The water supply is drawn from Taylor lake, two miles southeast of the Lucky S mine. In the flood season this lake is over a mile long and about 300 yards wide. Its depth is not known. At the lower end of this lake it is proposed to build a dam ten feet high, and by tunnel at the lower end to tap this lake fifty feet below the present level of the water. This will enable them to use most of the water husbanded from the rain and snows.

During the past season a ditch nearly fourteen miles long has been cut. Its carrying capacity is 2500 inches of water. Much flume work also has been done, and large quantities of iron pipe manufactured. Of this pipe, 3500 feet is to be riveted together and laid this winter.

The extensive area of gravel deposits to be worked by the Chicago Company is said to be a part of the big ancient river channel extending from Light's canyon across through Grizzly ridge.

Works to restrain debris can be erected at very small expense, the topography of the country below the mine being very favorable for such work.

Probably $20,000 has already been expended in fitting up the mine, and a considerable amount will yet be used in completing the work planned.

### Riverside.

*Sun*: In the Perris district, Riverside county, are located some mines that are making good records, the most prominent among them being the Santa Rosa. This mine was purchased about twelve months ago by some Colorado men from ex-Governor Blaisdell.

The main shaft was then 225 feet deep, with but little development work done. The company immediately erected a ten-stamp mill and commenced development in a systematic way.

They soon found a ten-stamp mill inadequate to handle the output of the mine, and last month commenced the erection of ten new stamps.

The new mill started to drop the stamps December 20th and was a success in every way. A contract has been let to sink the main shaft 1000 feet. The boiler was changed two months ago to use oil, which is brought from Los Angeles in tank cars, the consumption being about 800 gallons per day.

The Santa Rosa is without question one of the most promising mines in the State.

The proprietors of another prominent mine in the same district, the Good Hope, are working their twenty-stamp mill on pay ore, most of which is taken out by lessees, the company having found it more profitable to lease to the miners than to pay them regular wages.

Several mills are in course of construction in this district, from which good reports will be heard.

The big English grant is located but a short distance from the Santa Rosa mine, and is being thoroughly investigated by H. B. Vercoe, who is the representative of the London syndicate owning the grant. He has in contemplation the erection of a large stamp mill in the spring. He has just finished a millrun of fifty tons of ore, taken from his different discoveries, and it was so satisfactory that the mill will undoubtedly be built.

### San Diego.

*Sun*: The mining outlook in southern California is particularly brilliant just at present. All the biggest mines in this section were overlooked twelve or fifteen years ago, through the fact that at that time the silver, lead and copper mines were more certain and attractive to capital than low grade gold mines. It was impossible to interest capital in mines containing from $4 to $5 in gold when silver mines all over the West could be obtained running from $50 per ton and up in silver. And there were many disadvantages years ago connected with mining in southern California, such as high transportation, high price of living, expensive labor, scarcity of water, danger from Indians in Arizona, and in many cases even where it was of sufficient value to be worked, it was of such a rebellious nature that no process was known with which to work it.

But now everything is changed; there are different processes, such as cyanide, chlorination and many other processes by which every class of ore can be profitably worked, provided there is sufficient value for economic working.

There are railroads, good labor at a reasonable price, living is as cheap as anywhere in the United States. Water has been discovered in various places, and the fact that lead, silver and copper have fallen to such a low price has driven all the miners who formerly operated silver, copper and lead mines, into gold mining, and as all the high grade gold mines in the mother lode and other sections of the West are held at prices at which only capitalists of the largest means can own and operate them, has brought the low grade gold mines to the front.

There is now in southern California the largest gold mill under one roof in the State. The mine on which this mill is working, the Gold Cross, located at Hedges, San Diego county, was examined at different times by mining experts, but declared to be too low grade to be operated successfully.

The present company is milling over 300 tons per day of ore that yields to the stockholders a handsome profit over and above working expenses. They have two pipe lines running from the Colorado river, thirteen miles distant, which furnish the mill and camp with an ample supply of good water.

There are several other strong companies investigating the ledges in the vicinity of the Gold Cross, and within twelve months there will be more mills in operation.

TOURMALINE VEIN.—A tourmaline mine has been discovered near Escondido by C. Chapman and J. M. Best in the employ of H. C. Brown of the Consolidated Mining Co. The crystals are white, green and black. The white is almost as brilliant as the diamond, being six-sided transparent crystals, with the green and black spars running through them, and when polished will make beautiful jewels. The green crystals are what are known as the three-sided crystals, some of them being one-half of an inch in diameter and running in length to as high as five or six inches. The black crystals are considered the lowest grade and are of no great commercial value.

### Shasta.

MINING SALE AGREEMENTS.—*Free Press*: An agreement between John J. Franck, John J. Kelly, Timothy Madden, Jr., and W. G. Van Matre with David B. Hunt was filed with the county clerk and recorder December 23rd, wherein the first named parties agree to sell to the last named the Alexander, Queen of Diamonds, Lucky Jack and Gould quartz mines; also the Thomas Greene dwelling house, the Queen of Diamonds mill site and quartz mill of five-stamp capacity, and water rights to 160 inches of the waters of Summit gulch. All the property is situated in French Gulch mining district, and is to be sold for $25,000 on or before July 16th, 1896.

An agreement between Mrs. L. M. Fox, J. C. Johnson, W. G. Van Matre, V. L. Fox, Mrs. Eliza Simpson, Mrs. Luke McDonald, Mrs. Josie McConnell, Mrs. Mary J. Reineke, Mrs. Kate Everhart and William W. Matthewson with David B. Hunt was filed with the county recorder, December 23rd, 1895, wherein the first named parties agree to sell the J. I. C. quartz mine, in French Gulch mining district, for the sum of $12,000 on or before July 16th, 1896.

### Sierra.

*Union*: Gravel has been struck in the Lucky Dog tunnel, which was run in some 360 feet. This tunnel lies between Forest City and the Mountain House, and shows that the Bald mountain gravel channel extends down that way. The North Fork main tunnel has been steadily pushed ahead and will probably reach the channel by spring, when Forest City will again be prosperous. Things have a brighter look in that section already.

In the Hope quartz mine at Alleghany stringers of quartz that is heavily sulphuretted have been struck. They have 280 feet yet to drive before reaching the old works, the ore shoot in which was very rich.

There is a likelihood of the old Rainbow mine at Alleghany being opened up again. Several hundred thousand dollars have been extracted, and more than $150,000 have been spent looking for a lefthand shoot, which is known to dip to the right. A comparatively small amount of money will now set them right on the way to success, for the Rainbow shoot of ore when worked was very rich.

Work is progressing at the El Dorado and Plumbago mines, and the outlook is very encouraging. Rich developments are expected before long.

### Siskiyou.

The Seiad creek mine of W. T. Grider is running with a good supply of water.

Work will be continued during the winter on the old Spencer tunnel, on the north fork of Humbug. The ledge will be struck at a depth of 400 feet, where it is expected to be rich and permanent.

The Portuguese Bar mine, owned by R. E. Neil of San Rafael, is in readiness for the winter run. G. A. R. Lewington is superintendent.

At the Montezuma drift claim, Scott bar, Hunt & Nesbitt have been taking out about $300 a week for the last five months.

The Columbia Mining Co. at China creek is ready to commence operations as soon as the water season opens. Lee and Silva are managers.

A force of twelve men are employed on the Commodore mine—the property of Quigley, Humphrey & Billups—and two arrastras are constantly running. The ledge is about two feet wide and will average about $30. Since the discovery of the Commodore, last July, some $3000 has been taken out, and $75,000 is reported as being in sight.

The Siskiyou Mining Co., on Clear creek, below Happy Camp, last week turned the water into their new ten-mile ditch for the first time. This is a very valuable property, and will no doubt soon be ranked among the best gold producing mines in Siskiyou county. F. D. Fraser, the energetic superintendent, deserves great credit for the able manner in which he has handled this large enterprise.

The Seattle Co. at Seiad have their new ditch well under way. They propose completing about four miles of it this winter, and now have a force of seventy-five men working on it. When completed this ditch will take the water from Thompson creek. A. A. Booth is manager. Woodville is the name of the new place.

The Gold Nugget hydraulic mine, near Sawyer's Bar, has commenced operations, and others will soon be started up.

Work has commenced on the Chinese Oak mine, near Happy Camp. Two giants are at work now, and others will soon follow.

The McCauley mine, on French Bar, near the mouth of Scott river, still continues to pan out well. The main tunnel is about 250 feet long, and the work is being pushed.

The drifting claim of B. F. and C. Maplesden, at Hamborgh Bar, still continues to turn out well.

The flume of the Siskiyou Mining Company, at Clear creek, which is nearly eleven miles in length, has had the water turned on, and is naturally causing some work on account of land slides. Two giants will be in operation next week.

Improvements are going on at the Bunker Hill mine. Messrs. Hughes and Gilbert are owners.

Preparations are being made to turn the giant loose early in February in the Wingate Hill mine, on the Klamath, about eight miles below Happy Camp. This property is owned by G. B. Temple, who recently sold the Bunker Hill mine to Hughes & Gilbert for $10,000.

Work on the Narcissus quartz mine, owned

by Egli & Dawson, is being pushed with favorable indications. The quartz in sight shows considerable free gold, and they expect to strike the main ledge before long.

The Gum Boot mine of Simon Bros., Sheller and Humphrey, seven miles from Scott Bar, the ledge averages from four to eleven feet in width and shows considerable free gold. It is a new claim just being opened.

The river claim of G. A. Hicks, Martin Andrews and Thomas Miner is still being worked. This is one of the largest and most substantial wingdams ever put in the Klamath river. The claim is just below the mouth of Scott river, in a section that has always paid well.

*Journal:* The Henshaw Bros.' mine, at Greenhorn, closed down. On the 21st ult. the pump broke, which caused a suspension of work, and when the pump had been repaired the men refused to go to work until they had been settled with. The mine has not been started up yet, but it is expected that everything will be settled soon, and work will be resumed.

Mrs. N. E. Hilt, owner of the Harrison quartz ledge at Bailey Hill, in the Siskiyou mountain foothills, has men at work running a long tunnel to tap the shaft sunk some time ago on that lode. The tunnel was started at head of west fork of Bogart gulch, about the 1st of December, and is now is about seventy feet, with nearly water enough already coming from the tunnel to operate a five-stamp mill. She thinks the tunnel will have to be extended about 250 feet to tap the lode, which will also be about 250 feet below the surface. This ledge has always shown good prospects, and it is expected will prove a rich gold yielding property when the tunnel is completed to get out plenty of quartz.

The Chinese Company, working the Benz Bar mine at Honolulu, Klamath river, still continues operations, notwithstanding the severe cold weather of the past week. They struck a rich crevice last week, from which they realized $1,800 in one day, and feel hopeful of taking out a big pile of gold before freshets prevail to drive them out. The gold in this claim is the output of Dutch creek, and sells at about $15.75 an ounce, while the gold from the old Kanaka claim just above the mouth of Dutch creek sells at $17.50 an ounce.

The Spengler Brothers have been obliged to suspend work in their claim at mouth of Humbug creek, owing to the water supply freezing along that stream, and especially in the deep snow on the Humbug mountains.

The chinese working the claim in Klamath river, just above the mouth of Humbug creek, are working day and night shifts, and have huge bonfires blazing continually to keep warm. They are undoubtedly realizing good pay, else they would not work during the storms and freezing weather lately. This claim shows a regular rock bed canal, with perpendicular walls on each side, in which there is a great mass of boulders and gravel, interspersed with coarse gold.

The winter work at the Schroeder quartz mine on Deadwood mountain, is carried on with good success in getting out quartz for crushing. There is only about a foot of snow on the mountain at present to cause any interference in the communication, although the snow causes no trouble with the work in the tunnels.

### Trinity.

AT TAYLOR'S FLAT.—A. Pelletreau's Highland placer mine is being put in shape and is expected to be in operation by next February. A ditch, about a mile and a quarter long and carrying about 500 inches of water, is now completed, while the flumes are in course of construction.

The last rains furnished sufficient water to some of the miners along the Trinity river to commence mining. The big French company's mine at Junction City has started up.

W. Huestis is now fixing up the Don Juan mine and operations will begin before long.

### NEVADA.

The *Enterprise* hears that A. Livingston has purchased the interest of William Zirn in his three marble quarries in Pine Nut. Many experts are of the opinion that at a little depth it will turn into gold-bearing quartz. Almost immediately under the surface the marble assumed a crystallized form.

#### ON THE COMSTOCK.

CHOLLAR.—From the stopes above the south drift from No. 2 crosscut, 450 level, we are working north on the 7th floor. The pay bunches continue to look about the same.

In the stopes above No. 2 crosscut, work has been confined to the 3d and 4th floors.

From these points we have saved and shipped to the Nevada mill during the week, 72 tons and 1800 pounds of ore, the average of the battery samples being $29.63.

We are making repairs to the main shaft; also to the main west drift on the 550 level.

POTOSI.—In the stopes above the north drift, 850 level, work has been confined to the 10th, 11th and 12th floors, from which we have saved and shipped to the Nevada mill for reduction 135 tons and 300 pounds of ore, the average battery assay of which was $28.53 per ton.

From the old workings from the south drift, 550 level, we have drifted south along the hanging wall 30 feet on the 4th floor, which shows old fillings and bunches of ore.

We are repairing where most needed.

We have shipped two bars of bullion of the par value of $5549.

OCCIDENTAL. — 550 level — The southwest drift from northwest crosscut has been extended five feet; total 143 feet; the face is in hard porphyry. 650 level.—The north drift from northwest crosscut is in sixty-two feet and continues in low grade ore. The upraise from north drift is sixty-two feet, having been extended eighteen feet during the week. The top is in quartz, clay and porphyry, the quartz showing value. 750 level.—The northwest crosscut from north drift started at a point 310 feet north of the main winze has been extended nine feet; total sixty-five feet; face is in hard porphyry.

ALTA.—825 level—The south lateral drift, 825 level, was extended nine feet in quartz, carrying bunches of good ore; total length, 189 feet. The north drift same level was advanced eight feet in hard porphyry carrying seams of quartz of low assay value; total length 160 feet.

#### ORMSBY COUNTY.

J. C. Stanley, mining in White Horse district, seven miles from Wadsworth, has brought some quartz to Reno from the White Horse mine, which is prospected by a shaft to a depth of 100 feet. The samples are from the bottom of the shaft and contain wire gold.

#### LYON COUNTY.

*Times:* The barge which contains the screening plant of the Carson River Dredge Company has been hauled down the river and pulled up on the bank for repairs. The company intends to commence operations again as soon as the ice leaves the river.

#### LINCOLN COUNTY.

The Pioche *Record* says all prospectors who have been through the region agree that the country from DeLamar south to the Colorado, and beyond, is a good field for gold prospectors. The biggest developments thus far are those of Ferguson district.

### OREGON.

#### DOUGLAS COUNTY.

(Special Correspondence).—The history of this mining district (comprising Starveout creek, with Hogan creek as main feeder) is a repetition of the gold mining camps on the Pacific coast since 1850—up and down. Interest was again awakened in 1893, and with the beginning of the season of '94 about thirty-five men were ready to begin work.

Beginning farthest up the creek we have the claim of J. L. Cotton, whose output was over $400 in coarse gold pieces from $21 to $128.

Adjoining below is C. C. Grimes' claim, his output being about $500, with one $144 and one $176 nugget.

The next claim belongs to C. C. Wilkeson, and owing to sickness but little work was done by him.

This brings us to the claim of P. H. O'Shea. This is one of the best on the creek. His ground covers the junction of the east and west forks of the creek and is quite extensive. He leased the ground to A. M. Britt and N. Peterson, reserving the right to work over tailings, and the total taken out was about $1500.

All of the above claims were worked with pick and shovel, the surface ground sluiced off and the bedrock cleaned up with a light head of water through small boxes.

The next property is the 100 acres owned by S. W. Miser and leased to the Dyer Bros. of Myrtle Creek. This was the only hydraulic claim on the creek last season. Their dead work was extensive and output small.

Below we have the claims of J. McCormack, J. Bailey and W. Wiley. Being from three to four miles below the source of coarse gold, their claims average well in fine gold.

This season Messrs. Cotton, Grimes, Wilkenson and Dyer have pipes playing on the bars, an improvement over last season.

#### JOSEPHINE COUNTY.

OPERATIONS RETARDED.—*Oregon Mining Journal:* The work of destruction commenced a week ago by a dynamite fiend on the bridge of the Siskiyou Mining Co., over the Illinois, was this week completed by the elements. The snows and rains of the past week sent an immense body of water down the river, with the result that the bridge was lifted from its supports and carried down the stream. This loss is most embarrassing to the company at this time, and will retard operations for several months. Supplies will be taken across the river on a wire rope, and in the meantime the 1000 tons of copper ore on the dump will be at once smelted.

A PROMISING PROPOSITION.—*Mail:* There is probably not another mining proposition in southern Oregon, practically undeveloped, that is promising a brighter future than the one now being opened at Bolt by the Lance Mining Co. The property which this company owns comprises 700 acres and is located almost squarely at the door of the Bolt post-office. Work is now being pushed for early and earnest working of the mine. There are now eight or ten men at work. One hundred and fifty sluice boxes, twelve feet long, are being built, 5000 blocks are being sawed, a sluice way 2300 feet in length is being made, and a tunnel from Foots creek to the Rogue river is being put through, this latter for dump grounds. The company will put in 2000 feet of pipe and will have plenty of water, during an average wet season, to run eight months in the year. A reservoir, with a capacity of from two to three million gallons, is also being made. From this the company expects to be able to run eight hours. The ground is very rich—in no pan which has been tested has there been found less than five cents in gold. The average of a yard of dirt where work is to commence is seventy-five cents. Three miles of water ditch is also to built; this work is to be done by contract. Work is expected to commence with pipe and giants about February 1st.

### WASHINGTON.

#### OKANOGAN COUNTY.

The Spokane Mining Company at Golden, Okanogan county, will soon start up their works. There is a 10-stamp mill and concentrators on the ground. Sixty thousand dollars have been spent in machinery and development on these properties. The Tribune mine will resume operations. This mine is also equipped with a stamp mill and concentrators.

### BRITISH COLUMBIA.

One of the remarkable mining events of the year in the Similkameen country was the find of copper on the Tulameen on Wolf creek, about seven miles from the Anglo-American Company's property. The place is known as Copper mountain. There W. R. Brown and partner from Kettle river staked three claims —the Helen, the Gardner and the Discovery. The vein is reported to be 400 feet wide and can be traced through three mineral claims, or 4500 feet, and assays have been got from 40 to 76 per cent copper, 15 and 16 ounces silver and $6 in gold.

AT ROSSLAND.—*Miner:* The receipts at the office of the mining recorder in Rossland from January 1st to date amount to $24,430. This does not include the total provincial revenue from this district, as taxes on real estate and personal property are paid at Kaslo, but during the last year this amount would be a mere trifle, though next year it will be a considerable item. It does not, of course, include customs collections, which go to the Dominion revenue.

Two thousand quartz claims and four placer claims have been recorded in the Trail creek mining division since the first of last January. Probably 100 more quartz claims located prior to that date have been kept alive by assessment work, making a total of 2100 or more quartz claims alive at this date.

Certificates of work to the number of 215 have been issued on these claims during the same period. Five certificates of improvements have also been issued. Applications have been made for certificates of improvements on a great many more claims, but owing to adverses and other causes the certificates on these claims have not yet been obtained.

The *Miner* also says: Orders have been received at Trail to proceed at once with the erection of two more reverberatory furnaces, which will have the result of giving the smelter a capacity of 300 tons a day from the start. Nothing could speak more eloquently of the development of the camp than this. When the smelter was first planned it was to have a capacity of from 50 to 100 tons a day, but before the buildings could be erected it has been found advisable and necessary to increase the daily capacity to 300 tons.

RIVER BOTTOM GOLD.—*Kamloops Sentinel:* F. W. Young, of Lytton, who has been working on the problem of obtaining the gold from the bottom of swift streams, and the result of his study has been an apparatus of entirely new features, which has just been patented in Canada and the United States. This new machine he will operate on the Fraser, above the Cottonwood, not far from Quesnelle. As a result of his work at Lytton, Mr. Young concluded that the largest amount of gold was lodged from two to three feet below the boulders, which formed the bottom of the river. To remove large boulders would be out of the question, and to accomplish the required purpose he has devised a means by which the bottom to that depth is agitated without necessarily raising the stones. From the bow of his scow a heavy boom projects, through the end of which, and working on a swivel, passes a heavy casing, enclosing the suction pipe of the pump. At the bottom of this pipe is a heavy piece of iron resembling a knife blade. When in operation the pipe is lowered to the bottom of the stream, drawn, like a plow, toward the scow by chains carried to a hoisting gear on the scow. This loosens the small gravel and sand, which is drawn through the suction pipe and pump to the sluice boxes. The pipe is carried forward from the scow again by another cable, and is thus kept going backward and forward all the time. This part of the machinery is operated by two pony engines traveling on a circular track, so that the dredge can be moved 25 feet backward and forward, and has a swing of 180 degrees. The pump is a powerful one, and delivers the water and gravel into the sluice boxes on one side or other of the scow, where, with quicksilver the gold is saved. While a clean-up is going on upon one side, the other sluice can be used, so that the machinery is kept constantly employed. The scow is held in place by speeds opposite the center of the boat, and stern wheels furnish the motive power. The scow to be built at Quesnelle will be 26x80 feet, or over all, with stern wheel and boom, 126 feet in length. The owners of the machinery and grounds will be known as the Pittsburg & Cariboo Gold Dredging company.

#### VANCOUVER ISLAND.

Supt. McQuillan of the Duke of York mine at Alberni, is in this city to examine hydraulic machinery for the company's mining properties. He says there are two hydraulic claims, each employing ten men, and numerous other locations which have gold, both quartz and placer. There are two companies operating the hydraulic mines, but the combined investments do not exceed $30,000. Men have taken up claims and are waiting for money. The country is not rough, nor in any sense disagreeable, and the work can continue upabated the year round so far as weather would interfere. In August or September the supply of water might give out, but at other times there is any amount of water. The men are now engaged in building the flumes, and these will not be required for a greater length than one and one-half miles. His company pays good workmen $2 a day and board. Alberni is in about the middle of Vancouver Island and is fifty miles from Victoria and seven miles from boat landing.

### UTAH.

"LIQUID GOLD."—Idaho *World:* Mrs. Gerard Huppertz brought from Utah some of the handsomest specimens of copper ore we ever had the pleasure of gazing upon. It is rich in gold. This ore is from the Mammoth, Utah's greatest producer, with possibly one exception. The copper the ore carries pays all expenses of mining, transportation and reduction, leaving the gold clear profit. The mine has been developed to a depth of 1300 feet, and, strange to say, is perfectly dry. The Mammoth carries a form of gold that is not metallic, which, she says, is termed there "liquid gold"—perhaps for the want of a better name. The same form of gold in found in Deadwood, Dak., and is also termed "liquid gold" there. This is the fifth form in which gold is found non-metallic, or at any rate, if it is metallic those who still hold to the theory that gold in nature is always in the metallic form are unable to upset this new theory.

PARK CITY.—*Record:* The new dynamo, with which to increase the present horse power of the Ontario electric plant, and the Pelton water wheel have arrived and are being placed.

The slime tables for the Daly-West concentrator have arrived. The mill will not be ready to start before the last of January and may not be started on a steady run until warm weather comes, as it is cold at the Daly-West, and the mill is not yet provided with steam coils or other means of keeping the frost away.

S. L. *Tribune:* Director W. S. McCormick has returned after a visit to the Bullion-Beck and confirms the report of improved ore bodies in the old bonanza, which has now distributed dividends amounting to $1,950,000, and which promises additional dividends as developments progress. The recent strike on the 600-foot level, says Mr. McCormick, has proven up as well as was predicted, and is yielding some very good ore, while in the winze between the 800 and 900-foot levels the size of the ore body has increased until it is a very large one, but of a grade inferior to that which is produced above.

A report that an Eastern syndicate had made an offer upon the basis of $1,000,000 for a controlling interest in the Ajax is denied by Henry M. Ryan, through whom the negotiations at this end of the line are going on. The facts are that a telegram was received by Mr. Ryan from Chicago, announcing that representatives of a foreign syndicate whose attention had been drawn to the Ajax had signified their readiness to put $300,000 into mines.

### MONTANA.

A Helena dispatch says: Montana produced in metals about $47,115,000 during '95, taking the value of the silver at the coinage rate and estimating the last two months of the year on a pro rata basis. The official report of the assayer for this office will not be ready until some time in March, but it is believed that the figures given will not vary more than a few thousand from the real amount. The production of gold was $4,100,000; of silver, 4,500,000 ounces; of copper, 212,000,000 pounds, and of lead, 24,500,000 pounds. The output of copper is estimated as being 65 per cent of the production of the United States. The receipts of bullion at the Helena assay office during '95 were 10 per cent greater than last year and 47½ per cent greater than during '93.

The Stone Creek Copper Belt Mining Co. is incorporated by Butte men to operate copper properties at Stone Creek in Madison county, and to concentrate the ores, lease, purchase and develop tunnels, etc.; capital stock, $200,000; trustees, J. M. Montgomery, G. Fitschen, R. A. Carder, A. W. Barnard, J. F. Beck.

Coal mines have been opened up near Missoula recently and are being operated by Missoula people.

THE ANACONDA.—The *Inter-Mountain* has it from good authority that the Anaconda has earned nearly four cents per pound on all the copper produced in 1895, and in addition has been spending thousands of dollars in machinery, new electrolytic works and in sinking its principal shafts. It is believed that the profits of 1896 can be forced up to five cents if desired, which would leave a surplus of over $1,000,000, after paying a ten per cent dividend.

### IDAHO.

Dan Reber, owner of the Golden King mine in the Dixie district, near Mountain Home, said to a Boise *Statesman* reporter recently that his mine was now under option and would probably be sold within a few days. "I have the largest body of ore in Idaho," said Mr. Reber, "and if the mine is not sold I will prepare to treat 100 tons per day by the cyanide process by the first of March. I have sunk a shaft of 210 feet to the ledge and run two levels of about 300 feet each. The ledge is sixty feet wide and will average $10 per ton. In one of the levels we have struck a streak in the ledge of eighteen feet in width that averages $20 per ton." Mr. Reber stated that development work had been suspended on the Golden King pending the negotiations for a sale, but that a large force would be put to work within a short time.

CŒUR D'ALENE CAMPS.—The are about forty men at work in the Mammoth.

The Consolidated Tiger and Poorman is employing about 125 men, the Tiger being run night and day. Work is progressing on the tramway connecting the Tiger shaft with the ore bins at the Poorman mill.

At the Standard mine on Canyon creek there are 80 men employed. The Campbell tunnel is in 800 feet. This will require a total length of 2587 feet to cut the lode, which it will intersect at 436 feet in vertical depth below the Banner tunnel.

At the Gem sinking is the only work in progress. They have just made a record of 85 feet in 30 days. The shaft now lacks 60 feet of the third level, when a station will be blasted out and a full crew of about 130 men put on. This will probably occur some time in February. The property now employs 35 men, all told.

The Hunter mine at Mullan has closed down for the winter.

The owners of the Wyoming are doing some development work this winter. They have a tunnel 100 feet long and several crosscuts and raises, all in ore.

The Morning is working about 90 men, and is running from 220 to 240 tons of ore through one side of the concentrator daily.

Work on the Standard mine in the Cœur

d'Alenes is suspended. New machinery will be installed which will double the output of the property. The new tunnel will be the largest in any mine in the northwest and will be wide enough to accommodate three tracks. This mine is the most remarkable producer of any in that section. In October it paid, clear of all expenses, $23,000, and in November $35,000.

The product of the Last Chance mine, near Wardner, is now about 600 tons a month. After March 1st the product will be about 1000 tons a month.

SALE OF FLORENCE QUARTZ CLAIMS.—Grangeville *Free Press*: J. S. Rhoades and J. P. Fitzgerald have sold the Ozark quartz claim in Florence to Messrs. Gilbert, president of the First National bank of Moscow, Jacobs and McCrea of Kendrick for $10,000. The purchasers have contracted with Mr. Fitzgerald to do 100 feet of tunneling at right angles at the end of the tunnel now on the property. If the tunnel work shows up the property as expected machinery will be taken in this winter.

ON SNAKE RIVER.—Boise *Statesman*: A. H. Butler has returned from Froman's ferry, on Snake river. He has just completed the big barge for E. H. Lewis. On the barge is an immense engine which will furnish power for the pumping apparatus, the idea being to pump the gold-bearing sand from the bottom of the river. The machinery has the capacity to pump and treat 2500 yards of dirt a day. It is expected several other barges will be put on the river this year. Mr. Butler has also been working his claim near Parma with a small force of men. The ground goes 75 cents to $1.50 a yard. The dirt is run through sluice boxes, yielding $5 a day of ten hours to the man.

### SOUTH DAKOTA.

1000 STAMPS.—The directors of the Homestake and associate mining companies, aware of the small milling capacity compared to the ore supply, have been maturing plans for increasing the number of stamps. Additions have been made from time to time to the number of stamps already in operation, but these have only been makeshifts at best. Recently plans and specifications have been submitted to the directors at their office in San Francisco for four mills of 250 stamps each. These plans, so our informant says, have been adopted and the mills will be erected during the ensuing year. They will be located on Whitewood creek above Pluma. Our informant further says that some radical changes will be made in the method of mining; that a large area of the old workings will be caved in and the work done more from open cuts. The vein itself is known to be 600 feet in width, and at a depth of 950 feet the grade and width improves. As only an occassional fault occurs in the vein or deposit, something of its magnitude can be comprehended.

### MISSOURI.

On the 1st inst. was organized a zinc trust which is expected to unite all the zinc smelters of the country except four under one management practically, and the result will be, the promoters claim, better prices for zinc in all branches and a general revival of the industry. The money involved is about $2,000,000, which is to be furnished by New York and Connecticut capitalists. The deal was engineered by B. F. Hobart, president of the Kansas and Texas Coal Company, which controls a big zinc smelter at Pittsburg, Kan. The new company will control all the zinc smelters in what is known as the southwest Missouri district, embrazing the zinc production territory in Missouri and Kansas. Two smelters in Indiana are in also.

### MICHIGAN.

At the Ropes gold mine at Ishpeming a vein of quartz has been encountered on the sixteenth level which assays between seven and eight dollars to the ton. The quartz in the stock pile of the Michigan gold mine is being treated.

### COLORADO.

FLORENCE OR COLORADO CITY.—C. M. MacNeill, manager of the reduction works recently destroyed by fire, says: "We will not rebuild at Lawrence, owing to its not being on any railroad, and in addition, the mill has always had to lie idle three or four months of the year on account of lack of water. In all probability work will be commenced on a 250-ton chlorination plant at either Florence or Colorado City soon after the first of the year. The chances are that the plant will be located at the latter place, but it has not been definitely decided."

THE MOOSE.—At the Moose at the present time the depth of the shaft is 650 feet, being the second deepest in the camp. Over 7,000 feet of drifting has been done. Since February, 1894, the mine has paid regular monthly dividends ranging from $6000 to $12,000. The present output is about 700 tons per month.

### NEW MEXICO.

HILLSBORO COUNTY.

*Advocate*: A carload lot of ore shipped from the Richmond mine to El Paso last week gave returns of 20 ounces of silver, 7.4 ounces gold and 5.7 per cent copper, being over $170 per ton gross value. It was produced by lessees Story and Titus, and their second-class milling ores from the same chute gave returns of 2 ounces of gold per ton. Only 60 days of two men's work accomplished this result and in that short time they made more than a miner's average year's wages, besides paying a handsome royalty to the mine.

### ARIZONA.

The Yuma mine near Tucson has been purchased by the Pima Mining & Smelting Company. The work is being carried on under the superintendency of Mr. Wemple.

Montana parties have bonded the Green Mountain group of mines on Big Copper creek, near Prescott, for $80,000. Work will be pushed on an extensive scale after Feb. 1.

AROUND CONGRESS. The Congress has 340 men at work. Workings in the mine are over 1500 feet deep, with good ore in the bottom. Two large boilers are being put in to sink the shafts 1,500 feet deeper, which will give them a depth of 3000 feet.

A Chicago company has bonded some gold mines five miles west of Congress and started to work. The Cleveland and Mocker are the principal mines in the group. The Cleveland has two 75-foot shafts and a large body of quartz. The Mocker carries a large vein from 4 to 5 feet wide.

### SOUTH AFRICA.

GELDENHUIS DEEP. Under date of Nov. 23, 1895, H. C. Perkins, manager Geldenhuis Deep, Johannesburg, reports:

Geldenhuis Deep battery foundation entirely satisfactory. Foundation for second hundred stamps now under construction in precisely same manner. Lack of Kaffirs alone prevents running plant full time. Have in mine 300 Kaffirs; require 1,000. This necessitates stoping with air drills, and reduces grade of ore through breaking undue amount of waste. Have milled 7,000 tons from mine and 4,800 tons from dumps. Average assay value of rock milled, 9 s pennyweights. Recovery has been poor at first, as large amount of gold is absorbed by new plates, but returns are now increasing. Cyanide works started satisfactorily. They will give low returns first month, owing to absorption of gold by solutions and zincs.

## A Letter from John M. Wright.

TO THE EDITOR:—In Mr. Ford's letter, published on page 423 of your issue of December 28th, I note the following language, which conveys, probably without intention on Mr. Ford's part, a misapprehension of certain facts connected with the matter under discussion.

The writer, as chairman of the Legislative Committee, drafted a bill based on the Idaho-Montana Act, and presented the same to the Executive Committee for its approval. This bill became known as the "committee bill," and is the same bill published at page 402 of your issue of the 21st inst. Mr. Ralston moved that the bill thus presented be approved by the Executive Committee and forwarded to Congress for passage by that body. After considerable discussion, and before a vote was taken on Mr. Ralston's motion, Mr. Wright moved that the chairman of the Legislative Committee and the chairman of the Mineral Lands Committee be appointed a special committee to confer with the railroad authorities and ascertain their views with reference to the proposed legislation. The writer and Mr. Ralston thereupon, and in pursuance of the instructions contained in the above motion, communicated with Mr. Herrin, etc.

The following are the facts:

The Idaho-Montana Act was reported by the Mineral Lands Committee to the Miners' Association last October, and the action of the committee in presenting the Act to Congress through Mr. Caminetti last January was unanimously approved by the votes of 500 members present at the meeting of the Association.

The Legislative Committee, of which I am a member, but whose meetings I did not attend,—pursuing the policy thus outlined by the old Mineral Lands Committee and sanctioned by the Association—adopted anew the Idaho-Montana Act, and presented it to the Executive Committee for its approval at the meeting held in the maple room of the Palace Hotel, on the night of November 27th last. The bill had just come from the printer, and before the members of the committee had time to read it over, Mr. Ralston moved its adoption. Then followed a running debate on the principles of the bill, which finally settled itself down to the question of postponing action in order to confer with the railroad authorities. Although Mr. Ford had presented the bill on behalf of the Legislative Committee, he led the movement against its adoption throughout a debate lasting over two hours, while on the other side Judge Belcher and myself both strongly contended for its immediate adoption. I do not know who made the motion for postponement, but when the vote was taken there were but two negative votes, those of Judge Belcher and myself.

Shortly afterward some one, not myself, moved that Mr. Ford be appointed a committee of one to confer with the railroad authorities. The motion which I made was made then, and was in the form of an amendment, namely, that Mr. Ralston, as chairman of the Mineral Lands Committee, should be added to the special committee so that it should be composed of Mr. Ford and Mr. Ralston. This seemed to be a fitting courtesy to the chairman of the Mineral Lands Committee.

In another part of Mr. Ford's letter I note a statement that the substitute bill received but one negative vote. This is incorrect. There were no votes cast against the substitute bill.

I do not write the above for the purpose of reopening debate upon a question which is already understood by those interested, but in order that I may not be made to appear responsible for the initiation of any of the negotiations which have taken place with the railroad company, all of which have been against my judgment, my protest and my vote.

JOHN M. WRIGHT.

San Francisco, Dec. 30, '95.

## Dividends Paid.

THE Horn Silver, Utah, Mining Co. paid a 12½c per share dividend, aggregating $50,000, on the 2nd inst.

THE Napa Con. Quicksilver M. Co. paid a regular 10c per share dividend and an extra dividend of like amount on the 1st inst., aggregating $20,000.

THE Smuggler Union Co., operating at Telluride, Col., paid a $25,000 dividend of 50c per share on the 2nd inst.

# Professional Cards.

JOHN W. GRAY, Mining & Hydraulic Engineer.
Explorations, Examinations, Reports, Surveys, Maps. Development and Working of Mines. Correspondence invited from those wishing to make investments in mines or secure and develop promising claims.
Res.—923 Linden St., Oakland, Cal.

W. J. ADAMS, E. M.
PRACTICAL MINING ENGINEER.
Graduate of Columbia School of Mines. Expert on general mill work and amalgamation. Fifteen years experience. Specialties: The saving of fine gold, Vanning, Concentration and chlorination. Address: Golden King M. Co., Alleghany City, Sierra Co., Cal.

Mark B. Kerr,
MINING ENGINEER
— AND —
Deputy U. S. Mineral Surveyor.
(Formerly Topographer U. S. G. S.)
Valley Springs, . . . Calaveras Co., Cal.
Surveys executed and U. S. Patents obtained for Mining Claims, Mill Sites, etc.
S. F. address care Judson & Shepard, 402 Front.

LOUIS FALKENAU,
STATE ASSAY OFFICE,
434 California St., near Montgomery.
Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.
Court Expertingin all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

The Evans Assay Office.
W. N. JEHU, - - - - Proprietor.
Successor to Jehu & Ogden.
628 Montgomery Street, San Francisco.
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

School of Practical, Civil, Mechanical,
Electrical and Mining Engineering.
Surveying, Architecture, Drawing and Assaying.
723 Market St., San Francisco, Cal.
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
☞ Send for Circular.

F. H. HARVEY. W. S. HUTCHINSON.
HARVEY & HUTCHINSON,
GALT, CAL.,
Mining and Metallurgical Work in All Branches.
Assays, Chemical Analysis of Ores and experiments on rebellious ores for treatment by cyanide or other processes. Surveys and reports upon mining properties.

W. B. TAYLOR. H. C. WARD.
Nevada Metallurgical Works,
Established 1869.
Ores Crushed and Sampled and Working Tests Made by any Process.
Assaying in all its branches.
Analyses of Ores, Minerals, Water, Etc.
C. A. Luckhardt & Co.
Formerly Riotte & Luckhardt and Huhn & Luckhardt.
Mining Engineers and Metallurgists.
No. 23 Stevenson Street,
Near First and Market Sts., San Francisco.

Everette's Mining Office.
(Pioneer Mining Geologist's Office of the Pacific Northwest.)
MINING LAW, MINE EXAMINATIONS, METALLURGY, ASSAYING AND ANALYSIS.
"Consulting Associate Mining Attorney at Law."
Will examine and report upon "Title and Exact Value" of Gold, Silver, Lead, Copper, Coal, Iron, Clay or other Mineral Properties IN ANY PART OF THE WORLD. Any information mining men may desire to know, relative to the MINERAL or COAL resources of the entire Pacific Northwest, will be honestly given.
Dr. Willis E. Everette,
1141 R. R. Ave.
Tacoma, State of Washington, U. S. A.

HERBERT LANG,
Mining and Smelting Engineer,
Shasta, Shasta Co., California.

WADE & WADE,
Analytical Chemists and Assayers.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

Patented in the United States and Foreign Countries.

**The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Setf-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.**

**FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.**

**SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.**

**THIRD: The Large Amount of Space Saved.**

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

Send for Catalogue and Price List.

CORRESPONDENCE SOLICITED.

## Coast Industrial Notes.

—Oil prospecting machinery is at work at Point Loma, on San Diego bay.

—T. M. Hale, representing Eastern men, says if San Jose will subscribe $50,000 his company will put up the additional $150,000 required to build an electric road from San Jose to Saratoga.

—The Parke & Lacy Co. recently furnished a 1200-gal. capacity station pump to the Merced G. M. & M. Co. at Coulterville, a complete sawmill outfit to Guatemala, a Gates crusher to Australia and a cableway to the Onena Sugar Co., Honolulu.

On the 31st ult. the Portland, Or., Consolidated Street Railway System was sold under foreclosure for $307,000 to the Rollins Banking Company of Boston. The property comprises three systems, including one extending to Vancouver, Wash.

—At the Atlanta Exposition, on fruit California excelled any other State, and secured the medals and awards, some twenty odd. Most of them will be gold. The State had previously won seventy-five premiums, and it looks as though the total number of awards made to California will aggregate nearly 100, and between forty and fifty of them will be highest in their class and carry with them each a gold medal.

—Despite the plain intent of Congress that one of the two new battle ships should be built on this coast, Secretary of the Navy Herbert has rejected the bid of the Union Iron Works and awarded the contract to the Newport News and Drydock Company. The act authorizing the construction said one of the ships "shall be built on the Pacific coast," but the bid had to be "to the satisfaction" of the Secretary of the Navy, and, of course, it is difficult to satisfy a man who believes that the Allegheny mountains form the western boundary of the United States.

—Moran Brothers of Seattle, Wash., have the contract for building the new Federal tugboat Golden Gate. Their bid was $38,765; the boat is to be completed by August 1st. The boat will be 110 feet long, 100 feet between perpendiculars, 20 feet 6 inches beam, molded, and 12 feet ½ inch amidships. Her propelling power will consist of a triple expansion engine, 13-inch diameter high-pressure cylinder, 21-inch diameter intermediate pressure cylinder and a 32-inch diameter low-pressure cylinder, all of them of 24-inch stroke. The engines will indicate 525-horse power when running at 160 revolutions per minute. The bid is for the vessel without her boiler or fittings; the Government is to furnish the boiler and put it in place. It is to be of the forward water-tube type, similar to the boilers furnished the cruiser Charleston, which type has been approved by the Navy Department.

—A 20-stamp mill is now being erected at the mine of the Golden Gate and Sulphuret Mining and Development Co., Sonora, Tuolumne county, Cal., of the heavy, quick drop type. The mortars are of improved design, with large screen surface. The stamps weigh about 1,000 pounds each, intended to drop from 105 to 110 short drops a minute, with a capacity of 3½ to 4 tons per 24 hours. The stems are 3½ inches diameter by 15 feet long. Cam shafts 6 inches diameter, of hammered iron. Cams, tappets, shoes and dies are made of steel. Each 10-stamp battery is operated by friction clutch pulley. The battery frames are of the "knee" type, built of heavy timbers. The entire plant is operated by water power. The Golden Gate mine has been a rich producer for many years, and when the new 20 stamps are started up, large shipments of bullion are looked for. The mill is being built by the Joshua Hendy Machine Works, and designed by their engineer, John O. Norbom. The same firm recently built a 10-stamp mill for the Golden Gate Manufacturing Company, on the old Tullock mine at Angels, Calaveras county, Cal., and a 10-stamp mill at the Two Channel Gold Mining Company's mine in Placer county.

## Personal.

T. L. Ford expects to start for Washington on the 15th inst.

Nicol Brown is expected to return to London from South Africa next March.

John Moynahan has been appointed superintendent of the Le Roi, Idaho, mine.

D. B. Hanson of the Edw'd. P. Allis Co., has returned from a trip to Milwaukee, Wis.

On the 8th inst. George H. Robinson assumes the management of the Mercur, Utah, property.

Richard Gayou has assumed management of the La Zaragoza mine at Minas Prietas Sonora, Mexico.

Geo. H. Evans has assumed the management of the River Claim, Banner, Butterfly and Rock River mines in Butte Co.

Prof. Jos. Le Conte, of Berkeley, has been elected president of the Geological Society of America, now in session in Philadelphia.

Thos. Couch, manager of the Merced G. M. Co., Mariposa county, is reported seriously ill at the Cullen House, Salt Lake City, Utah.

R. M. Raymond, recently manager Harqua Hala G. M. Co., Arizona, will superintend the workings of the company's newly-purchased properties in Kalgoorlie, Western Australia.

Henry T. Scott, A. Sbarboro, J. Knowles, C. A. Hooper and William Rutherford have been selected as delegates to the national convention of the manufacturers of the United States, to be held at Chicago on the 21st inst.

Prof. Edmund B. Kirby, who has for some years occupied the chair of mining and metallurgy in the State school of mines of Colorado, has resigned that position in order to devote his entire time to his consulting engineering practice in Denver.

**HENDY-NORBOM ORE CONCENTRATOR.**

Office of Orleans Mining Company, Grass Valley, Cal., Dec. 12, 1895.

*Mr. John O. Norbom, San Francisco, Cal.*—Dear Sir: Replying to your inquiry regarding the working of your Concentrator, I take pleasure in stating that the machine is doing excellent work. The curve springs give the machine a very gentle motion, which makes it mechanically perfect. We are saving our sulphurets very clean and lose a trace only in the tailings. The machine takes pulp from five stamps, handling about nine tons per twenty-four hours with ease. Our ore carries from 3½ to 5 per cent of sulphurets. The latest improved belt gives good satisfaction; it has now run about five months. I expect it will last about fifteen, which speaks well for canvas belts. As for little attention and easy working, I can recommend it to any person as being the best machine I have ever used. Wishing you success, I remain, yours truly. [SIGNED] C. A. Brockington, Superintendent.

Office of Federal Loan Mining Company, Nevada City, Cal., Dec. 10, 1895.

*Mr. John O. Norbom, San Francisco, Cal.*—Dear Sir: Your Concentrator, which has been in use in our mill for the last six months, is still doing excellent work. At present we are running the pulp of ten stamps on one machine, without seeming to be overloaded. I can recommend the machine to do all and more than you claimed for it. Yours truly, [SIGNED] J. Vincent, Superintendent.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.

NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.
SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.
THE McGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.
Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.
Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.
You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

# HEALD'S

Business College,

24 Post Street, - San Francisco.

FOR SEVENTY-FIVE DOLLARS

This College instructs in shorthand, typewriting, bookkeeping, telegraphy, penmanship, drawing, all the English branches, and everything pertaining to business, for full six months. We have a large corps of teachers and give individual instruction to all our pupils.

A Department of Electrical Engineering

Has been established under thoroughly qualified instructors. The course is thoroughly practical. Send for Circular. C. S. HALEY, Sec.

The Explorers' and Assayers' Companion.

A Third Edition of Selected Portions of the "Explorers', Miners' and Metallurgists' Companion."

By J. S. PHILLIPS, M. E.

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and discriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Price $6.00 postpaid. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

## The Markets.

SAN FRANCISCO, Jan. 2, 1896.

Two holidays in one week, the end and beginning of that arbitrary division of time called "a year," the general taking of stock, and disinclination to load up, the prevalent uncertainty in and out of Congress—all conspire to make this the dullest of the business season. "Inactive and dull" characterizes the market for metals all over the country.

The *Manufacturer* estimates that the production of pig iron in the United States during 1895 will aggregate 9,387,639 tons—the largest output ever reached either in this country or in Great Britain. The greatest activity before this was reached in 1890, when the production of pig iron amounted to 9,202,703 gross tons, or 184,936 tons less than the estimated output for 1895. In 1892, there was an output of 9,157,000 tons, or 230,639 tons below the expected product of the present year. From 1892 there was a decided decline in the output—7,124,502 tons in 1893 and 6,657,388 tons in 1894. The increase this year is an unprecedented jump of 2,730,251 tons. The nearest approach to it in the United States was the increase from a production of 4,044,526 tons in 1885 to 5,683,329 tons in 1886—an increase of 1,638,803 tons. In Great Britain the largest increase in the output of pig iron in any one year was the advance from 5,995,337 tons in 1879 to 7,749,233 tons in 1880—an increase of 1,753,896 tons.

The superior wealth of this country in raw materials as compared with Great Britain is very encouraging in the slight prospect of a war which, if it comes at all, will, from the nature of the circumstances, be deferred in time to permit us to make full preparation for it. The original English Jingo song was:

We do not want to fight,
But, by Jingo, if we do,
We've got the ships and got the guns,
And men and money, too.

We have what is better—the raw material, the ore from which ships and guns are made, and the patriotic citizens from which the best soldiers are recruited. The lack only is in money, and this results not from dearth of that from which money is made (for we have rich mines of silver as well as of iron, and, further than this, the faith of the people in their Government) but solely from an unpatriotic financial system, based upon a monometallic standard which keeps us at the mercy of foreign bankers.

A declaration of monetary independence of England would be far more sensible and beneficial than a declaration of war over a South American boundary line.

To restore bimetallism, even though it were done by the United States alone, would accomplish all the purposes desired. It would double the prices, in round numbers, of our cotton, our wheat and our silver, our three chief exports; and yet, while it was increasing the quantity of our exportations of the first two commodities, it would very likely tend to decrease the quantity of silver now exported. The very fact that our creditor European customers could no longer buy cheap demonetized silver in America and Mexico to make into rupees and pay out dear for wheat and cotton bought in the silver-using producing nations, which are our competitors for the European markets, would compel the foreign consumers of those commodities to turn to America.

The foreigner buys his wheat and cotton where he can get the best quality at the lowest price. To-day they can buy silver for sixty-six cents and a fraction of an ounce in New York and pay it out for $1.37 8-10 in the form of rupees for Indian wheat and cotton, and naturally they buy the Indian product. Under bimetallism, an ounce of silver would be worth $1.29 and a fraction per ounce in the United States, and with charges, insurance and freight added, the material for the rupees of India would then represent as large, perhaps a slightly larger, figure in the Orient.

## Mining Share Market.

SAN FRANCISCO, Jan. 2, 1896.

The market the past week was interrupted by the midwinter holiday season, and now that having passed there ought to be a more favorable change, yet this is hardly to be expected with lawsuits still in court. Prices strengthened slightly along the entire line, but it does not seem to have the proper staying qualities, the absence of which cause shrewd operators to fight shy. While the market does not give encouragement to dealers to go in on the long side, still it should not cause surprise if little higher figures are reached before another slump sets in. Until conditions are more satisfactory than at present dealers would do well to keep out. Of course the strong tone is made with the view of getting them to buy in expectation that the reports made each year that a deal is to be promoted will prove correct. Experience has, or at least should have taught operators that when moneyed men are in the market the moves are made quite different from those that have been the characterizing feature for a long time past. The reported brokers, assisted by a few outsiders, who are manipulating the market evidently fear to carry prices up much owing to some large operators being ready to throw at them more shares than can be handled to advantage or at a profit. This, no doubt, causes them to be content with a five cent deal. No assessments were levied the past week, but several are pending and will probably come on before January passes. So long as holders are willing to pay assessments just so long will they be levied and collected by the different companies.

The news from the Comstock mines continues favorable, but this condition has been reported so often that it ought to be stereotyped. Several of the weekly letters from superintendents could be done the same way, for they are seldom changed in wording and are fully as unsatisfactory to shareholders as a dry bone is to a hungry person. In the Alta group the work is being slowly but surely pushed. This very slowness causes unpleasant remarks from shareholders. It will yet develop something, if nothing more than an assessment or two. In the Gold Hill group nothing of much importance comes to hand. The work being done in Overman is lost sight of. It ought to be laying the foundation for better work later on. In Seg. Belcher, Belcher, Crown Point and Yellow Jacket the work continues unchanged. There are miners who contend that before six months a strike of ore will be made in one if not two of the mines. At the present rate of progress, it will take some time to get to where ore is expected. Perhaps the companies do not wish to work faster. The work being done in Challenge, Confidence and Con. Imperial is essentially unchanged, but it is stated that something good can be looked for in the spring months. The west crossdrift in Con. Imperial is being pushed slowly, and is far from satisfactory to holders of shares. In Alpha the water still runs; it goes faster than the work which is being run for the west lode. The long west drift in Bullion is still being pushed ahead. In Potosi, Chollar, Hale & Norcross and Savage the work is essentially unchanged. Ore is still being raised; it is extracted from the small streaks found in prosecuting the work, some of the ore being high grade, that taken from Hale & Norcross running the highest. In Best & Belcher and Gould & Curry the work is not calculated to enthuse any one. Considerable work is being done on several levels in Con. Virginia. Ore is raised, but not in sufficient quantities to prove beneficial or of interest. It may help to get shareholders to pay assessments. Better results ought to be had in this mine before three months pass. In Ophir and Mexican there is nothing new to report. The work is being done on an upper and lower level and is closely watched by old miners. In Sierra Nevada and Union the advices are rather encouraging, but nothing of a definite character is at hand. It will take several weeks before results can be determined.

From the Brunswick lode there is nothing new reported. The work that is being prosecuted by the several mines having ground on the lode is said to be attracting more attention. The work is being pushed with a considerable degree of energy, yet it may take many weeks before the expected ore is struck. In Occidental the work is closely watched, as this mine is considered the key to the situation on that lode.

From the Bodie district nothing new is at hand. There are operators, and miners too, who have great confidence in this district. They express themselves as confident that a strike of paying ore will be made by next spring.

The following illustrates the changes of the week:

| MINES. | Dec. 26. | Jan. 2. |
|---|---|---|
| Alpha | $ 23 | $ 25 |
| Alta Consolidated | ..... | 19 |
| Andes | ..... | 21 |
| Belcher | 29 | 31 |
| Best & Belcher | 35 | 38 |
| Bullion | 47 | 43 |
| Challenge | 19 | ..... |
| Chollar | ..... | 30 |
| Confidence | 58 | 72 |
| Consolidated California and Virginia | 1 15 | ..... |
| Consolidated New York | 2 35 | 2 45 |
| Crown Point | ..... | ..... |
| Exchequer | ..... | 10 |
| Gould & Curry | 44 | 48 |
| Hale & Norcross | 98 | 1 08 |
| Justice | ..... | 05 |
| Mexican | 64 | 65 |
| Ophir | 1 40 | 1 45 |
| Overman | 10 | 21 |
| Potosi | 56 | 62 |

# Assessment Notices.

WEST SIDE CANAL AND LAND COMPANY.—Location of principal place of business, San Francisco, California. Location of Works, Fresno and Kings counties, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 30th day of December, 1895, an assessment (No. 3) of one (1c) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 8, Floor 8, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of February, 1896, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 27th day of February, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS E. NAYLOR, Secretary.

Office, Room 8, Floor 8, Mills Building, San Francisco, California.

ANCHOR COAL AND DEVELOPMENT COMPANY.—Location of principal place of business, San Francisco, California. Location of Works, Kelso, Cowlitz county, Washing on.

Notice is hereby given, that at a meeting of the Board of Directors held on the second (2d) day of January, 1896, an assessment (No. 6) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 632 Market street, Room 5, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the third (3d) day of February, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the fifth (5th) day of March, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. D. FARISH, Secretary.

Office, No. 632 Market street, Room 5, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of December, 1895, an assessment (No. 21), of fifteen (15) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of January, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of February, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

HITE GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the seventeenth day of December, 1895, an assessment (No. 2) of 10c (ten cents) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, Room 27, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of January, 1896, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 10th day of February, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. E. MATHEWS, Secretary.

Office—Room 27, 120 Sutter street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from Joe G. De Bous in the Kerr mine, near Yankee Jims, Placer county, to impound tailings in Devil's canyon; from L. M. Sherwood et al, in the Sherwood & Snyder mine, near Chinese Camp, Tuolumne county, to impound tailings in Moccasin creek; from Henry A. Halsted in the Clay Bank mine, near Meadow Valley, Plumas county, to impound tailings in a ravine; from W. H. Glenn & J. H. Hayden in the Blue Gravel mine, near Rancheria, Amador county, to impound tailings in Rancheria creek; from J. F. Evans in the Emma Harding mine, in Cook's canyon Plumas county, to impound tailings in a swamp; from John Smith in the Roman mine, Mountain Meadows, Lassen county, to impound tailings in a swamp; and from Wiley Sexton in the Kendall mine, near Grizzly Flat, El Dorado county, Cal., to impound tailings in Dogtown creek, gives notice that a meeting will be held at room 92, Flood building, San Francisco, Cal., January 13th, 1896, at 1:30 P. M.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from John Spaulding in the Polar Star mine near Dutch Flat, Placer Co., and T. G. Phelps in the Liberty Hill mine, Nevada Co., to impound tailings in Bear River, and from Olonzo Engle in the Adkins mine near Ono, Shasta Co., to impound tailings in a ravine, gives notice that a meeting will be held at room 92, Flood Building, San Francisco, Cal., on Jan. 20th, 1896, at 1:30 P. M.

AMERICAN AND FOREIGN PATENTS
CAVEATS, TRADE MARKS,
DEWEY & CO.
220 MARKET ST. S.F.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR THE WEEK ENDING DECEMBER 24, 1895

551,942.—SIGNAL LATCH—Barnes & Slater, Oakland, Cal.

551,989.—PILEDRIVER HAMMER—J. Munro, Astoria, Or.

551,833.—VAPOR BURNER—E. J. Nichols, S. F.

551,994.—BRUSHES—K. S. O'Keeffe, S. F.

551,909.—CAN SPOUT—J. O. Sprague, Sacramento, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order. American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CAN SPOUTS. James O. Sprague, Sacramento, Cal. No. 551,909. Dated Dec. 24, 1895. This invention relates to a spout or nozzle for oil or other cans by which the contents can be easily poured by tilting the can, and the receptacle prevented from overflowing when filled to the proper depth. The device also prevents waste by dripping. It consists of a single tube straight for the greater portion of its length, having the outer end curved, a partition fixed centrally in the tube on edge extending from the inner end to the outer extremity of the curved end so as to form independent passages conforming to the curvature of the tube, and one side of the tube is cut away so that the two passages are of different lengths. This allows the liquid to flow out through one passage, while the air enters through the other to take its place. The curvature of the outer end of the vessel is such that the can must be tilted back far enough to prevent the flow of liquid before it can be raised up from the receiver, thus preventing the waste by dripping.

ELECTRIC LATCH APPARATUS FOR SEMI-AUTOMATIC OPERATION OF RAILROAD SIGNALS.—H. C. Barnes and W. W. Slater, Oakland, Cal. No. 559,142. Dated Dec. 24, 1895. This invention relates to a latch apparatus for the semi-operation of railway signals. It consists of the combination with a movable signal or semaphore, of a mechanism independent of the signal device for controlling the same, comprising a centrally pivoted latch lever to the outer end of which a connection from the signal is detachably connected so that the signal is normally held in safety position and allowed to move to the danger position when the connection with the lever is broken. In conjunction with this is a depending stop pivotally held at its opposite end, and adapted to engage and hold the inner end of the latch lever, an electro-magnet and intermediate mechanism controlling the free end of the stop and an air-cushion mechanism whereby the movement of the signal, when released, is regulated.

STATION INDICATOR.—Chas. E. Larrabee, of Berkeley, Cal. No. 551,502. Dated Dec. 17, 1895. This indicator belongs to the class of devices used in railway and street cars for automatically exhibiting the name of the station or street to which the car is approaching. It is one of that kind of indicators in which the names are shown by means of connections deriving their motion from contact with a fixed lug or projection in the roadway. The improvement consists chiefly in the power transmitting connections which are so arranged as to obviate the use of springs and to provide for a nicely regulated and accurate contact whereby the operation of the indicator is positive.

DEPARTMENT OF THE REGISTRAR OF PATENTS, South African Republic.—Application for improvements in traction engines—Registered No. 1004 (official Dutch title verbeteringen aangebracht in locomobielen).

Notice is hereby given for general information that Daniel Best, residing at California, America, deposited on the 20th day of October, 1895, at my office, an application for letters patent for the invention above named, with specification relating thereto.

Now, whereas the said D. Best has given me written notice that he wishes to proceed with his application, I have decided that all objections thereto shall be filed at my office before Friday, the 14th day of February, 1896, at 3 o'clock P. M., after which time the Attorney-General will fix the date of hearing.

I therefore summon all persons interested in objecting to a patent being granted for the above named invention to the above mentioned D. Best to deposit with me a document clearly setting forth their objections before the aforesaid date, as they will otherwise be excluded from submitting the same.

Done this 29th day of October, A. D. 1895, at Pretoria, South African Republic.

(Signed) CARL VECKERMANN, SR.
Registrar of Patents.

## DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Middle Fork Feather River, Plumas county, near La Porte.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 5th day of November, 1895, the several amounts set opposite the names of the respective shareholders, as follows:

| Names. | No. Cert. | No. Shares. | Amt. |
|---|---|---|---|
| L. M. Hoefler | 24 | 2,500 | $75 00 |
| L. M. Hoefler | 25 | 2,500 | 75 00 |
| L. M. Hoefler | 88 | 1,000 | 30 00 |
| L. M. Hoefler | 89 | 1,000 | 30 00 |
| L. M. Hoefler | 90 | 500 | 15 00 |
| L. M. Hoefler | 91 | 100 | 3 00 |
| L. M. Hoefler | 92 | 100 | 3 00 |
| L. M. Hoefler | 93 | 100 | 3 00 |
| L. M. Hoefler | 94 | 100 | 3 00 |
| L. M. Hoefler | 95 | 100 | 3 00 |
| L. M. Hoefler | 96 | 500 | 15 00 |
| L. M. Hoefler | 97 | 500 | 15 00 |
| L. M. Hoefler | 98 | 500 | 15 00 |
| L. M. Hoefler | 99 | 500 | 15 00 |
| Raymond Parry | 15 | 625 | 18 75 |

And in accordance with law, and an order from the Board of Directors, made on the 5th day of November, 1895, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 37 and 38 Crocker Building, San Francisco, California, on THURSDAY, the 16th day of January, 1896, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

E. C. GODFREY, Secretary.

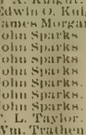
Office, 37 and 38 Crocker Building, San Francisco, California.

**FOR SALE.**

**A THIRTY-STAMP MILL AND A STEAM HOIST** Capable of sinking 1000 feet. Located at Drytown, Amador Co. W. S. WEYMOUTH, 19 Stevenson St., San Francisco.

## DELINQUENT SALE NOTICE.

JAMISON MINING COMPANY. LOCATION OF principal place of business San Francisco, California. Location of works, on Jamison creek, near Johnsville, Plumas County, California.



Notice. There are delinquent upon the following described stock, on account of assessment (No. 5) levied on the 29th day of November, 1895, the several amounts set opposite the names of the respective shareholders as follows:

| Name. | No. Cert. | No. Shares. | Amt. |
|---|---|---|---|
| George Hackett | 135 | 250 | 5 00 |
| J. C. Kluckrem | 141 | 70 | 1 40 |
| B. A. Knight | 142 | 500 | 10 00 |
| Edwin O. Knight | 144 | 500 | 10 00 |
| James Morgan | 130 | 150 | 3 00 |
| John Sparks | 164 | 1000 | 20 00 |
| John Sparks | 165 | 1000 | 20 00 |
| John Sparks | 166 | 2000 | 40 00 |
| John Sparks | 167 | 1000 | 20 00 |
| John Sparks | 168 | 1000 | 20 00 |
| John Sparks | 169 | 500 | 10 00 |
| John Sparks | 216 | 500 | 10 00 |
| C. L. Taylor | 123 | 500 | 10 00 |
| Wm. Trathen | 139 | 500 | 10 00 |
| Chas. Troon | 124 | 500 | 10 00 |

And in accordance with law, and an order from the Board of Directors, made on the 16th day of December, 1895, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, rooms 50 and 54, 120 Sutter St., San Francisco, California, on MONDAY, the 6th day of January, 1896, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

SAM. W. CHEYNEY, Secretary.

Office, Rooms 50 and 54, 120 Sutter St., San Francisco, California.

**VAN DUZEN STEAM JET PUMPS**

*THE BEST IN THE WORLD.*

Pumps any kind of Liquid. Always in order. Never clogs nor freezes. Fully Guaranteed. COST $7 AND UPWARD. Especially useful for Mines, Quarries, Pits, Wells, Clay Pits, Breweries, on Steamships, Ferryboats or any place where steam is available and liquid to be pumped. A full supply in stock. Address,

# BOOKS ON WORKING ORES.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL, M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

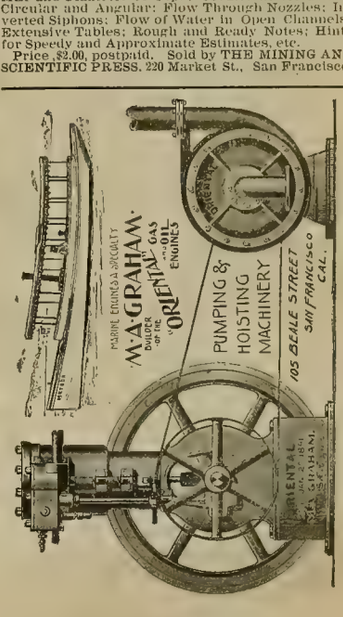
BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 184 pages, octavo, illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco

# PRACTICAL HYDRAULICS.

**A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators.**

BY P. M. RANDALL.

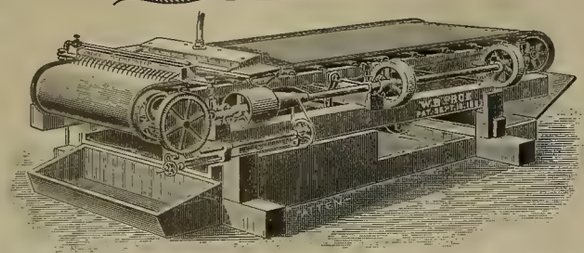


This work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

TABLE OF CONTENTS.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan: Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water Through Openings; Weir Coefficients; Triangular Weirs; Flow of Water over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels. Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.



Price $2.00, postpaid. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

# FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.

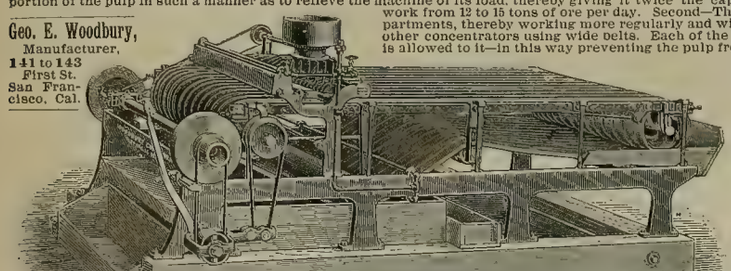
# RISDON IRON WORKS.

Office and Works: Cor. Beale and Howard Sts., San Francisco.

Cable Address: "RISDON'S" San Francisco.



MANUFACTURERS OF

Johnston's Concentrator, Improved Bryan Mills,
Risdon Ore Feeders "Challenge Type," Air Compressors,
KNIGHT WATER WHEELS—Highest Efficiency Guaranteed.

MINING, MILLING, PUMPING and HOISTING PLANTS.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891, MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. Price $575 f. o. b. Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect; Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury,
Manufacturer,
141 to 143
First St.
San Francisco, Cal.

PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1895.

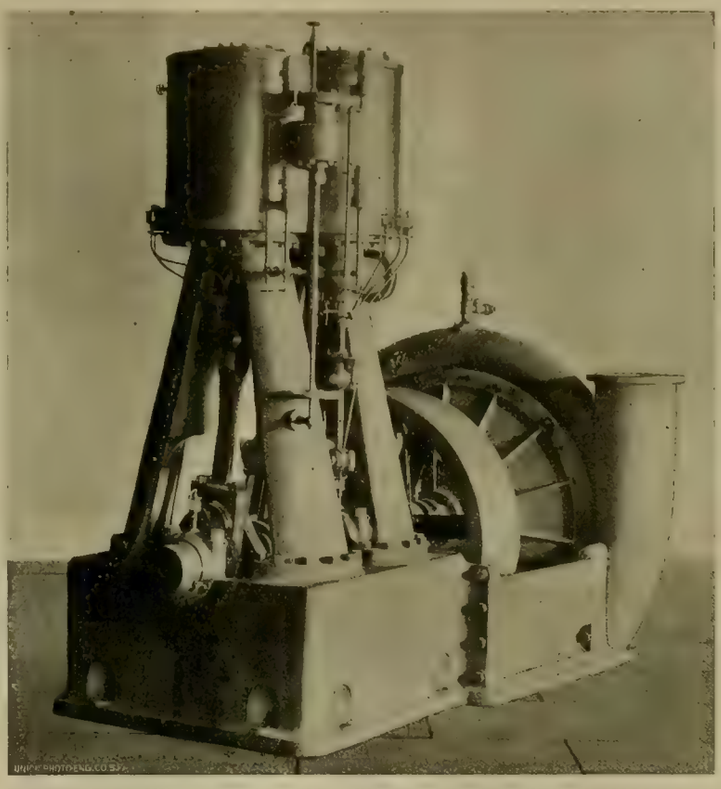
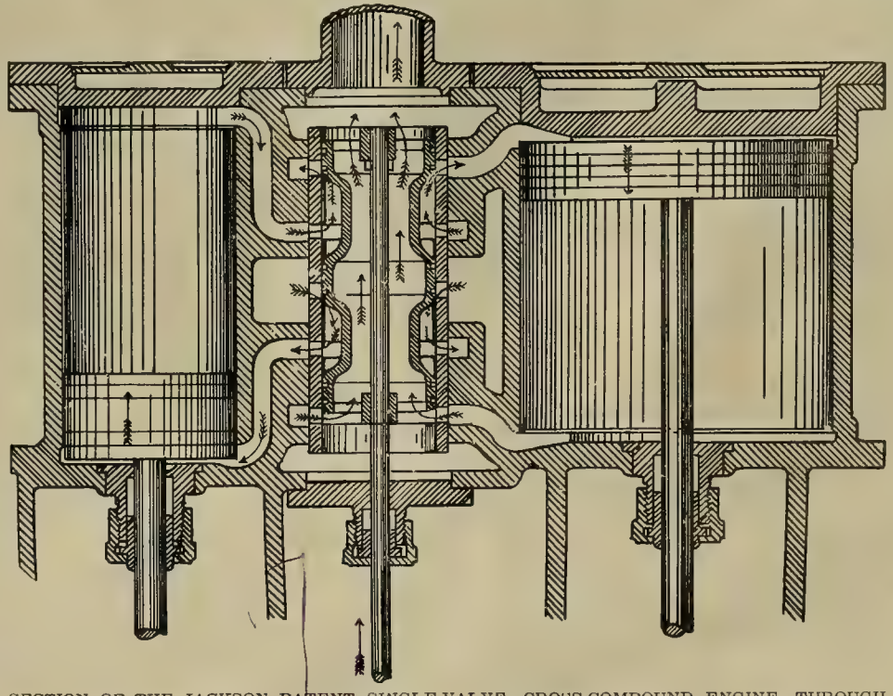
AND PACIFIC ELECTRICAL REVIEW.



VOLUME LXXII. Number 2.

SAN FRANCISCO, SATURDAY, JANUARY 11, 1896.



THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

## Single-Valve, Cross-Compound Engine.

Herewith is illustrated a single-valve, cross-compound engine, made by Byron Jackson for the Edison Light and Power Co. of this city. It is 175 H. P., 6000-gallon centrifugal pump, for 70-foot head. It pumps all the water for condensing from San Francisco bay to the three power stations of the company, aggregating nearly 10,000 H. P. The engine and pump are guaranteed to run thirty days and nights continuously "without showing any signs of distress," the pump to give 60 per cent efficiency, and the engine to not consume more than fourteen pounds of water per indicated horse power per hour. The engine is so made that it can be changed from condensing to non-condensing, though it is deemed advisable to go to the expense of adding a condenser. The main between this engine and other compound engines is in the absence of any kind of extra pipes or passageways or receivers between the two cylinders. In other double-cylinder engines there must be some extra pipe or passageway of some kind, through which the steam must travel from one end of the small cylinder to the opposite of the large cylinder; and when the communication is open at the end of the stroke, the steam, passing from the small cylinder, has to expand and fill the passageway, or receiver, before it enters the large cylinder; and if this passageway, or receiver, be large the steam must necessarily suffer a reduction of pressure, which must cause serious reduction of pressure in the large cylinder. This loss of pressure may be so great as to almost neutralize the gain by expansion. In the engine under discussion there is no extra receiver or extra pipe or passageway, as will be seen by reference to the sectional view, which shows in sections the two cylinders, the single valve located underneath and between the two cylinders, and all of the steam ports. The arrows indicate the direction the steam is traveling, showing the course the live steam takes as it enters the small cylinder, and its route from the small cylinder back through the port and valve chamber into the low pressure cylinder, and from thence into the valve chamber, and through the center of the valve to the exhaust at the end of the valve chamber. This exhaust may be piped away from either end of the valve chest, as is most convenient, but is usually in practice connected at the front end under the engine, which leaves the back end of the engine clean and readily accessible to the valve and pistons without removing any pipe. The valve, being located below, drains all condensed water from the cylinders. Three sets of cards taken while the engine was running at a uniform speed of 200 revolutions per minute on the governor, the boiler pressure being raised from 47 to 80 lbs., illustrate how the compression changes with the cut-off and boiler pressure always nearly reaching the initial steam line, thus filling the clearance space with the steam trapped in.

JACKSON'S SINGLE-VALVE, CROSS-COMPOUND ENGINE, 175 H. P., 6000-GALLON CENTRIFUGAL PUMP, FOR 70-FOOT HEAD.

SECTION OF THE JACKSON PATENT SINGLE-VALVE, CROSS-COMPOUND ENGINE, THROUGH BOTH HIGH AND LOW PRESSURE CYLINDERS, TO CENTER OF VALVE.

---

Assistant Secretary Hamlin, in a letter to the Collector of Customs at El Paso, Texas, makes the following ruling: "The department duly received your letter of the 28th of September last, submitting an application from the Consolidated Kansas City Smelting and Refining Co., for permission to import and enter under the same entry a mixture of silver-lead ores from different mines. From a report dated October 17th last, of Special Agent G. W. Whitehead, it appears that said company owns in the mining camp of Sierra Mojada, Mexico, three groups of mines—the San Salvador, the Volcan Dolores and the San Jose Jesus Maria; that the Volcan Dolores mine has changed recently so that the ore taken therefrom contains very little silver, and if imported separately would be classified under paragraph 165 of the tariff as lead ore, dutiable at the rate of ¾ cent per pound of its gross weight and not, as heretofore, on the weight of the lead contained therein; but that a mixture of this ore with the products of the other mines, which are richer in silver, would be classified as silver-lead ore, subject to duty on the lead contents only. As the mixture of ores from different mines for the purpose mentioned would be contrary to the requirement of paragraph 2 of the department's special regulations of July 17, 1889, (S. 9492) viz., that the entry of any ore from Mexico shall contain a declaration that "the importation embraces no mixture of ores or concentrates from different mines;" and as, in the opinion of the department, said requirement is indispensable to the proper classification of ores under the provisions of paragraph 165 of the act of August 28, 1894, a strict compliance with said regulations must be insisted upon in order to protect the interests of the revenue and therefore the application is denied."

# MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

*Office, No. 220 Market Street, Northeast Corner Front, San Francisco.*
*Take the Elevator, No. 12 Front Street.*

ANNUAL SUBSCRIPTION:

San Francisco, January 11, 1896.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Jackson's Single-Valve, Cross-Compound Engine, 175 H. P., 6000-Gallon Centrifugal Pump for 70-Foot Head; Section of the Jackson Patent Single-Valve, Cross-Compound Engine, Through Both High and Low Pressure Cylinders; to Center of Valve, 21.

EDITORIAL.—Single-Valve, Cross-Compound Engine; A New Ruling, 21. The New Gold Mining Exchange; Colorado and California's Gold Output for 1895; Improvement on Unpatented Mining Claims Claimed To Be Unconstitutional; New Members of the Debris Commission; Appropriation for Maintenance of U. S. Debris Commission; National Jurisdiction in Land Office Cases; Three Proposed Bills, 22.

SCIENTIFIC PROGRESS.—Difficult Engineering Feat; E'ectricity Direct from Coal; Coalless Cities, 27.

MECHANICAL PROGRESS.—The Life of the Present Steel Rail; To Bore Glass; Machine vs. Intelligence; Aluminum Solder; Edison's Experiments; The Electric Stevedore, 27.

ELECTRICAL PROGRESS.—Why the Arc Light Hisses; New Electrical Fields; Suit by the Safety Insulated Wire and Cable Company of New York; Street Cars Still Expensive; First Electric Light in an American Theater; Glucinum; To Measure and Record the Time Over a Telephone Wire; Calcium Carbide; An Alternating Current Dynamo; Used by Medical Experts; A New Electric System; To Generate and Transmit Electric Power; The First of the Great Electric Switch Engines, 28.

PRACTICAL INFORMATION.—Burnt Steel—An Application of a Theory, 28. When Will the Twentieth Century Begin? Aluminum for Obtaining a Flashlight, 29.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 30–31–32.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 38.

MISCELLANEOUS.—Concentrates, 23. Notes on Gold Mining in California, 24. Ore Treatment—Cyanide and Chorination; Novel Use of a Glass Eye, 25. Mines and Mining in Nevada County; Balance Sheet of a South African Mine; Cedar River Gravity Water Supply for the City of Seattle, Washington, 26. Recent Decisions; Colorado Miners' Wages; Gold and Silver Product of the United States in 1895, 29. New Mining Companies Organized This Week, 32. Coast Industrial Notes; Personal, 34. Notices of Recent Patents, 39.

THE new Gold Mining Exchange has organized for business, the San Francisco Stock Exchange has announced its willingness to list the stock of gold mining companies, and the additional opportunity will probably be embraced in any case where the inducements seem to be sufficient.

CIRCULARS and statements are received from Colorado to the effect that the gold yield of that State for '95 is $17,000,000, and that "Colorado's annual gold yield at last exceeds California's." As will be seen elsewhere, the Director of the Mint does not share that opinion, he, in his estimates, giving Colorado $15,000,000 and California $15,600,000. Competition and rivalry, except of a friendly nature, need not enter into the matter, and it is probable that when the exact facts are obtainable, or a more correct approximation is secured, it will be found that this State led in '95 as in all other years in the amount of gold produced.

ACCORDING to a long dispatch from Helena, Montana, an astute attorney of that place has discovered that the law requiring the annual expenditure of $100 in work or improvement on unpatented mining claims is unconstitutional. The dispatch concludes as follows: "This prominent attorney stands ready to dispute the claims of those he advised not to do the statutory development work, and says he will fight the matter through every court in the land until the Supreme Court of the United States in Washington is reached. He has made long and careful search in this particular case, and evidently knows what he is talking about, although he refuses to make known the grounds for his assertion." The result will be that long before he gets to the Supreme Court his unfortunate clients will regret having put any trust in such assumption, which only needs notice to be contemned and does not deserve serious comment.

CALIFORNIA'S HYDRAULIC MINERS are greatly interested in the new members of the Debris Commission. The outgoing members have creditably filled a most difficult task. With no increase in salary, they took up a new work in addition to their other duties and so conducted the U. S. Debris Commission as to compel the respect and acquiescence of valley residents who were opposed to the idea of any resumption of hydraulic mining. They have treated all sides and interests with absolute fairness, have given every detail of their duties active personal attention, and, though at times apparently rigid in their enforcement of the law, at no time have they made any requirement to which any miner desiring to exactly comply with the law could reasonably object. The high character of the U. S. Engineer Corps justifies the belief that the gentlemen who succeed to the recently vacated places will be found equally acceptable to all parties, though it may be said with no invidious comparison that the long residence in this State of the former members of the Commission, and their intimate acquaintance with the subject, made their work of great value.

SOME TIME ago the fact was cited herein that the appropriation made for the maintenance of the U. S. Debris Commission of this city was running short. The California Legislature promptly memorialized Congress asking for necessary funds for its continuance, but the movement was checked by Gen. Casey the then chief of the U. S. Engineer Corps. It is to be briefly stated that only one appropriation was ever made for the maintenance of that Commission, and that was a paltry one of $15,000 in the act that created that body, that by the most rigid economy the board has so far been enabled to maintain official existence, that the work is of the greatest importance to the hydraulic mining interests of the State, and that there is hardly enough now on hand to last till March 1st. of this year. The matter is of immediate importance and is commended to the attention of the Executive Committee of the California State Miners' Association at its special meeting next Tuesday evening.

IT is now proposed to segregate national jurisdiction in land office cases, and thus facilitate determination of that class of questions in the Department of the Interior by transferring the authority now vested in the Secretary of the Interior and the Commissioner of the General Land Office to three boards of three members each, appointed by the Secretary of the Interior, one board to pass upon mineral land contests, another upon agricultural land contests and the third to have charge of cases not included in the first and second classifications. The plan embraces a "Public Land Board of Appeals," consisting of five members appointed by the Secretary of the Interior, whose decisions shall be final. Nothing further in the way of legislation can be more adverse to the miner than recent rulings and decisions in that department, and any change in the manner of administering "justice" need not be negatived. Senator Baker, of Kansas, has introduced the bill outlined above.

## Three Proposed Bills.

The proposed "compromise" mineral land bill has heretofore received considerable discussion in these columns. The objections to it being unanswered because unanswerable, their repetition is unnecessary. In addition to that measure, three others have been prepared by the Legislative Committee of the California State Miners' Association, which are admirable in tone and intent, and deserve the hearty support of every one in the State in any way connected with the mining interests. They have all been presented by Senator Perkins in the Senate and Representative Johnson in the House. Their full text is as follows:

A BILL TO AMEND CHAPTER SIX, OF TITLE THIRTY-TWO, OF THE REVISED STATUTES, RELATING TO MINERAL LANDS AND MINING RESOURCES.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled:*

SECTION 1. That section twenty-three hundred and twenty-four of the Revised Statutes be amended so that the same shall read as follows:

"SEC. 2324. Miners of each mining district may make regulations not in conflict with the laws of the United States, or with the laws of the State or Territory in which it is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground so that its boundaries can be readily traced, such marking to include one post or monument at each corner of the claim. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location, and such description of the claim or claims located by reference to some natural object or permanent monument as will identify the claim. On each claim located, and until payment of the purchase money and a certificate of entry has been issued therefor, not less than $100 worth of labor shall be performed or improvements made during each year.

"Where such claims are held in common, such expenditures may be made upon any one claim by any work or improvements tending to develop any of such claims. The period within which the work required to be done annually on mineral claims is to be performed shall commence at 12 o'clock meridian on the first day of January succeeding the day of location of such claim.

"When the labor required by this Act shall have been performed, or the improvements made, an affidavit may be filed within thirty days after the time limited for the performance of such labor, or making of such improvements, with the Recorder of Deeds in the county in which the claim or mine is situated, particularly describing the labor performed, and the improvements made, and the value thereof, which affidavit shall be *prima facie* evidence of the facts therein stated; and upon a failure to comply with the conditions of this Act, in the performance of labor or the making of improvements, the claim or mine upon which such failure occurred shall be open to relocation in the same manner as if no location had ever been made; provided, that the original locators, their heirs, assigns or legal representatives, do not resume work upon the claim after such failure, and before such relocation, and continue the same with reasonable diligence until the required amount of labor shall have been performed or improvements made. Upon the failure of any one of several co-owners to contribute his proportion of the expenditure required hereby, the co-owners who have performed the labor or made the improvements may, at the expiration of the year, give such delinquent co-owner personal notice in writing, or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days, and if at the expiration of ninety days after such notice in writing, or by publication, such delinquent shall fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners who have made the required expenditure. A copy of such notice, together with an affidavit showing personal service or publication, as the case may be, of such notice, when filed and recorded with the Recorder of Deeds in the county in which such mining claim is situated, shall be *prima facie* evidence of the acquisition of title of such co-owners. Where a person or company has run or may run a tunnel, or constructed roads or trails, for the purpose of developing a claim or claims owned by said person or company, the money so expended in running said tunnel or constructing said roads or trails shall be taken and considered as expended on said claim or claims; provided, further, that said claim or claims shall be distinctly marked on the surface, as provided in this Act."

SEC. 2. That section twenty-three hundred and twenty-four of the Revised Statutes be amended by adding thereto the following:

"And the surveyors appointed under the provisions of this section shall have power to administer oaths to their assistants."

SEC. 3. That section twenty-three hundred and thirty-five of the Revised Statutes be amended so as to read as follows:

"SEC. 2335. All affidavits required to be made under this chapter may be verified before any officer authorized to administer oaths in the State or Territory where the claims may be situated, having an official seal, and all testimony and proofs may be taken before any such officer, and when duly certified by the officer taking the same, attested by his seal of office, shall have the same force and effect as if taken before the Register and Receiver of the Land Office. Whenever any contest shall arise as to the mineral character of any land claimed to be subject to entry or sale under an Act of Congress, all proceedings shall be stayed until the controversy shall have been settled or determined by a court of competent jurisdiction in the county where such land is situated, or the contest withdrawn; and it shall be the duty of the Register of the Land Office in which such contest is made to immediately certify such contest to such court, and to immediately notify the contestant and contestee thereof.

Within thirty days after filing such contest, the contestant shall file in such court a verified statement of the facts upon which he bases his contest, in plain and concise language, and shall serve the same upon the contestee; and thereafter, and within the time provided by the laws of the State or Territory where such land is situated, for answering in any civil action, the contestee shall file his verified answer to such statement, and thereupon the contest shall be tried and determined as are ordinary actions in such court; and, when determined, such determination shall be certified to the Register, and such determination shall be binding upon him, and shall be forever conclusive as to the character of the land in question; provided, that the presence of rock, earth or gravel, bearing gold, silver, cinnabar, petroleum or other valuable mineral, shall be regarded as *prima facie* evidence that the land containing the same is mineral in character; and provided, further, that in investigating the character of land with a view to ascertaining whether it is more valuable for mineral than for agricultural purposes, evidence may be taken of the mineral discovered or developed adjacent to such land, proof of which shall be taken as presumptive evidence that the land in question is mineral in character; and provided, further, that wherever land is proven to be within a well-defined mineral belt, such land shall be deemed, presumed and taken to be mineral land, unless the contrary is proven; and provided, further, that the provisions of this chapter shall be liberally construed, with a view to aid the applicant in procuring title to the mineral lands of the United States, and that the rules and regulations prescribed by the Land Department for its government and that of its officers, in disposing of said lands, shall be so formulated and administered as to assist the Government in disposing of said lands to *bona fide* applicants; and provided, further, that all applicants for patent for lands, upon which exists a valid mining location, the notice of location of which, designating the section and township in which such location is situated, shall have been recorded in the office of the Recorder of Deeds of the county wherein the land in question is situated, must, except when otherwise in this act provided, give to such mineral claimant notice of such application in writing, or by publication in the newspaper published nearest such mining location, at least once a week for sixty days."

SEC. 4. That Section twenty-three hundred and thirty-seven of the Revised Statutes be amended so as to read:

"SEC. 2337. Where non-mineral land not included in a lode claim is used or occupied, or is intended to be used or occupied, by the proprietor of such vein or lode claim for mining or mineral purposes, such non-mineral surface ground may be embraced and included in an application for a patent for such vein or lode claim, and the same may be patented therewith or separately, subject to the same preliminary requirements as to survey and notice as are applicable to vein or lode claims; but no location hereafter made of such non-mineral land shall exceed ten acres, and payment for the same must be made at the same rate as fixed by this chapter for the superfices of the lode claim. The owner of a quartz mill or reduction

works, not owning a mine in connection therewith, may also receive a patent for his mill site as provided in this chapter."

A BILL TO APPROPRIATE MONEY FOR THE CONSTRUCTION OF WORKS TO IMPOUND MINING DEBRIS, AND THEREBY TO PROTECT THE NAVIGABLE STREAMS OF CALIFORNIA.

*Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled:*

SECTION 1. That there is hereby appropriated out of any money in the treasury not otherwise appropriated the sum of one million and thirty thousand dollars, which sum shall be immediately available and shall be expended under the direction of the Secretary of War, in accordance with the plans, specifications and recommendations of the California Debris Commission, appointed under the Act of Congress entitled, "An Act to create the California Debris Commission and regulate hydraulic mining in the State of California," approved March 1, 1893, for the purpose of constructing works for the restraining and impounding of mining debris upon the tributaries of the Sacramento and San Joaquin rivers in California and the branches of such tributaries.

SEC. 2. Whenever any such works for the restraining and impounding of mining debris shall have been constructed out of such appropriation, or shall have reached such a stage as, in the opinion of such commission, it shall be safe to use the same, it shall be lawful for such commission to make the order provided for in section 13 of said act, upon proceedings being first had and taken in accordance with the provisions of sections 9, 11 and 12 of said act, but in such cases the owners of the mines affected by said orders shall not be bound by the proviso to said section 13 of said act nor by the provisions contained in section 16 thereof.

SEC. 3. The said commission shall also have the power to make the order provided for in section 13 of said act as to any mine or mines whenever it shall appear to the satisfaction of said commission that no impounding works are necessary other than the means already provided by nature to protect from material injury the navigable streams mentioned in said act and the land adjacent thereto, upon proceedings had in accordance with sections 9, 10 and 12 of said act.

A BILL TO AMEND AN ACT ENTITLED "AN ACT TO CREATE THE CALIFORNIA DEBRIS COMMISSION AND REGULATE HYDRAULIC MINING IN THE STATE OF CALIFORNIA," APPROVED MARCH 1ST, 1893, BY AMENDING SECTION TWENTY-TWO THEREOF.

*Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled:*

SECTION 1. That section twenty-two of an act entitled "An act to create the California Debris Commission and regulate hydraulic mining in the State of California," approved March 1st, 1893, be amended so as to read as follows:

"SEC. 22. Any person or persons who willfully or maliciously injure, damage or destroy, or attempt to injure, damage or destroy, any dam or other works erected under the provisions of this act for restraining, impounding or settling purposes, or for use in connection therewith, shall be guilty of a misdemeanor, and on conviction thereof shall be fined not to exceed the sum of $500 or be imprisoned not to exceed five years, or by both such fine and imprisonment, in the discretion of the Court; and any person or persons, company or corporation, their agents or employes, who shall mine by the hydraulic process, directly or indirectly injuring the navigable waters of the United States in violation of the provisions of this act, shall be guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine not exceeding $500."

## Concentrates.

DURING December the Comstock paid out $68,272.41.

PIERCE CITY, IDAHO, placer miners are happy over three feet of snow.

A STATE GEOLOGIST is represented to be one of Montana's present needs.

INTERIOR papers chronicle columns of filing of affidavits of assessment work performed.

THE Boise, Idaho, Mining Exchange has a membership of 225. The membership fee is $20.

VENEZUELA, which has such present prominence, yields about $1,000,000 in gold annually.

THE Gold Drop and Monarch claims, Greenwood, Boundary creek, are sold to Montreal men for $20,000 each.

ARCHULETA CO., NEW MEXICO, reports extensive petroleum deposits, which are receiving considerable present attention.

IN distinction to the usual term "output" in speaking of the gold yield, the lumber journals now refer to the "input" of logs.

IN the territory adjacent to Deadwood, South Dakota, there are 1703 mines at work. Last year at this time the total was 1280.

DURING '95 one hundred and twenty-six mining companies incorporated in Colorado, mostly in Cripple Creek, the aggregate capital stock being $461,061,500.

A BAKER CITY, OR., mining man says "forty or fifty new mills will be built" in that vicinity this year. If so, that will be an interesting locality for makers of mining machinery.

THIS week the San Francisco and Alameda county supervisors memorialized Congress in favor of the four mining bills recently introduced by Senator Perkins and Congressman Johnson.

A CONTRACT has been let to run the Strickler tunnel near Colorado City, one and one-half miles in length, through Pike's Peak at an altitude of 11,580 feet, through solid granite.

LAST Tuesday President Cleveland sent to the Senate the names of Colonel Charles R. Suter, Major C. E. L. B. Davis, Captain C. E. Gillette, corps of engineers, as members of the California Debris Commission.

W. S. STRATTON, the Cripple Creek millionaire, proposes an organization of gold producers to hold or sell their product at the highest market price and make the $10,000,000 expected by Morgan et al. on the bond deal.

UP in Plumas and Sierra counties in deep snow the stage horses wear snow shoes. Any one curious to see what kind of a snow shoe a horse wears can see one at the State Mining Bureau on Fourth street, this city.

SENATOR PRITCHARD of North Carolina has introduced an amendment to the tariff bill restoring the McKinley duty on clays, marble, lime, stone and iron ore, and increasing the duty on mica to fifty cents per pound.

E. A. STENT of Sonora, Tuolumne Co., one of the projectors of the proposed railroad from Stockton to Sonora, says articles of incorporation will soon be filed and work begun. A smelter at Stockton is part of the scheme.

VICTOR, COLORADO, dispatches say that valuable mining claims thereabouts have been jumped "because assessment work thereon was not done in '93." That is a poor plea. No assessment work was required in '93 nor in '94.

AN unusually big find is reported from the Silver King mine, sixty miles east of Phœnix, Arizona. It is stated that W. S. Champion "took out $40,000 in silver ore in three days," which is probably no greater than the usual exaggeration.

R. S. CATES, the manager, says work has been permanently resumed at the Baisley-Elkhorn mine, at Elkhorn mountain, Baker Co., Or., employing forty men. The property is now owned by the Deming Loan and Investment Co., Osage, Kan.

W. F. KENDRICK, of Denver, says: "The gold product of Colorado for the year just closed, as accurately as can be ascertained from the reports on the first of the year, is $16,995,919.51, or an increase of $6,379,456.51 over the product of 1894."

AT the Golden Cross group of mines, San Diego county, which has the largest number of stamps under one roof—140—in the State, about $275,000 has been spent. The cost of mining and milling the ore, including all expenses, is a little less than $1.50 per ton.

AT the Broken Hill Proprietary, Australia, for the week ending Dec. 19, '95, 5982 tons of ore were treated, yielding 440 tons of lead, containing 135,943 ounces silver; also 1158 tons, treated by amalgamating and leaching plants, producing 13,881 ounces silver.

NINE Leadville mines are reported sold to an English syndicate for $1,500,000. All the mines were fully investigated by experts from London before the transaction was closed. It has taken nearly six months to reach terms. The purchaser is the New Elkhorn Mining Co. of London.

LAST summer nineteen Portuguese rented ground at the old Cherokee mine, Butte Co., and proceeded to work it. The company has disbanded and in settling up found that they averaged $3.16 a day for each man. The ground they worked had already been worked over once.

THE British Columbia *Mining Journal* wants a law which will allow consolidation of mining leases so that work can be done on some one claim instead of each lease a company may hold. This legislation would be more particularly in the interests of the lease holders of placer ground.

THE wire tramway from the Hall mine to the smelting works at Nelson, B. C., has been completed and is in operation, bringing down ore to the bins at the rate of ten tons per hour. The buildings at the smelting works also are completed. The smelter has a capacity to smelt 100 tons per day.

POWDER is on the rise, and a cent a pound advance in dynamite is imminent. Since Oct. 1 glycerine has advanced three cents per pound, being now quoted at 12½. Though doing considerable business, none of the California powder companies are making much money, owing to excessive competition.

THE mill of the Champion mine in Bohemia district, Or., has shut down for the winter, the snow being about nine feet deep at the mill. Supt. E. P. Jennings announces that he has supplies and wood ahead at the mine for sixty days' continuous run, and expects to resume operations about the first of next April.

IN '49 came the California mining excitement, in '59 Pike's Peak, in '69 White Pine, in '79 Leadville, in '89 South Africa; '94 is "49" reversed and the mining activity that began in '94 bids fair to exceed in extent and value the first named period. California is destined to see greater stir in gold mining than ever before.

SINCE silver was found in sandstone and gold in coal nothing is surprising, yet it is, to say the least, a little startling to hear that at Perris, Riverside County, the Good Hope mine is running on adobe that averages $7 per ton. Feeding adobe to a stamp mill is new. The local paper says "it is a surface formation." It certainly is.

THE Pelatan-Clerici process, which has been in operation at the Midnight, N. M., mine, will be tested this month for the first time on a large scale in a 50-ton plant at De Lamar, Idaho. Another 50-ton plant is being put in at the Esperanza mine, near the City of Mexico. Mons. Pelatan is at present in Paris, and Mons. Clerici in Milan.

COL. LIGHTNER is superintendent of the Cinnabar mine, Savonas, B. C. Twenty-three men are at work, all but four being white miners. No smelting is being done at present. Drifts are being run and the mine opened up. This mine is said to be the only producing quicksilver mine in operation that is under the protection of the British flag.

THE United States Supreme Court has decided that a man, who was put off a train because a conductor refused a silver dime that was very much worn, was entitled to the $315 and costs which had been awarded him by the New Jersey courts, the Chief Justice declaring that silver coins were a legal tender as long as they bore the resemblance of coin.

THE Senate committee has decided to report favorable on the bill granting to each of the States of California, Oregon, Washington, Montana, Idaho, Nevada, Wyoming, Colorado and South Dakota, 25 per cent of all moneys paid to the United States by each of the States for mineral lands for the maintenance of a school of mines in each of the said States.

LAST Monday W. B. Cranston, working in the Virtue mine, near Baker City, Or., fell from the 470-ft. level 112 feet to the bottom, being instantly killed. He was in charge of a pump and had fallen asleep, allowing the pump to stop. When suddenly awakened by the car man, in a dazed condition, he raised the cross bar and stepped into the shaft, probably thinking that he was entering the cage.

FORTY representatives of the leading mining companies of Jackson, Josephine and other counties of Oregon met at Grant's Pass, Or., last Monday, and effected a permanent organization of the Southern Oregon Miners' Association. Officers were elected and future meetings arranged for. The object is to secure better legislation for the protection of mutual interests, and a diffusion of knowledge of interest to miners generally.

TO DATE there have been 198 applications to the U. S. Debris Commission at their office, 92 Flood building, this city, for application to mine. Of these, 5 were from Butte county; 15 from Nevada county; 29 from Sierra; 36 from Plumas; 14 from Placer; 23 from Amador; 9 from Shasta; 20 from Yuba; 10 from Calaveras; 2 from Sacramento; 32 from El Dorado; 2 from Tuolumne, and 1 from Lassen. Of the 198 applications, 141 have been granted.

THE receipts of treasure at San Francisco per Wells, Fargo & Co.'s express during the twelve months ending December 31, 1895, were as follows: From the interior, $21,725,878; from the north coast, $747,495; total, $22,473,373. The descriptions and amounts were as follows: Coin, $16,218,580; silver bullion, $2,601,987; gold bullion, $3,652,806. The inland shipments from San Francisco were $28,062,362, and the shipments overland were $500 in silver bullion; $35,138 in gold bullion and $17,117,785 in coin.

JAMES JACKSON, an educated Indian, personally carries the mails from Juneau to Fort Cudahy, on the Yukon river, Alaska. He uses twenty strong dogs to pull the sleds across the mountains to the Canadian postoffice on Forty Mile creek. This service is a private enterprise, being maintained by miners, who pay fifty cents for each letter. The Canadian government guarantees $350 for each of two round trips. It is a most hazardous journey. Several miners have lost their lives in trying to make it.

SENATOR DUBOIS of Idaho has introduced a bill providing for purchase of necessary land and the construction and equipment of sampling works, or for the leasing of suitable buildings and equipment for the sampling and assaying of imported silver ores and other ores containing lead, at El Paso, Tex.; Northport, Wash.; and Bonner's Ferry, Idaho, this being independent of the action of the Secretary of the Treasury in establishing similar works at other points where even larger quantities of ore are entered.

SUPERINTENDENT SHELDEN and eight other miners were fatally entombed by a cave in the Anna Lee mine at Victor, Colorado, last Saturday. They were descending the shaft when, at the depth of 280 feet, great masses of rock crushed the cage and its occupants. The upper workings of the mine were known to be unsafe, and from this distance it appears to be a case of negligence. The former owners of the mine had gouged its eyes out, making necessary a complete system of timbering, which had been deferred.

IN answer to the resolution of the House, Secretary Smith has sent to that body a letter from the Commissioner of the General Land Office regarding the lands of the Central and Union Pacific railroads. It shows as follows: Central Pacific—estimated area of grant, 10,248,224 acres; amount patented to date, 2,206,881 acres; amount of unpatented selections, 1,298,576 acres. Union Pacific railroad—Estimated area of grant, 13,295,104 acres; amount patented to date, 4,180,914 acres; amount of unpatented selections, 2,610.231 acres. Secretary Smith says that his reason for suspending the patenting of land to the bond-aided railroads was to leave them in the condition where Congress would have all possible freedom of the dealing with the subject.

AN improved miners' cage is reported from Montana, the principal feature being a method of doing away with the accidents to life and limb and the destruction of property in mines using the old-style chairs. In this new arrangement the chairs being made a portion of the cage, a slight pressure of a lever suffices to throw them in or out at will, so that the station tender can in no case leave the chairs in, as they fly back as soon as the engine takes the load off them. They can also be employed very serviceably in making repairs to the shaft, such as retimbering, etc., resting as they will on any set of timbers, and the workmen in the shaft are assured far greater safety with the cage resting on the chairs than if it were hanging by a rope or cable—the fact being well known that a frequent source of trouble at all mines has been due to allowing the cage to drop on the chairs at a station. With this improved arrangement the only source of damage is that of dropping the cage into the sump or hoisting it into the sheaves.

THE Colorado "boom" goes on, and while there are undoubtedly several very rich gold producing districts, some of the statements seem exaggerated, to say the least. The following is a sample of what is being sent out, being the latest noticed: "Boulder, Col., Jan. 9.—Intense excitement prevails in this city over the new gold fields, situated between South Boulder Creek and Magnolia, and there are rumors of riches being uncovered by prospectors in holes not even five feet deep. The strike is alleged to be worth $100,000, and an offer of this amount is said to have been made and refused. Frank D. Baker came down from Walker's ranch and reports that several sacks of quartz had been sent to the sampling works from the claim discovered by the White brothers. The gold was sticking out all over the quartz, and no accurate estimate could be formed of the value of the stuff, but it will be sold by the pound instead of ton. The pannings made from the ore are said to be wonderful, as great rings of gold form around the pan with each test of washing. The prospectors are wild over the outlook for a great mining boom, and about 500 men are working night and day in search of veins. The new gold discoveries are on the same mineral belt as the rich telluride mines of Ballarat, Jamestown, Gold Hill, Sunshine and Magnolia. In each of these districts mineral has been uncovered at the grass roots." Miners do not believe such glowing statements in Colorado or anywhere else, but probably such reports are not intended for "home consumption."

## Notes on Gold Milling in California.

NUMBER IX.

By E. B PRESTON, M. E., Field Assistant State Mining Bureau.*

MILL ASSAYS.

*Amalgamation (Free Gold) Assay.*—Take two pounds (being exactly one thousandth part of a ton) of ore, crush in an iron mortar, and pass through a No. 60 sieve; remove the gold and other metallic substances left on the sieve, and place in a small porcelain dish containing a little dilute nitric acid, to remove any adhering crusts of oxide of iron, etc., which might prevent amalgamation; these residues are then carefully washed and thrown into the sifted ore, which is then placed in a wedgewood-ware mortar and mixed with enough warm water to make a stiff paste. To an ounce Troy (480 grains) of new, clean mercury, *free from gold*, add a piece of clean sodium about the size of a pea. The mercury thus highly charged with sodium is then thrown into the mortar containing the sample, and the mass ground constantly for an hour, when amalgamation should be quite complete. The mass is then transferred to a gold-pan and *carefully* washed over another pan or tub, in which the tailings are caught, and re-washed to save anything which may have escaped. The mercury is collected and transferred to a small dish; if it be much floured and refuse to run into globules, stir it with a small piece of sodium held in the end of a glass tube, which will cause it to run together. The mercury is then washed carefully in clear water and dried with blotting paper. It is then re-weighed, and if the loss exceeds 5% the assay must be rejected and a new one made. The mercury is next transferred to a small annealing-cup or crucible, which has been carefully black-leaded inside, covered with a porcelain or clay cover, and volatilized with a gentle heat. When all the mercury has been volatilized, about fifty grains of assay lead are thrown into the crucible and melted, giving it a rotary motion while in a molten state. It is then removed, cupelled, and the "button" weighed. It may be assumed without sensible error that the mercury lost in the operation carried the same proportion of gold as is contained in the mercury recovered; hence the gold contents of the ore will be found by multiplying the weight of the "button" obtained by the weight of the original quantity of mercury, and dividing the product by the difference between the weight of the mercury recovered and the "button." This figure multiplied by 1000, gives the weight, in grains, of the free gold and silver per ton of ore, which, for all practical purposes, may be assumed to be all gold. Should, however, greater accuracy be desired, hammer the "button" flat and thin, and dissolve the silver from it with nitric acid and weigh the gold. The difference in weight represents the silver.

*Panning Assay.*—Take two pounds of ore, crush, and pass through a No. 40 sieve; any gold in the residue left on the sieve being set aside. The sample is then carefully panned, and the tailings re-panned, to make sure nothing is lost. This operation will show at once whether the ore is rich in sulphurets or not, and the nature of them. The visible gold should be panned as free as possible from all the sulphurets, taking care that none is lost. The pan and its contents, together with the residue left on the sieve, are dried by holding over a fire; the contents are brushed into a cone of lead-foil, rolled up, melted, and cupelled. The "button" is weighed, and the free gold determined by multiplying its weight by 1,000.

The tailings produced in the panning operations should be panned over several times to collect all the sulphurets, which should then be dried, weighed, and their percentage in the ore determined.

Another method consists in not separating the free gold from the sulphurets, but in treating them both together by fire-assay, and determining the *total* value of the gold present in them. The operations, as far as described, are all that can be properly considered as coming under the term of battery amalgamation as practiced in California, if we except the use of the riffle and blanket sluices; these are placed below all the plates, and receive a very spasmodic attention in the majority of mills. Blankets are laid in strips, about sixteen inches wide and about six feet long, overlapping each other in double sets of sluices, set on a grade of about three-fourths of an inch to the foot, washed in a separate water-box. The material thus obtained, with the contents of the riffles, is deprived of its valuable contents by the aid of arrastras, pans, or Chili mills. But few blanket-sluices are found to-day in California mills.

On the practical development of the Plattner chlorination process, by Mr. Deetken, in the "sixties," it was demonstrated that many of the low-grade quartz veins carried enough gold in their sulphurets to make their working profitable, causing attention to be directed to the concentration of these ores by mechanical contrivances. From the constant and successful use of the gold-pan the mechanical application of a similar motion was sought, resulting in the use of the Hendy and similar concentrating machines.

The Hendy concentrator consists briefly of a shallow iron pan with an annular groove on the outer edge and a waste discharge in the center. It is supported on a central upright shaft passing through the center of the pan, on which revolves, above the pan, a central bowl to receive the pulp, having two tubular arms extending close to the outer edge of the pan; these uniformly discharge the pulp at right angles from their axis. At a point on its circumference the pan is attached to a crank-shaft, making about 220 revolutions per minute. The sulphurets and small balls of amalgam gather in the groove at the outer edge, from whence they are drawn through a gate, which is regulated to be automatic in its discharge. This gate is not opened until the groove is pretty well filled with sulphurets. Two of these machines, driven by one shaft, are required for a five-stamp battery. The machine needs constant attention; one man can attend to twelve machines on a shift. They have been mostly displaced by the endless-belt machines which have developed from the endless blanket and shaking-table.

In 1867 the first patents for the revolving belt were issued. This was the commencement of the belt concentrators, of which at present the Frue, Triumph, Woodbury, Tulloch, Embrey, and Johnston are representatives. To produce the best results on these machines, all the stuff should be *sized*.

*The Frue Vanner*, which has the largest representation in California gold mills, has been frequently described. It has a side shake of one inch, with from 180 to 200 strokes per minute, the belt traveling upward on an incline form three feet to twelve feet per minute. The belt is made in two sizes, four feet and six feet wide, and in the latest patterns as made at the Union Iron Works, San Francisco, has practical arrangement for easily changing the slope at the upper end. The frames of these modern styles are made of iron instead of wood. The pulp is discharged very evenly over the belt from a distributor near the upper end, just below the point where clear water is discharged in fine jets across the belt. In placing the machine, attention must be given to the solidity of the frame, and that a perfect level be obtained across the belt; further, the pulp and clear water must be distributed in an even depth of about one fourth of an inch; the grade and upper travel depend on the fineness of the pulp, and must be regulated accordingly.

The following guide for a proper condition of the work on the belt is given by Henry Louis, E. M., F. G. S.: "The working conditions should be so adjusted that a small triangular patch of sand should show at each of the lower corners of the belt. These sand-corners should not be too large, but must be well marked, and the two should be of equal size. Should they be unequal the fault will be found to be either in that the belt is not accurately level across, that the distributor is not doing its work properly, or that some of the working parts have not been properly tightened up, so that there are other motions than the normal ones communicated to the belts. Too large a corner of sand shows that the pulp is too thick, while absence of any corner indicates that it carries too much water.

Two of the four-foot belt vanners, or one of the six foot, handle the pulp from a five-stamp battery. The amount of clear water required to be added is about one-fifth of a cubic foot per minute; the vanner requires about one-half H. P."

*The Triumph* differs from the Frue, principally, in that it has an end shake of one inch and slightly quicker stroke (230 per minute), the belt making a forward movement of three feet to four feet per minute. It receives the pulp in a bowl containing quicksilver before reaching the distributor, which is all kept in agitation by revolving stirrers.

*The Woodbury* is similar to the Triumph in extent and number of motions, but divides the belt into seven longitudinal partitions; an increased output being claimed for this construction.

*The Tulloch* gives a rocking motion from a fulcrum on the floor, making 140 shakes of one and three-eighths inches per minute, using either canvas or rubber belt. This machine, it is claimed, saves a somewhat larger amount of the finer and richer grade of sulphurets as compared with the former types.

*The Embrey* is similar to the Frue, but with end shake.

*The Johnston*, with improvements, and the latest of the belt concentrator placed on the market, claims many points of advantage. It is suspended from four non-parallel hangers capable of adjustsment, by which the angle of oscillation can be changed as required, preventing the accumulation of sand at the edges, such as occurs with the horizontal side-shake machines, or the piling of the sands in the center of the belt, that occurs with the rocking motion. The motion imparted to this belt resembles more nearly that of the batea than that of any of the other concentrators. The belt is made of No. 6 duck, oiled and painted, but a rubber belt can be used at one-third the cost of those with molded edges, which are short-lived. Small, hollow, brass, side-rollers on the shaking-frame, form the raised edges by curving the flat belt slightly upwards. The pulp is delivered from five slots running parallel with the belt frames, one-fourth of an inch wide and sixteen inches long, leaving ten-inch spaces, into which the pulp is thrown when it strikes the belt. Here the separation at once takes place; the sulphurets settling on the belt are carried by it up to the clear water, while the sands are carried down the belt. In neither case are the sands or sulphurets obstructed by the falling of water and sands, as in other machines where the pulp is discharged across the belt. The clear water at the head of the table, instead of being discharged from a stationary box to the moving table, is discharged from a distributor, which is attached to and moves with the table, thus stripping the belt of the smallest possible portion of sulphurets. Two widths of belt, fifty-four inches and seventy-two inches, are used, which are given a grade of one-fifth of an inch to one-fourth of an inch to the foot, making about 118 side-shakes per minute. One machine handles the pulp from a five-stamp battery.

Another vanner, soon to be placed before the mining public, consists of the essential features of the vanner, but carries a rubber belt with depressions all over it, two inches in diameter and one-eighth of an inch deep, shaped after the batea, while the entire belt receives a motion corresponding to that given to a batea.

As the motion and grade given to any of these machines can only be correct for a certain size of grain in the pulp, it would be advisable to introduce some method of sizing the pulp previous to bringing it on the concentrator, and feeding the sized material to different machines. The finer the screen that has been used in the battery, however, the less does the lack of sizing affect the product from the concentrators. The concentrators should always, where possible, be attached to power independent from the stamps, and be placed on a floor below the aprons in a position to permit the attendant to pass all around and to conveniently transport the concentrated stuff to the covered drying floor, which should be made with a slight incline, perferably of concrete, and exposed to sunlight.

*Canvas Platforms or Tables.*—Investigation proving that the slimes passing off with the waste from the mill and concentrators still carried an appreciable amount of precious metal, millmen during the last few years have extended their operations, and re-treat the hitherto escaping slimes. This is done by conveying all the waste material from the mill, through sluices, to canvas platforms having the following general features.

A platform is built of clear, seasoned, and planed, one and one-quarter inch planking, on a solid, level foundation, and given a grade of about three-fourths of an inch to the foot, over which No. 6 canvas is stretched smooth, longitudinally, though sometimes crosswise, with a two-inch overlap. Particular attention must be paid that the canvas is stretched smoothly and evenly and that no crack opens between the planks constituting the platform. The length and width of the platform required depends on the amount of pulp to be handled; overcrowding must be avoided. The platform is divided longitudinally into sections corresponding to the width of the canvas, which is twenty-two inches; the partition is made of wooden strips, two inches wide and one-half of an inch high, covering one inch on the edge of two adjoining pieces of canvas. Running along the head of the platform are two sluices, one placed above the other; one containing clear water, the other pulp from the mill, both furnished with three-fourths of an inch to one inch plug-holes over each section. Below the lower edge of the platform are two sluices placed side by side, the inside one to convey the waste, the outer one for the concentrates (sweepings) from the platform. When ready for operation, the plugs are withdrawn, and both pulp and clear water commingled flow down in an even current and are discharged through the bottom waste sluice. After one hour or less, the plug is inserted in the pulp-box over the first section, and the clear water permitted to run for a few minutes longer, during which time quartz sand may be observed passing off the canvas, leaving a dark, partly metallic-appearing sediment on the canvas. A tray or board is then placed over the waste sluice, connecting the lower edge of the section with the outside sluices, and the sediment is removed from the canvas, either by sweeping or with the aid of a hose with a flattened nozzle, to be worked later by chlorination or cyanide process.

(*To be Continued.*)

* Bulletin No. 6, California State Mining Bureau.

## Ore Treatment—Cyanide and Chlorination.

The possibilities and probabilities of ore treatment are constant subjects of discussion. In all cases the process must be suited to the ore. On this subject W. P. Harvey, of Vancouver, B. C., says:

The ore found in the Cariboo, Fairview, Boundary, Osoyoos, Yale, Alberni, and some in Nelson, are not adapted, as a rule, to any smelting process, but rather to milling as applied to amalgamation, chlorination, and cyaniding. The Cariboo mines produce large quantities of refractory ore—by this is meant that containing as an impurity of the rock itself, sulphur and arsenic; in such cases a portion only of the gold exists uncoated, the balance being invisible as such. These ores are usually treated by amalgamation, when there is a considerable loss, as the coated gold will not give itself up to mercury, because its surface is not directly exposed to it. Of late years, instead of roasting to drive this impurity away, it has been found cheaper to treat the tailings by subjecting them to the action of a solution of cyanide of potassium, which attacks the coated gold of the tailings and dissolves it, when the solution containing the precious metal is passed over zinc shavings, which is the means of precipitating it in metallic form; this is collected and melted, the solution passing beyond the zinc being free from valuable products, but ready for another set of tailings. The Yale ores, however, are mostly free. At Fairview, 60 per cent of the gold contained only is free, and here the process named has been found to be equally as amenable as has been proved to be the case in the Cariboo. With Alberni ores some are too rich for any other treatment than free milling, but the majority can only be handled economically by the use of an accessory to the amalgamator. * * * * The chlorination process has been tried in this country, and found too expensive for commercial purposes.

On the other hand, J. E. Rothwell of Denver, Col., claims that in Colorado chlorination is of more advantage than the cyanide process. He says it is a well known fact that a solution of chlorine in water is a very efficient and rapid solvent of gold, much more so than cyanide and about the same as bromine. The relative dissolving powers of the different solutions as given by Rose in his "Metallurgy of Gold" is as follows:

Chlorine—Saturated solution in water (about a 1 per cent solution), 1½ hours, 4.49 per cent.

Bromine—1 per cent solution, 1½ hours, 6.46 per cent.

Cyanide—1 per cent solution, 1½ hours, 0.57 per cent.

In each case the temperature of the solutions was 60° Centigrade.

It has been said that 1 ton of chemicals as at present used in the chlorination process will treat only 20 tons of ore; while 1 ton of chemicals used in the cyanide process will treat 100 tons of ore. This is a mistake, as 1 ton of chemicals in the chlorination process has been proved to treat from 60 to 150 tons of ore, and even in some cases nearly 200 tons of ore; this when using chloride of lime and sulphuric acid, but when it is considered that of the chloride of lime used only 30 per cent of its weight is available as chlorine and acid has to be used to liberate it, it will be seen what the present reason is for having to handle a great amount of freight. Now, however, a great advance in the chemical industry has been made, and it is possible to get chlorine in a practically pure state, thus eliminating the freight on 75 per cent of the necessary chemical. And as equal quantities of chlorine or cyanide in a solution will treat the same ores, except that chlorine will be about eight times as fast as cyanide, and as the relative cost of the two chemicals is as 20 cents to 55 cents per pound, it can readily be seen where chlorine has the advantage, and the cost in one particular will be materially reduced. But this is not the case that shows the greatest possible advantage that the chlorination process has over the cyanide, as by recent improvements it has been proved possible to manufacture chlorine from salt direct, by electrolysis, at an expense of from 5 cents to 7 cents per pound; therefore, when a large chlorination mill is built that will make their own chlorine, it can readily be seen how much cheaper the treatment can be made.

Other advantages that chlorination has over cyanide is that it is not necessary to reduce the ores as fine for chlorination as for cyanide, and it is well known to mill men that where 80 tons of ore can be reduced to 10 or 12 mesh, sufficient for chlorination, only 30 tons can be reduced to 30 mesh, absolutely necessary, except in rare cases, as at the Mercur, for cyanide, thus reducing the amount of crushing plant necessary, and therefore the cost of crushing and wear and tear of machinery.

It has been claimed that the cyanide process does not require the ore to be roasted, and that chlorination does. This is not always true, as it has been demonstrated in several cases in America that certain ores will not yield their good contents to cyanide without roasting. It has also been demonstrated that certain low-grade silicious ores will yield a very high extraction by chlorination without any preliminary roasting, showing that even in this particular the advantage is not all with the cyanide process. In any case the roasting of ores is a comparatively cheap and simple matter, as manufacturers of roasting furnaces are ready to put in furnaces and guarantee that ore can be roasted for from 30 cents to 35 cents per ton.

As to the relative cost of the works to treat by either process, this is practically the same in each case.

A resume of what chlorination will cost on Cripple Creek ores as compared with cyanide would be about as follows:

| | *Chlorination.* | *Cyanide.* |
|---|---|---|
| Sampling, per ton | 0 30 | 0 30 |
| Crushing, per ton | 0 50 | 0 50 |
| Roasting, per ton | 0 35 | 0 00 |
| Chemicals, per ton | 0 60 | 1 00 |
| Labor, per ton | 0 75 | 0 75 |
| Amortization, per ton | 0 25 | 0 25 |
| Totals | $2 55 | $2 80 |

To cyanide the royalty must be added, amounting to from 50 cents to $1.50 per ton, according to the grade of ore treated and the good will of the managers of the process.

If the cheaper method of producing chlorine is added to the works the cost of chemicals will be reduced about one-half, and should any of the large mines put up their own works the labor and cost of sampling would be reduced, making the whole cost still less.

It is a well known fact to those familiar with the action of the two processes that the extraction on all grades of ore by the chlorination process is uniformly high, ranging from 92 per cent to 98 per cent, while that of cyanide is such that the cyanide mills do not care to accept any ore that runs over 0.6 to 0.75 ounces per ton, by reason of the lower extraction made and having to pay $19 an ounce for the gold in the ore.

At the Golden Reward Chlorination Works, the pioneer works in America, where they have treated upwards of 200,000 tons of ore since starting in 1890, the cost of treatment has been reduced to $3 per ton, and they are adding improvements that will still further reduce this figure.

As an instance of what chlorination can do on tailings, under similar conditions to cyanide, the following figures, to be found in Rose's "Metallurgy of Gold," taken from a report of the Fahlun Copper Works, Sweden, can be considered authentic. Tailings from 14,000 tons of ore were treated. Gold in tailings before treatment, 41.82 grains; value, $1.798 per ton; gold in tailings after treatment, 4.04 grains; value, $0.175 per ton; extraction, 90.34 per cent.

| *Cost per ton—* | | | |
|---|---|---|---|
| Chlorine of lime, 6 pounds | 5d | or | 0 10c |
| Sulphuric acid, 8.37 pounds | 1d | or | 0 02c |
| Acetate of lead | ¾d | or | 0 015c |
| Fuel for steam | 1¼d | or | 0 025c |
| Total cost | 8d | or | 0 16c |

If we reduce these figures to American prices, we find that the cost is about 55 cents per ton. It would have been impossible to have used cyanide at a profit on this grade of material.

The lowest grade of tailings being treated by the cyanide process in America is probably at the Harqua Hala, in Arizona, where the value is $4.10 per ton and an extraction of 76 per cent obtained, according to the manager's report to the company. This is about the same extraction as obtained in South Africa on tailings of from 4 to 6 pennyweights, and the cost of treatment of which, not including royalty, ranges from $1.25 to $2.50 per ton.

It is not hard to figure where the profit to a chlorination mill will come from out of a $5 treatment charge, when the actual cost of treatment will not exceed $2.55 per ton, and chlorine extracts from the ore the full value paid for, and in the higher grades from 2 to 5 per cent more.

In defense of the cyanide system a writer in the *Mining Industry and Review*, of Denver, says:

In the United States, abandoned deposits of gold and silver ores are being reopened by the use of the cyanide process with the certainty that these enterprizes can now be made highly profitable.

The known existence of low-grade gold and silver deposits similar in many respects to those found in South Africa is not alone sufficient, but, in combination with the cyanide method to recover the values successfully, should bring up the production of the precious metals in this country to a figure second to none in the world.

In substance, the MacArthur-Forrest invention consists not merely in discovering that a dilute solution of cyanide could be used to extract gold from its ore, but showing the public the best practical method of doing it by leaving baser metals behind, which had never occurred to any one before, and is the keystone to the whole cyanide process. The process consists in breaking the ore to a granular product and then subjecting it to a weak cyanide solution. When the gold in the ore is known to be dissolved, the cyanide of gold solution is allowed to trickle through a mass of bright zinc shavings, and trickles out gold—free. The porous mass of zinc forms a chemical filter, which at once precipitates and collects the precious metals. When the gold is deposited, the filliform mass of zinc with gold and silver powder adhering is vigorously shaken in water, when the precious metals fall off. The gold and silver is then collected and fused directly into bullion bars of almost pure gold and silver.

The cost of treating crude ores in the United States averages $3 per ton with extractions varying from 80 to 90 per cent of the precious metals. Tailings are treated at an average cost of $1 per ton with extractions of 70 to 80 per cent.

According to the report of the Witwatersrand Chamber of Mines of date of October, 1895, forty-three cyanide mills at Johannesburg run on tailings, all of them using the cyanide, or MacArthur-Forrest, process. In September over 200,000 tons of tailings were treated. The total product claimed to have been recovered by cyanide for the month of September is valued at $1,000,000.

In New Zealand the MacArthur-Forrest process has produced 99 per cent of the Upper Thames output and 80 per cent of the Kuaotunu output.

In the United States the process is at present in successful operation on low-grade ores and tailings in various mills in Colorado, New Mexico, Arizona, Utah, Idaho, Montana, South Dakota, Oregon, Nevada and California. Prior to its adoption these ores and tailings were yielding no revenue to their owners.

*Colorado.*—The Metallic Extraction Company, Mr. Eben Smith, president, have been operating a 100-ton MacArthur-Forrest plant for the past four months at Florence. The mill is now being increased to a capacity of 300 tons per diem. Mr. David H. Moffat, president of the First National Bank, Denver, is a large shareholder in this company. The Livingstone Gold Mining Company, Boulder county, have produced over $40,000 since being in operation. The Brodie mill, fifty tons per diem plant at Cripple Creek, has produced for the past six months over $54,000 worth of bullion.

*Utah.*—The well-known Mercur mine has used the cyanide process for the past three years, and has paid dividends to the amount of $350,000. The mill capacity is about 175 tons every twenty-four hours. When the Mercur Company first adopted cyanide it was deeply in debt. The Marion Company is treating over fifty tons per diem. The Sunshine Company has commenced operations with a plant of 150 tons daily capacity. The above mills are all in the Camp Floyd mining district. Several smaller plants are operating in other parts of Utah.

*South Dakota.*—The Black Hills Gold and Silver Extraction Company are operating a fifty-ton plant at Deadwood. Recently a fifteen days' run is said to have produced a bar of bullion valued at $30,000. The Custom M. & M. Co. own a twenty-five ton tailing plant.

*Nevada.*—The Union Mill Company, Tuscarora, have been operating a large heap of tailings. Two other plants have been treating tailings for some time past.

*New Mexico.*—For three years past the North Homestake tailings have been treated successfully.

*Arizona.*—Two fifty-ton tailing plants at Wickenburg, Maricopa county, have been operating successfully. The Congress Gold M. Co. and the Harqua Hala M. Co. are each treating over 100 tons per diem. The Grand Central mine dump is also being successfully treated by the cyanide process.

*Montana.*—The Revenue fifty-ton plant, in Madison county, and the Ammon-Stivers M. & M. Co. are using cyanide.

*California.*—The following mines are at present successfully operating with cyanide: The Bodie M. & M. Co., Mono county; the Fulton Foundry; the Standard Con. M. Co.; Messrs. Parr and Tyack and Judge Bicknel. Total tonnage per month, 10,000 tons.

*Oregon.*—The Eureka and Excelsior mines, Baker county; capacity, fifty tons per diem.

The completion of mills now in course of construction and for which licenses have been granted by the Gold and Silver Extraction Company of America, Ltd., controllers of the MacArthur-Forrest process for the United States, should increase the tonnage, within the next twelve months, of ores treated by cyanide to at least 50,000 tons per month and add largely to the production of gold in the United States.

The possibilities of the process are such that it is safe to predict cyanide will recover as much gold, if not more, in the United States than it is doing in Africa, where 40 per cent of the total value of gold produced is by the MacArthur-Forrest cyanide process.

---

A NEW YORK professor, afflicted, or blessed, with a glass eye, has devised a striking mode of converting this little accessory to uses other than mere ornament. Hermetically sealed within the shell of the glass eye is a minute one-candle power electric glow lamp, of the kind used by surgeons. This ocular lamp is operated from a small storage battery, conveyed in the professor's pocket. The luminous eye acts like a dark lantern, whenever desired, simply by the natural closure of the eyelid over it. For reading in bed, or in the train, or conducting any physical research, it proves an admirable convenience. At first sight, to a casual observer, the luminous orb wears a fearsome, or at least startling, aspect. In fact, it would be ill-advised to mingle in general society with the eye in use.

## Mines and Mining In Nevada County.

NUMBER I.

By SAMUEL BUTLER.

Mining is the staple industry of this county. All other industries and pursuits revolve around it and are dependent on it. On its success depends the financial and commercial prosperity of our citizens and business men. When our mines are prosperous and productive, commerce is brisk and the people are correspondingly happy, and vice versa. It is the object of the writer, in conformity with an annual custom, to give the readers of the MINING AND SCIENTIFIC PRESS a resume of this important industry in our county from the standpoint of a practical miner. The aim of this article is retrospective and prospective. It is the intention here to calmly and dispassionately review the past and to offer some suggestions regarding the future of our mines. In this particular the assertions here made will be influenced only by the accomplishments of the past. Gross misrepresentations and garbled statements will be avoided and reliable data only will be used as a basis on which to found the following paragraphs.

Since its inception Nevada has borne the proud distinction of being the banner gold-producing county of the State. Although competition has been active and keen, and sometimes she has been very hard pressed in the race for supremacy, her competitors have never been able to wrest the wreath from her golden brow, with but one solitary exception, and at this writing there is strong reason for believing that the production of 1895-6 will again place her in the role of leading gold-producing county of the State. In saying this we do not wish to detract from the importance which should be attached to the splendid production of Calaveras county, which Mint Statistician Yale places at the head of the list of gold-producing counties for 1894. Nevada county is neither envious nor jealous of the laurel won by her sister county in the struggle for supremacy. We stand prepared to congratulate her on her splendid achievement, and express the wish that every mining county might be capable of duplicating her great production in the near future. For experience has taught us that success and prosperity in the gold mining industry is indicative of prosperity in commercial and financial circles. Therefore, with a feeling of patriotism characteristic of miners generally, we glory in the success of Calaveras county and a general prosperity throughout the State.

But at this juncture it may be well to point out a delinquency observant in many of our mining companies and which is not generally known by those conversant with the condition of our industry. I refer to the reticence of our superintendents when appealed to by the proper authorities in giving the annual production of the mines under their supervision. There is no tangible excuse for such action, as no harm can result from giving to the world the amount of gold produced in each mine every year. On the other hand, irreparable injury is inflicted on the county and its industries by withholding from the public, and capital especially, the figures which they anticipate and which are intended to impress them with the magnitude and importance of our mines. By what method is outside capital to become cognizant of our production if every mining company insists on refusing to publish the amount produced each year? It is this annual publication which attracts and interests capitalists other than those now engaged in the development of our mines and which parades before the world the wonderful resources at our command. But some of our prominent mining companies doggedly refuse to inform the public of their productions, with the result that no accurate estimate of our gold production can be obtained. After a careful study of the situation, I am prone to state that only about three-fourths of the gold production of this county is recorded per Mint request. This is very regrettable, in view of the great expense incurred by the Mint and State Mining Bureau in collecting these statistics annually for public information and distribution. It also retards the progress of the county, while other sections are laboring earnestly to collect statistics regarding the full production of their mines and for the purpose of impressing the general public with the greatness thereof.

To those acquainted with the mining industry in this county the decrease in production in 1894 is not surprising. It was the inevitable result of a series of misfortunes that were regrettable and unavoidable. The reason for this diminution in production I clearly pointed out in an article published in these columns a year ago. I then referred to the burning of the Maryland plant, which threw 200 men out of employment, the suspension of the Champion mine through injunction, which disemployed 150 men, and the cutting off of the rich North Star vein, which seriously affected 200 men employed at the time. These incidents, combined with other annoying and injurious reverses, caused the diminution of 1894 and placed Nevada third in the list of gold-producing counties. Whether the production of 1895 will regain the prestige lost in 1894 is still a matter of conjecture, but it is safe to say that the production of 1896 will again put her at the head of the processsion. Everything tends to sustain this assertion. The rehabilitation of hydraulic mining, under the Caminetti and Ford acts, which has not yet been evident in the way of increased production, will greatly augment our gold output in the near future. Preparations have been made in compliance with the supervision of the National and State Debris Commissioners for the resumption of some of our largest hydraulic mines. There has also been a reopening of several abandoned mines, notably the Massachusetts Hill, Bullion and Banner in Grass Valley, the Merrifield, Cadmus, Home and Gold Tunnel mines in Nevada City, which formerly were very productive properties and which it is hoped will again add greatly to our gold production.

*(To be Continued.)*

## Balance Sheet of a South African Mine.

The following is the official report of the directors of the Wemmer mine at Johannesburg, South Africa, for the month of October. The Wemmer is what is called a "main reef mine;" its capital is £55,000; its market value, £550,000; it is six years in existence; its present monthly profit is about £11,000. The figures below are of interest to the American miner:

EXPENDITURE AND REVENUE.

EXPENDITURE.

| | | Tons. | Cost per ton. | |
|---|---|---|---|---|
| Mining account | | | | £5,725 1 6 |
| Sorting account | £495 12 11 | | | |
| Less stone sold | 188 5 6 | | | |
| | | | | 307 7 5 |
| Water service from pan to mine | | | | 5 6 3 |
| | | 10,985 | 10 11.91 | 6,037 15 2 |
| Reduction expenses— | | | | |
| Crushing ore | 1,158 3 5 | | 3 3.42 | |
| Concentration | 230 10 6 | | 0 7.85 | |
| Tailings wheel | 14 4 11 | | 0 0.48 | |
| Electric lighting | 33 4 11 | | 0 1.13 | |
| Breaking rock at main shaft | 126 5 7 | | 0 4.29 | |
| Transportation of ore to mill | 217 10 9 | 7,052 | 0 7.40 | |
| | | | | 1,780 0 1 |
| General charges— | | | | |
| Licenses, medical expenses, directors' fees, sanitary expenses, accident and fire insurance, salaries and charges | | 7,052 | 1 2.07 | 413 12 0 |
| Development redemption | | 7,052 | 7 0 | 2,467 10 0 |
| | | | 24 2.55 | |
| Cyanide works—Treating | | 4,375 | 3 5.97 | 765 3 6 |
| | | | 27 8.52 | |
| | | | | 11,464 1 3 |
| Profit for month | | | | 11,057 12 10 |
| | | | | 22,521 14 1 |

REVENUE.

| | | |
|---|---|---|
| Gold account—4098.63 ounces bullion realized | | 14,954 6 1 |
| Cyanide works—1585.05 ounces bullion realized | | 5,433 11 4 |
| Concentrates estimated for October production | 2,499 0 0 | |
| Less deficit on September production | 365 3 4 | |
| | | 2,133 16 8 |
| | | 22,521 14 1 |
| Total amount spent on development, including 423 feet of driving and sinking | | 1,933 4 5 |

CAPITAL ACCOUNT.

| | |
|---|---|
| New incline main shaft | 375 15 6 |
| Buildings and general improvements | 1,062 1 0 |
| | 1,437 16 6 |

MILLING RESULT FOR OCTOBER.

| | |
|---|---|
| Stamps at work | 50 stamps. |
| Working time | 30 days. |
| Tons crushed | 7,052 tons. |
| Tons crushed per head per day | 4.70 tons. |
| Bar gold extracted | 4,098 63 ozs. |
| Yield per ton crushed | 11.62 dwts. |
| Tailings treated | 4,375 tons. |
| Bullion returned | 1,585.05 ozs. |
| Concentrates caught | 160 tons. |
| Assay value | 5 ozs. 6 dwts |

The total yield per ton, including extraction from tailings and concentrates, is 18.78 dwts. fine gold.

## Cedar River Gravity Water Supply for the City of Seattle, Washington.

At a special election held on December 10, 1895, by more than three-fifths majority of the voters, it was decided to extend the city water works by adding a gravity supply from Cedar river, at a cost not to exceed $1,250,000.

The present source of supply is Lake Washington, which lies immediately east of the city. Its elevation is about fifteen feet above mean high tide of Seattle harbor. From the principal pumping station at the lake the water is raised to a reservoir of four and one-quarter million gallons capacity, at an elevation of 305 feet. From this reservoir the principal section of the city is supplied, and two auxiliary pumping stations serve the higher residence districts to an elevation of about 480 feet. The distribution system includes more than one hundred miles of pipe lines, varying in size from two to thirty inches. The average daily consumption is somewhat in excess of five million gallons, the maximum being about seven million gallons during the summer months.

During five years of municipal ownership the receipts from the water works have not only been sufficient to pay all expenses of operation and maintenance but have created a large surplus revenue, available for general purposes. During the same time water rates have been reduced fully fifty per cent.

Before acquiring the present system the city secured the services of Mr. Benezette Williams, C. E., of Chicago, as consulting engineer, and under his direction an exhaustive series of surveys was made in 1889 and 1890. His report was submitted on February 21, 1890, and was followed with detail plans and estimates. The plan located the source of supply on Cedar river, about twenty-five miles southeast of the city. At this point the river has an elevation of 513 feet above tide and the flow varies from 115,000,000 gallons to 1,500,000,000 gallons per twenty-four hours, at the respective low and high-water stages, the river being a mountain stream from the Cascades and subject to great fluctuation of flow. It was proposed to build a timber and earthen dam across the narrow river valley to a height of twenty-one feet above low water, thus raising the water surface to 534 feet above tide. From this point, by means of a V-shaped flume, a flow of 50,000,000 gallons per day was to be diverted and carried to Swan lake, a distance of about eight miles. Swan lake is a clear, deep lake, with gravelly bottom and with generally steep banks and precipitous shores. Its water surface is about 600 acres and at an elevation of 468 feet above tide. The plan proposed a dam at the outlet of the lake, raising the water level to 485 feet above tide, thus increasing the water surface to 800 acres. The location of Swan lake is such that besides serving as an impounding reservoir it saves two and one-half miles of pipe line between Cedar river and the city. Mr. Williams proposed to draw the city supply from Swan lake through a tunnel about one mile long and a forty-two-inch pressure conduit of fourteen miles length to a city reservoir at 300 feet elevation, continuing two and one-half miles farther to a high-service reservoir at 425 feet elevation. By arranging for alternate discharges into these city reservoirs, nearly the entire city would be served by gravity from a supply system with a capacity of 25,000,000 gallons per day. The plan proposed a main supply pipe made of three-inch wood staves, securely banded with wrought-iron or steel bands, the outer surface of the staves and bands to be coated with asphaltum.

The estimated cost of the supply system as then proposed by Mr. Williams was $1,200,793.65, and of furnishing and laying distribution pipes in the city $535,052.86.

During 1890 the city purchased the plant of the private corporation which had heretofore furnished the water supply, and constructed most of the city distribution system as recommended by Mr. Williams, postponing construction of the Cedar river gravity supply system. The economy of the plant during the past five years has been such as to thoroughly convince the people as to the benefits of public ownership. Although the expense of operating, maintaining and renewing the pumping plant has been large in comparison to the economy of a gravity supply, it was not deemed advisable to increase the obligations of the city by adding the Cedar river supply until it became absolutely necessary.

Within the past year, however, it was very clearly indicated that an effort was being made to control and develop the ultimate city water supply for private profit. This condition of affairs stimulated action by the City Council towards immediate construction by the city, which action was duly ratified by the people at the special election on December 10th.

It is now proposed to construct the supply system substantially in accordance with the recommendations of Mr. Williams as to location, routes, etc., but with some modifications as to character of construction. Two reservoirs will be constructed in the city, of forty and twenty-five million gallons respectively. The cost of the proposed additions, including all lands, water rights, rights of way, engineering and incidental expenses, is limited to $1,250,000. Payment will be made in city warrants drawn upon a special Cedar River Water Supply Fund, created for this purpose. Under the plan proposed by the council and ratified by the people, the city binds itself to set aside into the above named special fund seventy-five per cent of the gross receipts of the entire city water works after the addition of the gravity supply. This fund is to be applied solely for the payment of interest and principal of the warrants issued in payment for the supply plant. The warrants will bear five per rent interest, payable semi-annually, commencing from the date of completion and acceptance of the work, and after payment of interest at every semi-annual period the balance in the special fund is to be applied to redemption of the principal. The city irrevocably binds itself not to reduce the rates or charges for water, so that the seventy-five per cent of the gross revenues to be set aside shall not amount to less than at present, until the construction obligations shall have been fully liquidated and discharged; also not to sell, lease, or in any manner dispose of the city water works without providing for these obligations.

The water receipts for the year 1895 amount to $111,698.05, based on ten months' collections up to November 1st. During 1894 the receipts were $121,666.31, but as a flat reduction of fifteen per cent in water rates was made on July 1st, 1894, and another reduction of five per cent on January 1st, 1895, it will be seen that there has been an actual increase of five per cent in the business of the department for 1895 as compared to 1894. This is a most encouraging proof of progress in the face of the general depression. Estimating on a continuation of five per cent annual increase of business at the present water rates, the percentage agreed to be set aside into the Cedar River Water Supply Fund will be sufficient to pay all interest and redeem the principal of the warrants issued in payment for the gravity supply within twelve years from the time of completion.

This plan of payment for the proposed additions is simply the application of the surplus revenues of the water works to the improvement and perpetuation of the supply. Under the operation of the gravity supply the twenty-five per cent of the revenues retained by the city will be ample for operation and maintenance expenses. The possession of this abundant and economical supply will make it possible for the city to foster manufacturing and commercial enterprises by offering such inducements as water and power service, either free or at nominal rates. The supply controlled by the city will afford opportunity of developing power to the extent of 5000 H. P., as required, and a municipal lighting and power plant will be a natural consequence of the proposed water works additions. The method of construction and payment which has been adopted involves no increase of the bonded debt of the city, the interest and principal of which are payable from general taxation upon all assessed property of the city. The application of the surplus revenues of the water works to this special fund, instead of for general municipal expenses, will be more than offset by the saving of pump renewals, maintenance and operation, together with costs of street lighting. Thus, while the municipality will acquire and develop a permanent water supply, it is confidently expected that it will not involve even a temporary additional burden, while the eventual benefits are assured beyond all question.

Detail specifications, plans, forms of proposal and contract are now being prepared by the City Engineer, and the formal call for bids will be made in the near future. Alternative bids will be requested, covering both riveted steel and wood stave pipe construction.

# Scientific Progress.

### Difficult Engineering Feat.

A difficult and costly piece of engineering has been undertaken by the United States Government in the projected establishment of a great lighthouse in the open ocean off Diamond shoal, seven miles from the present Hatteras light, and bearing almost due east. This is one of the most daring schemes that army officers have dealt with since General Casey, chief of engineers, successfully undermined the great Washington monument, and placed there a solid foundation expected to support that structure for ages to come. Surrounding this new plan, however, there is foreboding of failure, and it is predicted this early that $1,000,000 is to be sunk literally as well as metaphorically in the sea. If such a structure is placed there, and stands without damage the onslaught of the sea for five years, according to a leading army engineer, this Government will have accomplished its greatest triumph in this branch of science.

The height of the focal plane above water in the prospectus will be just 100 feet, and the structure is to stand in 33 feet of water, and to be supported on disk plates sunk to a depth of 30 feet in the sand. The diameter from center to center of vertical members of the foundation series is to be 60 feet, and the height of the floor of the house above water 47 feet. The main portion of the structure is to be constructed of forged steel members with principal joints and connections formed of steel castings.

A special feature of the design is to make all essential parts below the water line of massive dimensions, as well as all those parts above the water line which will be subject to the action of wind and waves. The use of bolts, keys, screws and other small sections or dimensions, which would be rapidly weakened by corrosion, will be avoided as far as possible. Joints and connections are to be made absolutely rigid to all possible strains, and to be as strong as the members themselves. This is to be effected by joining ends of members to steel-cast hubs by the use of massive steel rings shrunk in a manner approximating that followed in "built-up" gun construction.

In the foundation series, besides the massive members necessary for the strength of the tower when in place, there will be certain other tie rods of lighter section, which are added for greater security to stiffen the framework while it is floated, and while being placed and grounded on the shoal It is proposed by the board to construct the screw pile structure in the harbor and float it out by steel cylindrical caissons calculated to give a draft of 30 feet when at sea. This part of the light is then to be sunk probably 50 feet down in the bottom by hydraulics until a firm hold is secured. It is then proposed to build up from the skeleton arrangement until the lightkeeper's apartments have been completed, and the height secured for the great lens, which is to throw its light 25 miles in all directions. The work is to begin this winter, and it is proposed to complete the lighthouse in two or three years.

### Electricity Direct from Coal.

I do not think many people have thought about the possible effects of a successful direct conversion of the energy of fuel into electrical energy. Different industries will be affected in different ways and to different extents. Some will be harmed; will be practically done away with; others will suffer indirectly; others again will be benefited. It is one of the conditions of evolution that with every advance there is some corresponding suffering. It is a struggle in which we are raised on some one's shoulders, and for an advance which would be so radical there would be many victims.

Let us consider for a moment the generation of electricity for distribution from central stations. In looking over the expense account of a company supplying energy, say, for lighting, we are struck by the fact that the cost of fuel is a small part of the total running expenses, and at first sight it would seem that a process giving us fifty per cent of the energy of the fuel would be no such great improvement over the present method, which gives, say, ten per cent. We would use less fuel, to be sure, but the cost of the fuel, as stated, is comparatively small. If, however, we considered the total cost of the energy at the switchboard terminals of the station, we can see that a simple process of direct conversion would make more than a small percentage difference in the cost. The generator would take the place of the boilers, engines and dynamos now in use. If the efficiency of our present plant is ten per cent, we are handling five times as much fuel, and our boilers are five times as large as they would be if the total efficiency were fifty per cent. If our direct method is comparable, say, to the generation of steam by a boiler, then, using it in place of our present system, would amount to changing our present plant—boilers, engines and dynamos—for a set of boilers one-fifth as large. There would be no high temperature, no moving parts, no commutators to wear out.—Dr. Louis Duncan in Cassier's Magazine for January.

### Coalless Cities.

The conditions of the great problem of entirely excluding coal from a city may be treated as follows: Artificial illumination, motive power, heating, cooking, manufacturing and various domestic operations, now performed with the aid of coal, must be accomplished without bringing coal or any objectionable substitute into the city. But how can such a radical and stupendous scheme be accomplished? The first reply to this, as to all other apparently unanswerable questions, would almost certainly be, "By electricity, of course."

If a suitable water power be available within a reasonable distance, it would naturally be utilized for driving the dynamos to generate electrical current for supplying a city. In the case of nearly all other large cities, however, the power would almost necessarily have to be obtained from coal, which would be brought to one or more large stations, located on the outskirts of, or at a sufficient distance from, the city, so that the latter would be free from smoke and other disagreeable consequences of coal combustion.

The current generated by the dynamos would be carried by overhead or underground conductors to the limits of the city, where the pressure would be reduced by step-down transformers from, say, about 10,000 volts to about 2500 volts in one or more stations, located at convenient points. The distribution of the current would be accomplished by running underground conductors from these main transformer stations to transformer substations, where the potential would be brought down to 250 volts for feeding lamps, motors, etc., by the three-wire system.

These sub-stations should be quite numerous, so that the local distribution at low pressure shall necessitate only the minimum weight of copper for the conductors.

A transformer sub-station could be in each block of the city, to be supplied with current. Local circuits from the secondary of the transformers would be carried around the block. These circuits would not be dangerous, since they would be operated at only 250 volts, and they could be strung as aerial wires supported upon fixtures or brackets attached to the roofs or back walls of the buildings, or they might be run in troughs, laid on the tops of the houses. Strong objections would probably be raised against allowing wires to be put up in this manner, but it should be remembered that they would be entirely out of sight from the streets, and would save the constant and very serious nuisance of digging up the latter for making connections to the individual houses. With overhead wires this could be done with trifling expense and trouble. All reasonable objections to these conductors are really less weighty than digging up the streets a single time to make or repair a house connection for gas or electric lighting.

The sub-stations would occupy only a part of the cellar in some building in each block, and there would not be sufficient noise or vibration from stationary or even rotary transformers to be at all perceptible in the rest of the building. The only precaution necessary would be the locking up of the transformers in a room accessible only to a regular attendant, who could take care of ten or more stations, visiting each occasionally to examine the apparatus, and perhaps also to regulate the voltage or to connect in circuit more transformers during the hours of heavy load. These last two operations could be performed electrically from a central station or automatically by clockwork, if desired.—Prof. F. B. Crocker in Cassier's Magazine for January.

# Mechanical Progress.

### The Life of the Present Steel Rail.

Referring to steel rails, Mr. J. F. Wallace, writing in the *Engineering Magazine* for December, says: While it is true that there has been a steady and uniform decrease in the price of steel during the last quarter of a century, the average standard weight of rail for main lines has at the same time increased from 60 to 99 pounds per yard, and the quality has materially depreciated. As an example of the deterioration that has taken place in quality, he states that during the past year he has relieved from a main track on tangents rails that weighed 75 pounds to the yard which had been in the track only five years; whereas, on the same district and under precisely the same traffic conditions, there still remain in the track 60-pound rails that have been in service for over fifteen years, which it was not considered necessary to renew this season. While this may be an exceptional case, he considers the steel rail which was furnished by the manufacturers fifteen to twenty years ago about 50 per cent better than the rail now manufactured. This is not intended to apply to special high class rails, which may be furnished by a few rolling mills under superior specifications, but to the ordinary rail supplied to and purchased by the majority of the railroads in the United States to-day.

### To Bore Glass.

Strong glass plates are bored through by means of rotating brass tubes of the necessary diameter, which are filled with water during boring. To the water there is added finely pulverized emery. The boring cylinder is put into motion by means of a drill or bow-drill. Weaker glass can be provided with holes in an easier manner by pressing a disk of wet clay upon the glass and making a hole through the clay of the width desired, so that the glass is laid bare here. Then molten lead is poured into the hole and lead and glass drop down at once. This method is based upon the quick, local heating of the glass, whereby it obtains a circular crack, the outline of which corresponds to the outline of the hole made in the clay. The cutting of glass tubes, cylinders, etc., in the factories is based upon the same principle.

### Machine vs. Intelligence.

The machine has run ahead of the human intelligence which operates it. A Western paper company, which has recently rebuilt a mill which was burned some months ago, has set up therein two Fourdrinier machines which, according to the contract entered into by the builder, are to run at the speed of 400 feet per minute. One of them was started up last week at a speed something less than that which the contract called for. The machine worked all right, but the attendants were not accustomed to such fast running, and it embarrassed them. It became necessary to slow down the machine, in order to allow the tenders to get acquainted with it. The 400-feet-a-minute machine has come to stay. And it is only two years since unbelieving foreigners were sure we were drawing the long bow, when we told them of machines in America that were running at the rate of 300 feet a minute.—The Paper Mill.

### Aluminum Solder.

The question is often asked, "Can aluminum be soldered?" The reply is that it can be soldered; but it is difficult to do, the principal reason for this being that it is with difficulty that solder can be made to adhere to aluminum, since the heat conductivity of aluminum is so great that as soon as the solder comes in contact with the metal the heat is conducted away from it so rapidly that the solder is chilled, and will thus not be allowed to flow freely on the surface of the aluminum. This can be overcome to a certain extent by keeping the sheet heated with an alcohol lamp or a gasoline torch while the soldering process is being carried on.

There are two general methods of soldering. One is to prepare the surface of the sheet chemically, so that the solder will form a chemical combination with the surface so prepared and adhere; and the second method is to plate with copper or some other metal the surface to be soldered, and then solder together these two surfaces.

The difficulty in this latter method is that, unless the plating is carried on with unusual care and skill, the plating itself will not adhere to the surfaces of the aluminum after a period of six or eight months, and the surfaces will drop apart, not from the fault of the solder, but from the fault of the plating.—J. C. McGuire before the N. A. M. E. Society.

### Edison's Experiments.

It is not the electric lights, nor the phonographs, nor any of the other things with which Mr. Edison's name is connected, that strikes the visitor to his workshops as the greatest part of his work. It is the invention of the innumerable machines with which these things are made. The idea of the electric light would have been of no use to the world without machines for making the lamps and the other parts. All of these machines had to be invented and made by the electrician, and there are thousands of them, some no bigger than a toy engine, some as large, nearly, as a house. Many of them are so delicate that they are operated with a belt no greater than a shoestring. One of them is used in polishing jewels for use in the phonograph. Without being touched by anybody it holds the tiny jewel in every possible position, shifting it, turning it, absolutely feeling it, to learn whether it is smooth, and all the while its delicate fingers are at work rubbing the jewel, which is no bigger than the head of a large pin. No boy could move his fingers more dexterously than this machine moves its parts in turning the jewel around.

THE latest invention in labor-saving machinery is the electric stevedore. This is a movable conveyor for loading a ship with flour or grain from an ordinary wharf. Its length is forty feet, two wheels in the center allowing it to be moved at will. The actuating power is electricity. The revolving belt on which the sacks are placed is of rubber, and passes over twelve rollers. It revolves at such speed as to carry all the weight in flour or grain that can be placed upon it. This apparatus recently loaded a steamer with 3000 tons of flour at the rate of seventy-five tons per hour.

# Electrical Progress.

### Why the Arc Light Hisses.

Prof. Sylvanus Thompson has been answering a question which has often puzzled the public. The arc light proceeds from the points of two little carbon rods as large as one's little finger. Prof. Thompson explains what is the state of the carbon when the lamp is throwing out its light. He says that the carbon is sometimes actually melting—a thing that was until recently thought impossible. Moreover, he says that when the light hisses the liquid carbon is really boiling. In ordinary combustion the state of the arc crater is such that the solid carbon below is covered with a layer or film of liquid carbon just boiling or evaporating off. When hissing takes place, a new state of things is set up. He says: "If you watch a short, hissing arc, you will see a column of light concentrating itself on a narrow spot, and the spot keeps moving about, and is very unstable in position, as well as in the amount of light it gives out. The crater surface, after the arc has been hissing, is found to be literally honeycombed. When the arc is hissing, you can see little bits erupted out and the hissing seems to be comparable to the hissing which takes place in boiling water."

### New Electrical Fields.

The power of electricity to do heating under every variety of conditions, to handle all varieties of the atoms of matter, and to operate as a chemical and physical agent directly in and through all parts of the living system, necessarily gives it an almost unlimited field. Not only can it supply light by heating to brilliant incandescence either carbon or platinum, but it can no less readily fill any demand for heating, or for cooking by means of heating. It, with great sureness and refinement of action, executes plating and electrotyping. Its immense and irresistible energy attacks with complete success the difficulties of smelting and of the reduction of refractory ores. It also comes to the help of the surgeon and the physician, on lines of medical efficiency almost coincident with those of creative energy.

In a recent suit brought against the city of Baltimore, Md., by the Safety Insulated Wire and Cable Company of New York city, it became of the greatest importance to have the wire company's charter in court. This phase of the case came up late one afternoon. Mr. Leonard F. Requa, general manager of the Safety Company, was in court. He knew that the company's original charter was in the president's safe-deposit box in New York and that the president was out of town. So there was no hope of securing the original in time to be of any service. After a few minutes' reflection, Mr. Requa went to a long-distance telephone and called up the Secretary of State at Albany, N. Y., to whom he explained the importance of the situation. The Secretary of State agreed to mail to Baltimore as soon as possible a copy of the Safety Company's charter. When Mr. Requa went down to breakfast in the hotel at Baltimore, the following morning he found a copy of his company's charter in his mail. This incident simply goes to show that when there is quick work on hand, a ready appreciation of the value of the telephone is a good thing to have with you.—Electrical Review.

Street cars are still rather expensive. The best cars, 35 to 42 feet in length, with modern fittings, cost from $2000 to $3000 in lots of ten to fifty. Single-truck electric cars, with electric equipment, from $1500 to $2500. Trailers for motor cars or for cable grips range in extremes from $750 to $1500. Cable grip cars, with gripping device, $450 to $1000. The electrical apparatus, which consists of two 30-horse power motors, the controllers on the platforms and the wiring of the car; also lightning arrester, switches, fuse box, etc., cost $900. A few months ago the price was $825. The same outfit, but less efficient, six or seven years ago cost $3500. A car wheel costs from $6 to $10, according to size and weight. Car axles, $4 to $5; window curtains from 75c to $3 each. Fare registers from $15 to $35 each; gongs from 75c to $2 each; trolley wheels 50c to 75c; trolley pole $1.50 to $3; hand brakes $5 to $50; air brakes $100 to $500; electric brake $25 to $150; head lights $4 to $12; car-heating stoves $5 to $25; electric heaters $4 to $10. The cable in the conduit, which pulls the cable cars, costs from 9c to 12c per foot. At present an electric track complete, with overhead work and feed lines and rails of 74 pounds to the yard, ranges from $3 to $3.30 per foot of single track.

It is believed, says *Electricity*, that the first electric light installed in an American theater was a Jablochkoff candle used as a focussing lamp in the old California Theater, on Bush street, San Francisco, in 1878. The managers of the theater at that time were Messrs. Barton Hill, General Barton and Frank Lawler. The play was "Antony and Cleopatra," Rose Eytinge and Cyril Searle taking the leading parts. Mr. A. H. Reese was the engineer in charge of the work. Seventeen years have worked a complete revolution in theatrical lighting, and to-day there is not a theater in the United States which could dispense with the electric light.

The metal glucinum is emerging from its position as a chemical rarity, and is coming to the front much as aluminum did some few years ago. It is even lighter than aluminum, which is remarkable, but its chief value consists in the fact that its electrical conductivity is as high as that of silver, and consequently higher than that of copper. It is less extensible than iron, and more durable. At present its value is 71s 4d per pound, which is prohibitive for large quantities; but this is only one-tenth of the price of platinum, weight for weight, and one one-hundred-and-sixtieth of the price of platinum, volume for volume.

To measure and record the time during which conversation goes on over a telephone wire between two people, an instrument has been invented called the calculagraph. It also registers the hour at which central is rung up, and any interruption in the conversation. The device consists essentially of a clock and printing apparatus, and will compute the charge at whatever rate it is adjusted for.

Elaborate and prolonged as were Edison's experiments with various forms of carbon for a lamp filament fifteen years ago, this line of research is still being followed up. Some recent German investigations suggest that an improvement on other materials may possibly be found in calcium carbide, the newly discovered compound from which acetylene gas is obtained.

It is customary, where a higher voltage than 2000 or 3000 is desired, to generate the current at about that potential, and then transform it by means of additional appliances. An alternating current dynamo has been built by Ferranti, in London, for the Deptford lighting station, which generates 12,500 volts. This is said to be without a precedent.

According to *Electric Power*, the microphone, telephone and phonograph are used by medical experts to collect and reproduce for students the different sounds produced by various human organs in a state of health and a state of disease. By means of a funnel these sounds can be magnified.

A German publication describes an electric system whereby iron furnaces in foundries can be charged, or filled, by cars operated from a distance, so that the men need not expose themselves to intense heat. Another advantage is that the work can be done in one-tenth the time.

The Cripple Creek Power and Mining Company has been organized for the purpose of generating and transmitting electric power. The generating plant is to be located at Florence and the power transmitted to the top of Gold hill.

The first of the great electric switch engines for the Baltimore tunnel was described in these columns last fall. The second one has been delivered, and is doing equally good work. The third is now ready.

# Practical Information.

### Burnt Steel—An Application of a Theory.

It is not always easy to make practical application of fine-spun theories, but that theory which is insusceptible of practical application cannot well be defended from the aspersion of fallacy.

Can we adapt and make familiar the theory that heat is a mode of motion and apply it to the known effects of overheating steel? Can we realize from our own personal experiences of burns and their physical effects upon our own systems that the exquisitely painful sensations produced are due to vibrations? When a hot coal sizzles on the flesh it is no time to philosophize; it is time to act, and when a piece of steel has become too hot, something has to be done with it immediately.

Heat is a mode of motion. Heat is motion. The property of attraction normally attaches to each atom of matter; it is not so necessary a part of it as to become essential to its existence as a primary atom, for it can be separated from it. In order to detach attraction from matter, sufficient motion must be set up. The condition of motion detaches attraction and the atoms separate. This motion in the case of burnt steel is set up by heat.

Attraction is rest. It is the tendency of particles to come together and rest upon each other. A body with its attractions satisfied is in equilibrium. Its forces balance. It is at rest. But heat is unrest. Heat gets among the particles of solid materials of steel, for instance—and they begin to repel each other. They have a greater fondness for going on an excursion than they have to nestle. When their motions acquire velocity enough they break their bonds, and the steel is no longer solid. It melts and is fluid. As the heat is excessively increased the particles of different elements of which it is composed make the discovery that they are free to separate. The carbon forsakes the iron, the impurities get away, finally the particles of iron themselves fly apart. It is not necessary to present to the solid steel any new substance for its constituents to unite with in order to dissolve the firm union of particles which gives it its characteristic solidarity, hardness and strength. It will just as well become fluid in a covered crucible if we can give its particles the vibrations due to temperature with equal facility. Get the heat to motion and the iron will go from a liquid to a gaseous state and to dissociation under the same conditions. This is no attenuated theory; it is a sad fact, as blacksmiths too often realize when they are unfortunately called away and leave their steel in the fire. At the slightest inception of heat the particles initiate movement. Take a close fitting plug-gauge in the hand, and the warmth imparted to it will set its particles into such motion that it expands and will no longer go into the ring-gauge which it perfectly fits when both are in equable temperature.

Put steel in the fire, and its particles at once in motion, unrest; at first their individual movements are fettered by the hardness of the steel, but the steel softens as they gain greater freedom, and by gradual increase their excursions become boundless, limitless, if the process is carried to the extreme and the steel is burned to gas.

Leaving this confinement to the forge, we may inject the remark that nowhere but in absolute zero of temperature can motion cease and stillness exist and rest endure. It is possible that in interstellar space, far, far away beyond any distance we can think, there may be such a region of rest, but that belongs to the category of things Huxley terms "unknowable." Singular as it appears to man, who has concluded that perpetual motion is unattainable, there is no space cognizable to man where all things are not in perpetual motion. At every point of space known to man perpetual motion exists. We know of no place impermeable to the influence of the sun.

Motion being heat, it is natural to trace it back in familiar paths to the sun, and thus find, at their headquarters, the elements of motion. This investigation might lead us to a more or less satisfactory conception of motion within the boundaries of our solar system. We may understand that motion is concentrated in coal, and comprehend Tyndall's saying: "Suns may revolve themselves into flora and fauna; and flora and fauna melt in air; the flux of power is still the same."

We return to the forge, and find that when flora and fauna are melted in air, we have a good, bright coal fire. You insert a piece of steel into its glowing heart, and it receives heat. The flux of power moves its particles and separates them. When it is quite hot, remove it from the fire, and if left to its natural conduct, when the heat is going away—or what is the same thing—when the heat motions are gradually ceasing, the separated particles will be left at the extreme boundaries of their excursions. As congellation progresses, they are fixed there, and are left so far apart that, when they get cold, they are only slightly within the sphere of cohesive attraction. That means that the steel is robbed of its strength. It will break like a pipe stem. It is burnt.

For this least injured form of burnt steel there is a perfect remedy, if its density can be restored. It may be treated in any manner which will bring to bear sufficient force of compression to compel the particles to come close together. This may be by hammering, by steady pressure, or by the contraction caused by shrinking the surfaces by rapid cooling, as by immersing it when hot in cold water. A worse form of burnt steel can only be remedied, or, as it is called, "restored," by chemical treatment. This is that form which has been exposed to the action of the air while its particles were widely separated by heat, inviting the embrace of the ever-grasping oxygen. A new element has come in; it will be found the piece is larger; every particle is enveloped with an oxide film. This film must be dissolved and removed before the particles of carbon alloyed iron can approach each other near enough to unite with the force of attraction which can only be exerted when they are in immediate contact.

I do not recommend anything for this. A treatment of cyanide of potassium, patiently continued, may, under certain conditions, produce some good results. A few immersions and coolings in rosin may produce on thin pieces a beneficial effect which puzzles the best steel workers. There are patented compounds which give good results.

It is of far greater importance to avoid than to remedy this error. One would hardly trust a barber who got ready to put a tourniquet around his neck if he should happen to cut his throat; so those who fix themselves with great care to "restore" burnt steel are hardly to be trusted to heat it. It looks like premeditated carelessness.

If by unavoidable accident a piece of steel gets too hot let the workman keep it out of the air, or else close up the grain by immersing it in cold water. Dip in and out, in such a manner

as to cool it as rapidly as possible without hardening it, or submitting it to a tension liable to create checks or promote cracks. Do not trust to immersion in soapsuds until the steel is below a red heat, for its effects are uncertain; it is apt to take hold in spots, cool unevenly and start cracks.

In any treatment of steel, where the temperature exceeds a hardening heat, let not the benign influence of borax be neglected. It is possible that the reason why no other substance has superseded borax as a flux for welding, is because borax is in every way so satisfactory that inquiry for a substitute lacks the motive power. It is good enough, and when steel is too hot there is nothing better to put upon it to render it impervious to the air and save it from the injury which might befall it if left exposed in its raw, bare and unprotected state. A flux of borax will varnish the surface of the too-highly heated metal and afford it adequate protection from the accumulation of further ills. It will also, to a considerable extent, prevent the formation of cold shuts and cracks in hammering for refining. It may be applied in powder either of (1) the raw borax; (2) borax roasted until it has parted with its water of crystallization, about forty-seven per cent of its weight; or (3) when it is burned to a glass. For the purpose of restoring burnt steel the powdered raw borax is probably the most efficient.

It is recently announced that a series of careful experiments has determined that if a trifle over one-half of one per cent of borax which is the metallic base of boracic acid is used as an alloy in steel, the tensile strength of the resulting metal will be greatly augmented without a proportionate increase in hardness and brittleness, sensitive to shock, when it is subjected to the operations of heating and rapid cooling as in hardening. It is said that the alloy can be filed, while common steel which acquired equal tenacity by hardening could not be filed. A skillful steel worker might, however, be able to perform these operations and produce opposite effects. Very much of the treatment of steel and its results depends upon the intention of them and who actually holds it in hand.—B. F. Spalding, in the Age of Steel.

---

DISCUSSION has again begun as to when the twentieth century will begin. Those who claim that it begins Jan. 1st, 1900, would probably decline to accept a payment of 1899 dollars from a wealthy debtor who owed them $1900. On Dec. 31st, 1900, the full term of 100 years comprising the century will have elapsed, and at midnight on that date begins another century—the twentieth, according to our little record. It would be interesting to know just how long man has been keeping an account of time. Several times since the world became inhabited an effort has been made to keep some sort of tally of the years, and after consecutive counting of the years for a few thousand of the earth's annual journeys round the sun the count has been broken, some great war or famine or catastrophe sweeping away all vestige of the record. Time and again the effort has been made. Of all chronologies the Chinese seems most definite and consecutive. They have an unbroken count of years amounting now to over 5000. About 1901 years ago a general understanding was had in Europe to date from the birth of Christ, and according to that nearly all those influenced by Western civilization count by that system, calling this year 1896, A. D., though, in comparison with older systems, 1896 looks very meager. Along in the coming centuries will doubtless ensue some cataclysm that will upset all the present chronology, and then in 2300, or 2700, or whatever it may happen to be, this A. D. system will be dropped and men will begin at 1 again, as they have so often done before in the circling cycles of Time's changing course.

ALUMINUM has been utilized for obtaining a flashlight as a substitute for magnesium. It is used as silver bronze.

## It Has Been Recently Held

A court of equity will not reform a written agreement when, by so doing, it would impose on one of the parties obligations which he never intended nor agreed to assume.

When an agent acts without or beyond the line of his authority, and the principal incurs thereby an injury, the agent may be held liable.

A promise by one party to do a given act, nothing having been done or paid in consideration therefor, cannot be enforced unless the opposite party either expressly or by necessary implication promises to do something in return.

The settlement of an action either begun or threatened, unless it be founded on a fraudulent or fictitious claim, is a valid consideration for promises by a third party to pay the claim.

It is the duty of a party to protect himself from the injurious consequences of the wrongful act of another, if he can do so by ordinary care and effort, and at moderate and reasonable expense; and for such reasonable exertion and expense in that behalf the wrongdoer is liable.

An employer is not bound to abandon the use of a particular machine or appliance, which is in common use, and in a proper state of repair, merely because there are other machines or appliances in use that are better adapted for doing the work, or that may be handled with greater safety.

In case the officers of a corporation authorized to issue share certificates fraudulently issue certificates for shares in excess of the number of shares the corporation is authorized to issue, the corporation is liable in damages for such overissue to an innocent holder for value of the overissued shares.

Where a party, having contracted to do a thing upon a given day, before the day of performance arrives repudiates his contract, or voluntarily puts it out of his power to perform, the other party to the contract may treat it as rescinded, and bring his action for the breach immediately and without awaiting the stipulated day.

## Colorado Miners' Wages.

The average daily wages of miners at the present time in the principal mining district of the State are as follows:

| *Counties.* | *Wage.* | *Hours.* |
|---|---|---|
| Clear Creek | $2 50 | 9 to 10 |
| Lake | 2 50-3 00 | 9 |
| Pitkin | 2 50 | 8 |
| Ouray | 2 50 | 10 |
| Hinsdale | 3 50 | 10 |
| El Paso | 3 00 | 8 |
| Boulder | 2 50 | 9 |
| San Miguel | 3 00 | 9 |
| Gilpin | 2 50 | 9 |
| Ward District, Boulder | 3 00 | 9 |

—Cripple Creek Mail.

## Gold and Silver Product of the United States in 1895.

Director of the Mint Preston has received approximate estimates of the gold and silver product of the United States in 1895 from the Mint officers and other agents employed to collect these statistics. The value of the gold and the number of fine ounces of silver produced by the several States and Territories is estimated to have been as follows:

| | *Gold, value.* | *Silver, fine ounces.* |
|---|---|---|
| Alaska | $ 1,500,000 | ..... |
| Arizona | 2,067,100 | 1,000,000 |
| California | 15,000,000 | 154,700 |
| Colorado | 15,000,000 | 22,000,000 |
| Idaho | 2,700,700 | 4,000,000 |
| Michigan | 40,000 | 35,000 |
| Montana | 4,332,700 | 14,700,000 |
| Nevada | 1,700,000 | 622,600 |
| New Mexico | 1,075,000 | 154,700 |
| Oregon | 2,300,000 | 7,700 |
| South Appalachian States | 316,300 | 1,200 |
| South Dakota | 4,255,000 | 82,200 |
| Texas | ..... | 206,000 |
| Utah | 1,352,300 | 8,223,000 |
| Washington | 300,000 | 11,600 |
| All others | 25,000 | 300 |
| Totals | $52,614,000 | 51,000,000 |

Director Preston thinks that the estimate for the gold product of Oregon is $600,000 too high; of Montana $250,000 too high; of South Dakota $400,000 too high; and that when the final figures are compiled, the production of gold by the mines of the United States in 1895 will be found to have been from $46,000,000 to $47,000,000 and the silver product about 47,000,000 fine ounces.

The product last year was $39,500,000 in gold and 49,500,000 fine ounces of silver.

**Hoskins' Patent Hydro-Carbon Blow-Pipe and Assay Furnaces.**

No dust. No ashes. Cheap, effective, economical, portable and automatic.

SEND FOR PRICE LIST TO

**W. HOSKINS,** 81 South Clark St., Room 51, CHICAGO, ILL.

**WANTED!**

**A COMPETENT ASSAYER AND ACCOUNTANT**

IS OPEN FOR ENGAGEMENT.

Situation in some California mine preferred.

Address ASSAYER,
Care MINING AND SCIENTIFIC PRESS, No. 220 Market street, San Francisco.

**Wanted—Position as Amalgamator.**

Have a practical knowledge of how to work all free milling gold rock. Fifteen years experience in Australia and California. T. L. ANDREW, Grass Valley, Nevada Co., Cal.

WANTED.—A FIRST-CLASS MINING BLACKsmith wants employment; can do lathe or machine work, build mining cars, understands Burleigh drills and compressor; good references. Address, CHARLES WILLIAMS, 420 Thirteenth street, Sacramento.

**"CRACK PROOF"**

326 California Street.

For the half year ending December 31, 1895, a dividend has been declared at the rate of four and twenty-six hundredths (4 26-100) per cent per annum on Term deposits, and three and fifty-five hundredths (3 55-100) per cent per annum on Ordinary deposits, free of taxes, payable on and after THURSDAY, January 2, 1896.

GEO. TOURNY, Secretary.

**INVENTORS, Take Notice!**

**L. PETERSON, MODEL MAKER,**

226 MARKET ST., N. E. Corner Front (Up Stairs), SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential*.

**FOR SALE.**

**A THIRTY-STAMP MILL AND A STEAM HOIST** Capable of sinking 1000 feet. Located at Drytown, Amador Co. W. S. WEYMOUTH, 19 Stevenson St., San Francisco.

# Mining Summary.

There are two ways to prospect and make money—one is to find a new camp of value, the other is to select a mineral district or belt whose worth has been proven, but whose area has not been thoroughly prospected, learn all its peculiarities and proceed to prospect it thoroughly. The ones who do the latter are the ones who, as a class, are the most successful. In the first place, anything that they discover is available, therefore finds a ready market. In the next place, they are not only nearer their base of supplies, but work, when they need work, is handier, and so they do not drift around so much and can easier stay by a prospect until its degree of value is learned. This drifting aimlessly around from place to place does not pay. It is usually a sign of incapacity and lack of application. Such a prospector will work a little while first rate, where it is soft, but just as soon as blasting ground is struck, he thinks of some prospect requiring his immediate attention in a distant part of the country, and departs accordingly. Nor does a prospector want to stay too long with a prospect. It often requires more moral courage to leave a prospect than it does to stay with it. Too many prospectors practically marry a worthless prospect and think more of it and slave more for it than they would of and for a wife. Their imaginations clothe it with a fictitious value and they excuse its bad conduct, if it is a ledge, by saying that the ore shoot is either a little below or else to the right or left; if it is gravel, by saying that the "bedrock is pitchin'." They give the same excuse year after year, and soon pass into the has-been state of existence. Talk about faith moving mountains! A prospector's faith, with a little giant, will blow up whole ranges. For usually, after he has worked a claim a while, his faith is as firm and unwavering as a martyr's.

## CALIFORNIA.

### Amador.

*Record:* At the Doyle mine they are putting up a water-power hoist, capable of going down over 500 feet, when sinking will be resumed. A crosscut has been run in another portion of the mine, which has encountered another ore body of a promising character.

At the Jackson Gate mine the shaft is down over 170 feet, in quartz all the way. The quartz is low grade—too low so far to justify working. The present shaft is for prospecting purposes, and will be carried down at least 400 feet. If the outlook then warrants, a permanent working shaft will be started at a point west of the present works. Nothing more than a low-grade proposition is looked for, being on the east or hanging-wall side of the mother lode. This vein, while lower in gold-bearing qualities than its western neighbor, is vastly larger and the precious metal is more evenly distributed through the quartz. The development of a paying mine here, therefore, promises a big labor employer for half a century to come.

B. Ross is making a new survey of the Bell Wether mine, belonging to S. W. Bright, which he lately bonded to G. W. Brown, who has interested capitalists of San Francisco to take hold of the property. The resurvey is made at the request of the new company, which assumed charge of the mine the first of the month according to agreement. Not much in the way of mining operations is looked for before the opening of spring.

### Calaveras.

A seven-foot lead of good ore has been struck in the 1000-foot level of the Gwin mine. The work of sinking the main shaft is now being driven steadily ahead.

The Birney mine, recently bonded to the Birney Mining Co., composed of J. F. Sheehan and other San Franciscans, has been reopened. There is about forty feet of water in the shaft, which will be removed by the skip. The work of sinking will be by contract. About eighty feet of drifts have already been run.

### El Dorado.

A ten-stamp is being moved by Supt. Beardsley from Plymouth, Amador county, to the Lady Emma mine, near Kelsey.

The Gold and Silver mine, south of Kelsey, has resumed operations, after a lapse of about sixteen years, under the direction of Supt. Knox.

Work at the Big Sandy is being pushed ahead. Grading for the new hoisting works is about completed.

(Special correspondence).—The Two Channel Mining Company started its ten-stamp mill January 2nd. It is ready to start its two hydraulic plants as soon as the ditch company can furnish water. These plants are on the Georgetown divide, and are owned by Pickett & Marmon of Indianapolis. Mr. Pickett is also manager and part owner of the Grand Victory, which is rapidly making a record as a regular bullion producer. A few more men like Mr. Pickett and the gentlemen whom he has induced to invest capital in El Dorado county, and who are associated with him—particularly Messrs. Wright and Marmon of Indianapolis—would soon show what great possibilities are in store for El Dorado county, when properly investigated.

Jas. Van Winkelen is developing the east extension of the Indian mine at Clarksville. His shaft has attained a depth of seventy-five feet. The ledge is exposed for 300 feet. The ore mills $8 per ton.

Development work on the Blue Gouge is progressing rapidly. The new tunnel is in sixty-five feet. It is rumored that Mackay and Head are interested in this work.

Additional machinery is being placed on the Gignac mine, which already operates a ten-stamp mill. This is a gravel mine, situated two miles east of here.

Jas. Patton is sinking a shaft on his ranch, six miles west of town. The ledge is five feet wide, and the ore prospects richly in free gold and sulphurets.

F. W. Beardslee is adding a ten-stamp mill to the Lady Emma plant. This mine is sufficiently developed to warrant the prediction that it is a permanent and paying property. It is located near Kelsey.

J. M. Vandegrift has completed a five-stamp mill on his property, ten miles south of here. The shaft is down 100 feet. The ore is rich in free gold.

Jos. Zimmerman, three miles north of Clarksville, is sinking a shaft and has reached a depth of ninety feet. The ore vein is growing, and mills $10 per ton.

### Inyo.

AT DEATH VALLEY.—Both mills, the Johnnie and Chispa, are running steadily, operated by a Salt Lake company, John Q. Cannon being its president. They are also operating the Confidence mine, which is situated on the western slope of the Funeral mountains in Death valley. These seem to be the most difficult and expensive mines to work in the country, owing to the scarcity of fuel and water principally, but freighting from Daggett is equally as arduous a task. A mill is now upon the ground and will be hastily constructed, and run by gasoline, the same as at Montgomery. There are no accommodations to be had; everybody is camped in the open air, as it seldom rains. In that isolated spot men are camped at springs awaiting a chance to get employment.

### Kern.

AMALIE MINING DISTRICT.—(Special correspondence). One year ago there was but one prospect on which work was being rapidly pushed, that being the Amalie, which had been opened up to a depth of 100 feet, at which point ruby silver had been struck. During the past year this property has produced some of the richest ore of southern California, and is to-day the only ruby silver producing mine in this State. Work has been pushed forward till at present the mine is opened up to the 300-foot level, with drifts run every 50 feet. A good hoist has been erected and perfect ventilation secured by a system of winzes and air courses, and the mine is now in the best possible condition for further development, the ore having increased in richness from the grass roots.

The company has also erected a new boarding house, with a large cellar; a good store, with a large stone cellar; an ore house; a blacksmith shop; barn, and several dwellings for the use of employees; added two Frue concentrators to its mill and otherwise improved their facilities for general operation, and to-day have one of the best properties of its kind on the coast.

The Occidental company, which began its work here about a year ago, has done about 900 feet of sinking, drifting and tunneling and have now in sight some good ore and has both worked and shipped ore which proved very satisfactory.

Within the past year the Amalie mining district was formed with laws for the regulation of assessment and location work which require ten feet of work, with all monuments up before the notices can be recorded, and one hundred dollars' worth of work on each and every claim for each year, an affidavit of which must be filed with the District Recorder. The district was formed April 13. Since that time there have been recorded 22 locations on which the required amount of work was done, prominent among these was the Picnic, from which was taken $400 in the first 40 feet, it being practically free-milling gold ore. The slate wall, from which there has never been a mill test made but shows considerable free gold, carries sulphurets heavily. Messrs. Young, Sauser & Co. have also discovered and located some mines on the Piute and are showing some handsome gold specimens which they have taken out, their lead being from 12 to 16 inches in width.

One year ago we had no mail service. To-day we have a postoffice and a stage line running through camp to Piute, making three round trips each week.

Our district is well watered and wooded; is 15 miles from the railroad by the county road; has an elevation of 3000 feet, and a climate almost perfect. All in all, we consider the past year a very prosperous one for this section, and it is to be hoped that its progress will be unabating in years to come.

### Nevada.

THE CHAMPION'S NEW MILL.—*Transcript:* The balance of the machinery for the Champion Mining Company's new forty-stamp mill has arrived and is now being hauled to the site of the mill. As yet the framework of the mill building is only partly up, but the timbers are all framed and the millwrights are hurrying the work of getting them up in place. The work of placing the machinery will begin soon. When the mill is completed it will be one of the best in the State and, with the thirty stamps that are now dropping, will give a large crushing capacity.

THE PLUMBAGO MINE. — *Transcript:* The main tunnel at the Plumbago mine, near Moore's Flat, is now in 600 feet, and an upraise of 350 feet has been made to the surface. The last hundred feet in the tunnel has cut a new ore shoot not seen on the surface or known of before. The ledge is seven feet wide, of good ore, which mills, exclusive of the sulphurets, $5 per ton. Supt. Taylor is well pleased with the outlook. The tunnel will reach the old shoot that was worked years ago, the quartz from which paid as high as $80 per ton.

TO WORK GRAVEL MINES.—A well posted mining man suggests to the *Transcript* that many gravel claims in Nevada county that in years past were worked by the hydraulic process, could by made to pay well by drifting and having a mill to crush the gravel. At the Harmony drift mine, near Nevada, a ten-stamp mill is kept in operation steadily and crushes 120 tons of gravel per day, at a total cost of less than $3000 per month, which includes wear and tear of mill, water power, screens, quicksilver and labor. It actually costs only thirteen cents per ton to work the gravel, a No. 12 screen being used in the battery. With a twenty-stamp mill it would cost, to work 240 tons, less than nine cents a ton. This is cheaper and better, it is claimed, than hydraulic mining, and would suggest the opening up and working in this manner of more gravel mines throughout the county, which are so situated that the building of impounding dams for hydraulicking would be hardly practicable.

STILL CONTINUES RICH.—*Union:* The big strike made at the Neversweat mine, in Willow valley, Monday, still continues. Another large amount was taken out Tuesday, and from the character of the quartz it looks as though there is a big mine out there. A piece of ore weighing 300 pounds and covered with gold was taken out Tuesday.

### San Diego.

AT JULIAN.—The Elevada mine has 120 tons of ore at the mill. The mine is worked by an incline shaft, which is now down 101 feet.

### Shasta.

ILER BROTHERS' MINES. — *Free Press:* Iler brothers, on the Iron Mountain range near Slick Rock, own Mountain View Consolidated, Bunker Hill, Jupiter, Mountain View No. 2, Comet and Yellow Jacket. They have opened up during the past five years a large body of ore that will yield at least $8 per ton. Their first tunnel was commenced on the Bunker Hill, and run in on the Mountain View, and is now 495 feet in length, showing a four foot and a half ledge which is tapped 380 feet from the surface or apex of the mountain. It is estimated that 30,000 tons of ore are ready to be stoped. Their second tunnel or level is on the Bunker Hill claim and was started directly under tunnel No. 1 and 200 feet below. It is in the mountain side almost 500 feet and taps the ledge 600 feet deep. This tunnel goes through an ore body forty feet thick, and the ledge in the breast of the tunnel is six feet wide. The ledge seems to widen out and the ore get richer as depth is attained, and contains more free gold.

AT SUNNY HILL.—The mining industry of Sunny Hill is not in a condition of activity. The causes for this are the same as those from which many mining camps on this coast (and indeed in all mining countries) have lain idle for a long period and then become inactive. As to mineral and ledges, there are an abundance. But mining here has been done in a small and cheap way. Numerous little arrastras have been erected, the surface scratched through, the surface pockets taken out and the property then abandoned. Only one or two mines have been mined with any system by miners, and, although work done on them has been only surface mining, they have paid well. No ledge in this district has been tapped by a tunnel at any depth, and no shafts of any consequence have ever been sunk. To add to the difficulties of the "little" miner, only a small proportion of the gold carried by this ore is free.

In addition to the vast quantities of ore in this immediate vicinity, there are ledges and ledges almost without number, all the way up to Bully Choop, and the ore composing them is of all degrees of promise and richness.

We have ore in almost inexhaustible quantities, property at low prices, climate that permits of work twelve months in the year, and water and wood in plenty for any kind of reduction works the year round.

What we stand most in need of is reduction works to reduce the ore of a lower grade than the heavy cost will warrant shipping to the bay. With such a plant work would begin on almost every ledge from Bully Choop to Ono, and this would instantly become one of the busiest, bustling mining camps in California.

AT IGO.—The mines in and around Igo are looking up well, and the mining outlook of this camp for the coming year is exceedingly promising.

Our mine owners are now working their yearly assessment on their mines.

A good many men are at work on the old Hardscrabble mine drifting.

E. L. Ballou has been running his mill on ore from some of his mines at South Fork.

Many miners are anxiously waiting for the rain to come so as to start up their mines, which are all in readiness to be worked.

THE NEW WORKS AT KESWICK.—In a descriptive article on the Mountain Mines Co. at Keswick the *Free Press* says the power house contains a large steam boiler and engine and the dynamos for arc and incandescent electric lights, and for the generating of power for the machine shops, rock breakers and smelter. Electricity will be the only motive power used. A spur three-rail track runs down past the power house, and across this track from the house are the two rock breakers, each one in its own house. Up the track a distance of eighty yards is situated two large two-story buildings, which are about completed. They are on the left of the track. The first one reached is being fitted for a store on the ground floor. The upper story will be occupied as an assay office. A platform connects this building with the second one, the ground floor of which is used as a warehouse. The upper floor will be used for the offices of the company.

Across the track from the warehouse is the high trestle for the spur track, which will carry the cars loaded with ore to the smelter.

Beyond this track is a large frame building occupied as a machine shop. Across the creek is the main line of the Iron Mountain Railway, which runs from Keswick station on the Southern Pacific Railroad to Iron Mountain. At the end of the high trestle heretofore mentioned, and directly opposite the power house, is situated the smelter. One brick furnace is completed and one iron retort is in place. The furnace and retort are under a roof of iron, which is surmounted by ventilators and from which extends the large iron smokestack.

The fire was started in the furnace last week. The grading of the railroad is almost completed.

The last camp, No. 3, was abandoned last week and the company now starts to haul ore from Iron Mountain to Keswick over their own railroad.

### Siskiyou.

MINING NOTES. — *Journal:* The Success mine, which for some time past has been worked by the Scheld Bros. under a lease from Sophia Lee, has been closed down for more than a week. The Scheld Bros. assigned the license to Henshaw Bros., who advertised for new machinery and stated they intended to develop the mine on an extensive scale. After working a few weeks the managers became involved in a misunderstanding with the men working for them, as the wages were not paid as agreed upon. The lease was taken again by Scheld and the mine will now be worked under the management of John Burgess, and it is expected that it will do well, as it has proved by past results that it is a good property.

The Blue Gravel mine, at Greenhorn, was compelled to close down last Friday owing to the water supply having become exhausted. The tracks in the mine have all been relaid and the mine put in first-class shape. Work will be resumed as soon as there is sufficient water.

The Chinese employed in the Benz Bar claim, near Honolulu, are still working steadily day and night, notwithstanding the cold weather, which has caused temporary stoppages by freezing up the water in the flumes, and rendering the current wheels so heavy with icicles as to be difficult for turning, especially during the nights. The company has felt so elated over the success of digging out $1800 from a small crevice a few days ago, that it is anxious to keep things moving as long as possible before winter freshets come, when a heavy thaw or rain storm occurs.

The Chinese Company, above the mouth of Humbug creek, on Klamath river, has shut down on account of the cold weather, and nearly all the other claims, from Cottonwood to Scott river and Hamburg Bar, have also been shut down for the season.

The Steamboat mine on McAdams has been compelled to close down for a short time owing to the impossibility of getting dry wood to keep the pumps in operation. The engineer says they have used all the dry wood within six miles of the mine and kept the pumps going for a while by using green wood. Brokaw & Bennet will commence work again early in the spring. Great progress has been made towards developing this property since it came under the present management and since the new machinery was introduced last summer.

Work on the Espey, Hunter & Co. mine at Hawkinsville was resumed last Friday after having been suspended for over two weeks, owing to a break in the pumping machinery at Shasta river. The pump has been temporarily repaired to await a casting from Pittsburg, where the pumps were built, to repair the broken part.

*Journal:* The Seattle Placer Mining Company, which recently purchased the Shinar mine on Thompson creek, is making extensive improvements.

Around Scott Bar the Columbia and Gum Boot mines will both be worked this spring.

The old Bunker Hill mine near Happy Camp will be developed by Hughes & Hilbert, the new owners, who recently purchased it for $10,000, upon a more extensive scale.

The Steamboat mine on McAdams creek is being worked on a very extensive scale.

The mines on Salmon river are all very rich, and the new and extensive plant put in by the American Mine Association and Gold Ball Mining Company will enable the owners of the Gold Ball mine to work that property to great advantage.

The Espey, Hunter & Co. mine at Shasta river, the Blue Gravel and Success mines at Greenhorn and a number in Long gulch are expected to make a good showing next summer and make Yreka lively.

Scheld & Steele are busy at their mine on Long gulch, and will start their new arrastra up in a few days, crushing ore. The arrastra will be run by horse power at present, but the owners expect it will be necessary to put in an engine in a short time.

Very few of the small mines have been able to do much yet, owing to the scarcity of water; but now that the snow has begun to thaw, a plentiful supply of water will be obtainable.

The mines owned by Billups, Quigley and Humphreys, on Barkhouse creek, have been closed down for this season, but will be started up early in the spring.

The force at the Blue Gravel mine is at work still, but is not able to do much until it gets a better supply of water.

The Espey, Hunter & Co. mine at Hawkinsville is still shut down, the break in the large pumps at Shasta river not having been repaired yet. It will be some time before the casting will arrive to replace the broken part.

The Success mine, which the Henshaw Bros. have been working under a lease, has been closed down for several days past. Henshaw Bros. have given up the lease, and the mine will now be worked as before, under the management of John Burgess.

### Trinity.

*Journal:* As yet the output of bullion is greater from the placers than from quartz, but the ratio of difference in production is lessening yearly. The chief placer mines are situated at Junction City, Trinity Center, Coffee Creek, Weaverville, Minersville and along the Trinity river. During the past three years about $1,000,000 of French capital has been invested in the placers of the county. The La Grange Hydraulic Gold Mining Company, the Cie Fse Placers Hydraulique de

Junction City, the Minersville Hydraulic Gold Mining Company and Francis Heurtevant have purchased valuable gravel mines and equipped them with the latest and most improved appliances, giving employment to a large number of men. They are working these properties on a larger scale than before attempted here. The other developed gravel mines are regular in their production of bullion, and many age rich, yielding from $7000 to $25,000 to the acre.

There are also vast banks of gold-bearing gravel as yet unworked, owing to their situation and the expense of bringing water to them. It is only a question of time when these will be made productive. Another method of mining placer deposits is now being tried which, if successful, will revolutionize the industry. An elevating machine has been placed on the Trinity river this fall and is now being prepared for working. The machine works on the principle of a dredger and, it is claimed, will lift 3000 cubic yards of gravel a day to tram cars, which carry it to sluices for washing.

It is only since about 1880 that quartz mining has been carried on successfully in this county, but it has advanced rapidly. The principal quartz camps are Deadwood (in which is situated the famous Brown Bear mine that has produced millions), Trinity Center, Bullychoop, Canyon Creek, East Fork, New River and Minersville. The county contains besides a vast unexplored mineral belt ribbed with precious gold-bearing ledges.

One of the most valuable quicksilver deposits in the United States is located at Cinnabar. One mine, the Altoona, employs over 100 men and yields on an average 700 flasks of quicksilver a month.

In addition to these valuable metals there are large deposits of marble, granite, asbestos, soapstone and hydraulic lime, only requiring cheaper transportation to become valuable.

### Tuolumne.

MINING NOTES.—"Argus" in *Independent*: The Golden Rule, Jumper and Rawhide mines are taking out rich ore.

The Belleview cleaned up their ten-stamp mill, this week, after a successful run on good ore.

The Seminole have started up their mill and expect to keep it continuously running.

The Keltz mill has been cleaned up after a good run.

The main shaft of the App is being straightened and faulty surveys are being corrected. These mistakes have retarded operating this property considerably.

The mills of the Jumper and Golden Rule are running steadily. We were shown a very handsome and valuable specimen of gold in dyke formation from the Golden Rule.

A little mine on the east side of the North Fork of the Tuolumne is being prospected with very favorable results. It is a large vein and almost a high-grade proposition. Arrastras are being built to more thoroughly test the ore. It is well situated for extensive mining.

The Star mine is taking out fine ore. They sent the base and sulphuretted ore, worth several hundred dollars per ton, to San Francisco, for special treatment, while the free-milling ore, worth about $25 per ton, is crushed in the ten-stamp mill on the ground.

The old shaft and drifts of the Louisiana are all cleaned out and prospects look well for a rich paying mine.

The Spring Gulch mine, belonging to Marshall, is bonded to Essenberger & Andrews, of Salt Lake City, who propose to equip it and develop it right away.

The Crystalline group of mines, on the mother lode, are busily engaged in putting up a new hoist on the large vein, which shows free gold to the eye.

*Banner*: At the Teeters mine, on the north fork of the Tuolumne, five miles east of the Confidence, there has been little or no prospect work done on the claim, yet the natural development shows a vein that averages twelve feet and the assay gives from $5 to $7 in free gold and from $50 upward in sulphurets. All that is necessary to make a paying property out of the mine is capital. Sufficient free water can be obtained the year round to run a forty-stamp mill.

The Reno *Gazette* hears on good authority that the sale of the Silver Star mines is made. James Yerington, who has the deal in charge, has received a telegram from an English company, some of the members of which are in San Francisco, telling him to come to this city. The telegram said the company would accept the mines on the approval of ex-Governor Colcord. As to the approval of Mr. Colcord, that gentleman has already given it as his opinion that the mines are a valuable property and all they lack is capital to open them up. The mines included in the deal are the same lot that were in the Wolcott sale, with the exception of the Brown mine.

### STOREY COUNTY.

The plant of the Kinkead Mining, Milling and Manufacturing Co., at the foot of the C. &. C dump, has started up. The mill is to work over the waste from the C. & C. mine. Most of the machinery is the invention of J. H. Kinkead, the president of the company.

## OREGON.

### JACKSON COUNTY.

M. A. Graham of San Francisco has bonded the entire Golden Fleece mining property, with the exception of the Edna quartz mine, which Messrs. Moody, Saltmarsh and Boland will continue to work. The property bonded by Mr. Graham comprises 269 acres. He will begin extensive operations at once and intends to erect thereon a milling plant which will work from 100 to 300 tons of rock every twenty-four hours.

At the Ruble placer mines, on Coyote creek, three giants are at work. Some sliding has interfered with the working of the ditch.

Chas. Hocom reports having struck a nineteen-inch vein of good paying quartz, carrying free gold, on Neil creek, about two miles south of the railroad.

### JOSEPHINE COUNTY.

The Gold Basin project will employ some 200 men next season. A ditch twenty miles long is projected, tapping the headwaters of Chetco. The present ditch, three miles in length, will bring a good deal of rich dirt under the monitors without the aid of pumping works.

### BAKER COUNTY.

During '95, in the Virtue district, several new discoveries have been made of free-gold quartz lodes. The Virtue mine has eighty men, and has yielded $17,000 per month. The last strike of two small pockets turned out $44,000. The shaft is being sunk for the opening of levels deeper on the vein. At Cracker creek the Longmaids, experienced mining men, have the "E. & E." mine and mill under lease and bond, and are concentrating the ores of that property for shipment to the Tacoma smelter. Their shipments the past year have averaged about two carloads of concentrates per week, of the approximate value of $135 per ton. They employ thirty-five to forty men in the mill and mine. Preparations are being made to double the capacity of the mill by adding twenty more stamps. At Cable Cove a Utah company is developing a group of claims under lease and bond, and on June 1st are to determine whether they will go on and put up a thirty-ton capacity concentrating mill or not.

Eastern Oregon miners are specially favored by the O. R. & N. Co. in a $5.50 rate on ore.

## WASHINGTON.

The Yakima *Times* reports the discovery of a large body of tripolite near Roza, about twelve miles from Yakima. The discoverer says the deposit is about 200 feet in thickness. A sample of about 150 pounds was brought down.

### OKANOGAN COUNTY.

E. P. Wheeler, of the Bridgeport Mining and Milling Company, tells the Spokane *Spokesman-Review* matters of interest in Okanogan county.

Their properties on Mineral hill are fully equipped with machinery, and everything is on the ground to go ahead with work early in the spring. "On one of the properties comprising the group, we have sunk a shaft 130 feet deep and have drifted 400 feet south on the vein. Our preparations are now complete to run a crosscut tunnel from the bottom of the shaft 1000 feet into Mineral hill. When completed it will give a vertical depth of 750 feet on the vein. The ledge is 80 feet wide on the surface, carrying silver, with a trace of gold. At depth the character of the ore is changing and the ore now carries $16 to $32 in gold. It resembles telluride ore. To get the product out costs $40 for freight and treatment."

The Bridgeport Mining and Milling Company in Okanogan county has let a contract for the cutting of 5000 cords of wood and burning 1000 bushels of coal. The company recently suspended operations but with the intention of resuming again next spring.

### MONTE CRISTO.

Development work in the Seventy-Five mine, in the Monte Cristo district, has been suspended for the winter, owing to the failure of the water supply with which the air machine was to be run. The Pelton waterwheel and ventilating fan have been set up and a box flume built to convey the air from high up on "76" peak, but the water had frozen up, so work had to be stopped.

The work of stringing the 5000 feet of heavy insulated copper, aerial cable, which will connect the big electrical generator at the Union Concentration Company's concentrator and the Burleigh rock drills in the Pride of the Mountain mine, in Monte Cristo, is nearly completed. When the electric drills are started up the output of the mine will be greatly increased.

### EVERETT.

The iron ore tests made at the Everett smelter last week have proved very satisfactory. The ore was from the mines near Hamilton, where a number of men are now at work getting out ore and opening up the vein. It is said that shipments at the rate of ten carloads per day will soon begin from this mine to the Puget sound reduction works at Everett.

Mackintosh Brothers, who are largely interested in the Goat lake district have shipped a car of ore from one of their promising properties near Monte Cristo. The ore was shipped to Chicago to test a new cyanide process of reduction. If it proves satisfactory they will erect a plant there.

## BRITISH COLUMBIA.

THE HORSEFLY COMPANY.—One hundred thousand pounds of Ward pipe is now on its way to the 150. The riveters will be in about February 1st, and the work on the Horsefly company's ground will be pushed, and the hydraulic elevator put in under the direction of its inventor and patentee, R. C. Campbell, at as early a date as possible.

THE MONTREAL COMPANY.—At the Montreal claims on Quesnelle river, near Beaver, Superintendent Drummond has the cross-drift in to rim rock. 1700 feet in the upper benches; good gravel was found all the way. Shafts have been sunk at various places in the course of the drift. Some rich ground has been found, and the company as a whole are well satisfied. It is expected that a large force of men will be put on early in the spring and work in earnest commenced in the way of building dam, ditch, etc. The dam will be either made of cement or of logs and gravel. It will be 50 feet in height and the ditch line will be about 14 miles long. An immense ditch will have to be constructed to supply water enough, as the company calculates on running half a dozen monitors. The cost of opening up this property will be a quarter of a million dollars.

## ALASKA.

THE BOUNDARY QUESTION.—General Duffield, chief coast and geodetic survey, has presented to the Secretary of State the joint report on the Alaskan boundary recently agreed upon by him and the Canadian representative, Mr. King. The report will probably not be made public until it is transmitted to Congress, but it shows a practical agreement between the surveys of the two Governments, and may have the effect of partially quieting the apprehension of trouble over the boundary. The greatest difference between the lines run by the engineers of the two Governments is but six feet seven inches, or fifteen seconds of longitude. In the view of the two surveys, General Duffield does not hesitate to express the opinion that there can be no difficulty between the United States and Canada over the boundary. He said: "The line is as clear in the treaty as though it had been recorded by deed and map." General Duffield is confident that the British can find no grounds upon which to base a claim to the gold fields of the Yukon river, since a British engineer, Oglesby, in 1893, after a very careful observation, marked the banks of the Yukon and Forty Mile creek, where these streams are crossed by the 141st meridian, and his marks were verified by the United States survey. The only possible ground for contention which General Duffield foresees is furnished by that phrase of the Russian-British treaty that at no point shall the boundary be more than ten marine leagues from the shore. The United States Government interprets this to mean continental leagues, while England might contend that ten leagues from the island shore was contemplated, a construction which would deprive the United States of a valuable strip of territory, if sustained.

EBNER GOLD MINING CO.—The Ebner Gold Mining Co., incorporated under the laws of the State of Oregon, has filed articles of incorporation in Sitka; capital stock, $500,000; W. E. Ebner being president, C. W. Young vice-president, B. M. Behrends secretary and treasurer. Its term of existence is placed at ninety-nine years and the principal place of business at Juneau. The company has acquired by purchase the Takou group of mines, mill, trams, etc., recently sold to Mr. Ebler by W. Thorp. The new company will begin operations next spring.

## IDAHO.

A FLOATING GOLD MINE CAMP.—E. H. Lewis is about to launch a boat on Snake river that will be a veritable floating mining camp. There is a stationary engine and boiler which weigh 24,000 pounds, dredges, cranes and pumps of all sizes and descriptions. On the boat is a good boarding and lodging house intended to accommodate 50 miners. This mechanical battery will move up and down Snake river, working the channel and banks for gold. The scheme was tried on a small scale before and proved successful. The launching takes place at Froman's Ferry, about fifteen miles from Caldwell.

THE FORTUNA.—*Statesman*: The Fortuna Mining Company has designated T. H. Parsons of Hailey as its local agent. The company was recently incorporated under the laws of New Jersey and has purchased the Camas No. 2, near Hailey, for $250,000, and has begun active operations on the property.

THE POORMAN.—A. Grothe, manager of the Poorman mine at Silver City, has returned from London and will start up work on the property. Some weeks ago the workmen unexpectedly came upon old stopes and in a rush of water a man was killed. This was a serious matter, but in a business sense it was also serious, for it showed that the great ore chute that made the mine famous had been worked down to or near level of the new tunnel recently run.

The maps of the old workings showed 200 feet of virgin ground above the tunnel level and the company had relied upon their accuracy. The question that next arose was that whether the company desired to face the expense of development below the tunnel level. Mr. Grothe went to London and he comes back with authority to proceed. The mine will be furnished with an electric pump and hoist.

IN THE COEUR D'ALENES.—*Spokesman-Review*: The product of the Last Chance mine has for the past four months been averaging about 400 tons a month. It is hoped by the manager that the mine will be able to put out 1000 tons a month during the next six months; this in crude ore and concentrates. Improvements are being made to the mill which will double in capacity. One hundred men are now employed and when the improvements are finished more men will be employed. The mine is looking well and barring accidents work will go right on.

The Bunker Hill and Sullivan are working right along with about 350 men and are turning out seventy-five to eighty tons of concentrates daily.

The other mines in the district are all working and the product for the coming year will exceed the output of all previous years.

## MONTANA.

The gold excitement at Moose lake, sixteen miles from Philipsburg, Mont., has a good foundation. The vein discovered there has the merit, it is said, of not only being rich, but of great proportions. Twenty-eight miles west of Philipsburg, and fourteen miles from Bonita station, on the Northern Pacific, is located the Golden Scepter Mining Company on Harvey creek. This company is working in an extensive body of ore that averages $8.70 to the ton.

THE SNOWSHOE.—At the Snowshoe, seventeen miles from Libby, fifty men are at work on the concentrator and in the mine. The concentrator will be completed by January 15th and will have a capacity of 125 tons. The concentrates will be hauled by wagon to the railroad. The Snowshoe group is 160 miles from Spokane, Wash., and seventeen miles from the line of the Great Northern railway at Libby, Flathead county, Mont. About a year ago the Chicago & Montana Mining Company bought it, and since May '95 have made many improvements and spent $50,000.

CLAIM JUMPERS AT CAMP CREEK.—The claim jumpers had a merry time around Camp Creek as well as in Butte Tuesday night and the bleak hills from Soap Gulch to the Clipper saw more excitement that night than it has seen for some years. Several parties from Butte went out and among them a married lady who followed the lead of a couple of sturdy miners. A visitor from that section to-day says that every mining claim in the district is plastered with location notices, as many as four different declaratory statements being stuck up on the same claim.

BUTTE MEN JUBILANT.—*Inter-Mountain*: Butte stockholders in the Poorman in the Coeur d'Alenes and the War Eagle at Trail Creek are feeling good this week over the favorable reports from both those properties. Since the consolidation of the Tiger and Poorman properties and consequent reduction of expenses, things are looking favorable for the stockholders. Extensive and important improvements and changes in the mills and hoists are nearly completed after which it is expected that the mills will have a capacity of turning out from 1,700 to 2,000 tons of concentrates per month. With this output the owners expect to net about $25,000 monthly at the present metal quotations. They have cut the vein at the eleventh or 920-foot level, which shows a seven-foot body of ore, three feet of which is first class and showing a slight improvement in the ratio of silver to the unit of lead which will tend to increase the value of the concentrates without increasing the expenses of production. The property is looking as well as any of the stockholders could wish and the prospects are bright for the payment of dividends in the near future.

The new air compressor at the War Eagle in on the ground and will be running by Feb. 20. In tunnel No. 1, which is 250 feet from the surface the "big bonanza," as the rich chute of ore is called, from which about $250,000 has been taken—was struck some days ago. Tunnel No. 3 has been started 500 feet from the surface and in this another rich vein about three feet wide has been encountered, which gives a higher percentage of copper than the other lead and assays about the same in gold. This tunnel will be rut in about 1800 feet to get under the big ore body in tunnel No. 2.

## WYOMING.

There are no smelters in Wyoming; deposits of gold dust in the United States mint from this State are not reported to others than the depositors. The past year has been marked in all parts of the State by a renewal of interest in gold mining. Prospecting done during the earlier part of last year resulted in the investment of considerable capital in at least three important districts in the State. In one of these districts, known as the Four Mile mining district, and situated partly in Colorado and partly in Wyoming along the State line south of Rawlins, the West Side Placer Mining Company of Providence, Rhode Island, invested upwards of $100,000 in the work of putting in canals, hydraulic mining machinery and gold-saving apparatus. This work is just being completed, and the company is now in shape to commence washing.

Similar enterprise is to be found in the Douglas Creek mining district, south and west of Laramie. Several companies of comparatively large means have built canals and put in hydraulic machinery, and are prepared to commence work early this year washing for gold. The past year has been spent mainly in prospecting and in preparing for the work of 1896, but with this there has been considerable gold taken out, enough, it is thought, to cover all the expenses of prospecting and of dead work.

Operations have also been active in the Bald Mountain district, which is tributary to Sheridan. The milling capacity of this district has been doubled.

The hopes of Wyoming mining men are centered upon the improved methods which are being discovered, of saving fine gold from placer washings and of methods of cheaply treating low-grade gold ores.

The suits brought against the Rocky Mountain Coal Company of Uinta county, by the heirs of the sixty miners killed at the Red Canyon disaster of last spring have been compromised. The coal company agrees to pay each of the sixty plaintiffs $1000. The suits against the company which were to have been tried in the Cheyenne court January 13th have been dismissed.

## SOUTH DAKOTA.

*Pioneer*: Thomas Tracy, who owns a two-thirds interest in the Cutty Sark mine, says the Kidd concentrators in the Cutty Sark mill are proving insufficient, and the management is going to supplant them with a Frue vanner. Tests made upon the tailings showed that $3.60 was escaping for every ton, and it was decided to remedy this at once.

WORK AND NEW DISCOVERIES.—At Terry's peak, in the Bald mountain section, a body of ore was recently found that gives returns of from $900 to $1100 a ton; the Homestake Mining Company, while running a shaft into one of its mines, struck a sixteen-inch vein of ore that assays several thousand dollars to the ton.

There are now over 4000 tons of gold-bearing ore brought into Lead and Deadwood daily, and it is being reduced by the mills, smelters and chlorination plants at these places. The Kildonan Mining Company, whose plant is situated at Pluma, a small place two miles south of Deadwood, and the Champion Mining Company's plant at Deadwood, are new concerns and so far have given satisfactory re-

sults to their owners. On November 1st the former mill started up and is now reducing 150 tons of ore daily. In a short time the operators expect to be able to reduce 300 tons a day. At the first cleanup at this mill recently, three gold bricks, valued at something over $32,000, were moulded

The Champion Mining Company has so far been unfortunate in getting its plant into working order. Several years ago a mill was erected in Spruce gulch, a little over a mile from Deadwood, but after being operated for a short time it was abandoned. A company organized in Chicago by W. R. Westfall, one of the original owners, purchased this mill and bought new machinery, consisting of immense ball pulverizers, the first ever used in the Hills, which were shipped in and put in place in the old mill. Two starts have been made, but a break in the machinery each time stopped work. The manager expects to have everything in readiness to start again in a few days, and will then be able to handle 100 tons of ore daily. The company has its own mine within 2000 feet of the mill, and therefore will be able to give satisfactory results to its owners when once in operation.

In addition to these two plants, the Deadwood and Delaware smelter, the Golden Reward reduction works, and the Black Hills cyanide works are running daily and handling all the ore they can work.

The smelter and the Black Hills cyanide works are the only concerns handling custom ore to any extent, the others mostly working ore from their own mines. The average price charged for treating the ore is about $8 a ton. There are a great many mines in this section the ore of which assays $15 and under a ton, that cannot be worked on account of the high price charged for treatment and the cost of hauling to the mill; but with a smelter or other reduction plant that could reduce the ore more cheaply and, at the same time, give both the reduction people and the mine owner a good profit, several hundred tons of ore daily would be shipped to Deadwood for treatment that is now lying in the mines.

### UTAH.

SULPHUR.—At Sulphurdale, Beaver county, formerly known as Cove creek, is one of the largest deposits of sulphur in the United States. It is thirty miles from the railway. Large works have been put in for refining and turning out the various grades. During 1895 the company shipped 3,000,000 pounds of refined sulphur to points in Utah, Idaho, Montana, Wyoming and Colorado.

CALIFORNIA BAR'S GOLD.—*Tribune*: Manager Mitchell, of the California Bar on the Colorado river, is in Salt Lake, bringing with him nine pounds of gold, about 960 fine, and of the value of about $1800, the result of about eight days' run with the employment of seven men. The bar embraces about 90 acres, five miles south of Dandy crossing, with its gravel rising from 10 to 30 feet above bedrock, and shows an average value of $1 per cubic yard. At present the handling of the gravel is being conducted with plow and scrapers, the gravel being shot down to the stream, where it is put through a Kent washer, with improvements made on the original by the owners of the bar, Messrs. Mitchell & Ryan.

### COLORADO.

GOLD OUTPUT FOR '95.—*Record*: One year ago the *Record*, and all other Colorado papers, predicted a wonderful increase in the gold output of Colorado, but we doubt if any placed it near the present showing. The product of all ores for '95 shows:

| | |
|---|---|
| Gold | $16,995,919 51 |
| Silver | 12,353,074 66 |
| Lead | 3,046,514 27 |
| Copper | 928,849 68 |
| Total | $33,324,358 12 |

And for the year '94:

| | |
|---|---|
| Gold | $10,616,463 00 |
| Silver | 14,931 240 00 |
| Lead | 3,223,615 00 |
| Copper | 767,420 00 |
| Total | $29,537,738 00 |
| Net increase for '95 | 3,786,620 12 |
| Increase of gold output | 6,379,456 51 |

To the credit of '95 should be added considerable gold bullion that was shipped East for speculative purposes, and not reported in Colorado. The amount is estimated at nearly half a million dollars. While first credit is due to the Cripple Creek output for this remarkable increase, sight must not be lost of Leadville, Gilpin and the San Juan regions, that have been steady and liberal producers.

A PERMANENT CAMP.—*Mail*: W. W. Allen, manager of the Pueblo Smelting and Refining Co., when asked his opinion of Cripple Creek, said: "Cripple Creek is undoubtedly a permanent camp, and one that will supply the smelters with a great tonnage for years to come. From the twelve mines regularly shipping to our works I find the ore averages over $100 a ton. Ore carrying an ounce in gold to the ton will barely pay all expenses of mining, transportation and treatment. Anything above that means a profit. The known mineral area is now so large that the most sanguine of the Cripple Creek mining men are justified in their statements as to the probabilities and possibilities of the district. I do not think we shall understand the formation of the camp for years to come yet. The district must be turned over and mined to a great depth and over a wide area before the situation can be scientifically demonstrated. The gold belt, in my opinion, extends from Palmer Lake to Creede, not mineralized all the way, but in many portions of that great extent and range large camps will be established in the future."

CUSTER COUNTY.

The Geyser, Bassick and Bull-Domingo are the three leading mines in Custer county. The Bassick, near Rosita, has shipped large quantities of rich mineral in the past, some of which was tellurium worth $4 and $5 a pound. It is still idle owing to litigation. The Bull-Domingo, near Silver Cliff, producing principally galena ores, has been worked some under lease.

The Geyser, on the porphyry belt adjoining the town of Silver Cliff, has shown the most development during '95. The main shaft is now 2100 feet deep and produces good ore. The company has placed a plant which will enable them to sink 4000 feet. Horn silver and chlorides were mined from the surface where this shaft has been sunk, but the company has not attempted to ship much ore. It has been sinking and developing.

There has been some leasing of mines in the vicinity of Rosita, but the need of a railroad, since the Denver and Rio Grande branch was washed out in Grape creek canyon about six years ago, has retarded the development of the mining interests. One of the proposed new lines is from Cotopaxi. Another new and practical route is the Florence and Southern, which, it is claimed by competent experts, can be built for $690,000. This line will be thirty-eight miles in length and the heaviest grade is only three and one-half per cent. The surveys and the plans and specifications have been made.

### NEW MEXICO.

CARLISLE DISTRICT.—Regarding the sale of Carlisle properties to the English and French syndicate, several properties not included in the first sale are now under consideration. Papers have been made out and forwarded to San Francisco for action, and it is confidently asserted that the sale is sure to go. The money will be paid through Wells, Fargo & Co. The Gladstone and three other properties are included in the sale. The amount to be paid is said to be $40,000.

### ARIZONA.

Two mines near Prescott are bought by J. Mackin and J. J. Philbin of Chicago. They are in the Groom Creek group, sixteen miles from Prescott. Four mines compose the group—the Gold Flake, Gold Bug, Grandee and J. W. Two tunnels already driven into the property show a three-foot vein. Mr. Philbin places an estimate of $20,000 a month on the yield.

### MICHIGAN.

DEEP SHAFT SINKING.—The copper-bearing conglomerate beds of the Calumet and Hecla Mining Company's property have up to within a few years been worked by inclined shafts. A few years ago the Tamarack Mining Company developed its property on the dip of a portion of the Calumet and Hecla ground by vertical shafts, which were sunk some 2000 feet before intersecting the copper-bearing beds. Since then both the Tamarack and the Calumet and Hecla have started a number of still deeper shafts, several being planned for a depth of 5000 feet. The following notes refer to one of these latter shafts: The dimensions are 13 feet 6 inches by 23 feet inside timbers, or 15 feet 6 inches by 25 feet outside timbers. The shaft is divided into six hoisting compartments, each 6 feet 3 inches by 7 feet in the clear, with timbers of southern yellow pine all 12x12 inches, the sets were placed 5 feet apart, center to center, with 12x12 inches distance pieces between them. Outside of these sets a lagging of 3-inch pine planks; with bearers let into the rock, every three or four sets depending on the character of the rock. The ground sunk through was mostly hard trap, and four Rand rock drills, 3⅛ inch, driven by compressed air at sixty pounds pressure, were used. The explosive was Hercules powder. Sinking buckets, sinking crosshead and dump trucks were also used. Two shifts per day, each consisting of twelve miners, seven fillers, six timber men, and one bell man were employed. 1000 feet was sunk the first year, and 1197 feet in another year; the rate of sinking during one month reaching 126 feet. The depth on July 1, 1895, was 4426 feet, and the present rate of sinking is about 70 feet per month. The monthly rate of driving crosscuts with dimensions of about 6x7 feet from this shaft during March, April, May, June, 1895, was as follows:—137 feet, 144 feet, 146 feet, 136 feet respectively.

## New Mining Companies Organized This Week.

Polar Star Mining Co., San Francisco; directors, M. F. Tarpey, W. B. Carr, W. W. Foote, W. W. Byrne and A. Byrne; capital stock, $10,000,000, of which $500 has been subscribed.

Gold Flat Consolidated Quartz Mining Co.; principal place of business, Grass Valley; capital stock, $1,000,000; directors, Jacob Weissbein, J. Weissbein, C. W. Kitts, E. D. Kitts and B. G. Weissbein of Grass Valley.

Murray Creek Mining Co. (reorganized); principal place of business, Oakland; capital stock, $100,000; directors, D. Husing, H. Gloy, H. Harfst, W. Miller and F. Franz of Oakland.

Caledonian & Ward Gold Mining Co.; principal place of business, San Francisco; capital stock, $1,000,000; directors, C. M. Ward of Grub Gulch, Madera county; D. M. Tomblin of Oakland, M. F. Cale, W. H. H. Hart and A. W. Livingstone of San Francisco.

Genevieve Mining and Milling Co., San Francisco; capital stock, $200,000, of which $120,000 has been subscribed; directors, J. M. Taylor, J. A. Votaw, N. B. Schilling, H. G. Comstock and F. M. Johnson.

The Winona Gold Mining Co., incorporated in this city; capital stock, $250,000, of which $10,030 has been subscribed; directors, A. N. Butte, J. J. Meyers, T. J. Solinsky, J. T. Wall and F. A. Moore.

The Bailey Triple Ledge Gold Mining Co. has incorporated in San Diego; capital stock, $100,000; directors, L. N. Bailey, Banner; A. C. Nason, O. C. Dranga, San Diego; E. A. Stanley, Julian; and J. A. Jasper, Ramona.

The Greenwood Gold Mining Co. has incorporated in this city; capital stock, $500,000, all subscribed; directors, G. Adams, C. S. Goodman, C. Joost, W. H. Brown and C. W. Keeney.

# Professional Cards.

**JOHN W. GRAY, Mining & Hydraulic Engineer.**
Explorations. Examinations, Reports, Surveys. Maps. Development and Working of Mines. Correspondence invited from those wishing to make investments in mines or secure and develop promising claims.
**Res.—923 Linden St., Oakland, Cal.**

**W. J. ADAMS, E. M.,**
**PRACTICAL MINING ENGINEER.**
Graduate of Columbia School of Mines. Expert on general mill work and amalgamation. Fifteen years' experience. Specialties: The saving of fine gold; vanner concentration and chlorination. Address Golden King M. Co., Alleghany City, Sierra Co., Cal.

**Mark B. Kerr,**
**MINING ENGINEER**
—AND—
**Deputy U. S. Mineral Surveyor.**
(Formerly Topographer U. S. G. S.)
**Valley Springs,.....Calaveras Co., Cal.**
Surveys executed and U. S. Patents obtained for Mining Claims, Mill Sites, etc.
S. F. address care Judson & Shepard, 402 Front.

**LOUIS FALKENAU,**
**STATE ASSAY OFFICE,**
**434 California St., near Montgomery.**
Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.
Court Expertine in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

**The Evans Assay Office.**
W. N. JEHU, - - - - Proprietor.
Successor to Jehu & Ogden.
**628 Montgomery Street, San Francisco.**
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

**School of Practical, Civil, Mechanical,**
**Electrical and Mining Engineering.**
Surveying, Architecture, Drawing and Assaying.
**723 Market St., San Francisco, Cal.**
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
☞ Send for Circular.

F. H. HARVEY. W. S. HUTCHINSON.
**HARVEY & HUTCHINSON,**
**GALT, CAL.,**
**Mining and Metallurgical Work in All Branches.**
Assays, Chemical Analysis of Ores and experiments on rebellious ores for treatment by cyanide or other processes. Surveys and reports upon mining properties.

W. B. TAYLOR. H. C. WARD.
**Nevada Metallurgical Works,**
Established 1869.
**Ores Crushed and Sampled and Working Tests Made by any Process.**
Assaying in all its branches.
Analyses of Ores, Minerals, Water, Etc.
**C. A. Luckhardt & Co.**
Formerly Riotte & Luckhardt
and Huhn & Luckhardt.
**Mining Engineers and Metallurgists.**
**No. 23 Stevenson Street,**
Near First and Market Sts., San Francisco.

**Everette's Mining Office.**
(Pioneer Mining Geologist's Office of the Pacific Northwest.)
MINING LAW, MINE EXAMINATIONS, METALLURGY, ASSAYING AND ANALYSIS.
"Consulting Associate Mining Attorney at Law."
Will examine and report upon "Title and Exact Value" of Gold, Silver, Lead, Copper, Coal, Iron, Clay or other Mineral Properties IN ANY PART OF THE WORLD. Any information mining men may desire to know, relative to the MINERAL or COAL resources of the entire Pacific Northwest, will be honestly given.
**Dr. Willis E. Everette,**
1141 R. R. Ave.
Tacoma, State of Washington, U. S. A.

**HERBERT LANG,**
**Mining and Smelting Engineer,**
**Shasta, Shasta Co., California.**

**WADE & WADE,**
**Analytical Chemists and Assayers,**
**109½ Commercial St., Los Angeles, Cal.**

**ALMARIN B. PAUL, M. E.,**
ROOM 49, CROCKER BUILDING.
Cor. Market and Montgomery Sts., San Francisco.
Will act as AGENT for the sale of RELIABLE Mining Property. Principals desiring valuable quartz or gravel investments at reasonable prices will do well to see what I may have. Only legitimate mining properties handled.

**EDWARD S. COBB,**
**MECHANICAL ENGINEER.**
**GENERAL MACHINERY.**
**HYDRAULICS, POWER, TESTS, ETC.**
**109 California Street,**
Rooms 30 and 31.....San Francisco, Cal.

ALBERT MALTMAN, Practical Metallurgist and Engineer.
SAMUEL C. THOMPSON, A. B. Yale University. E. M. Columbia University.
**Maltman & Thompson,**
**MINING ENGINEERS AND METALLURGISTS,**
Owners of Nevada County Reduction Works,
**Address: Grass Valley, Nevada County, California.**
Inspect and report upon Mineral Properties, Treat Refractory Gold Ores and Concentrates by Chlorination. Furnish Plans for and Superintend Erection of Chlorination Plants. General Analyses of Ores.

## Coast Industrial Notes.

—An advance of $2 per M. feet on lumber is expected after Feb. 1st.

—There will be a general advance on eastbound freight rates on the 24th inst.

—In 1892 San Francisco consumed 1,593,850 tons of coal; in 1893, 1,479,785 tons; in 1894, 1,527,759, and in '95, 1,653,520 tons, the highest figure in the history of the city.

—The Stockton Ice and Fuel Company has incorporated in Stockton; capital stock, $50,000; A. W. Brooks, S. Newell, I. F. Stein, T. W. Newell of Stockton and A. Cornwall of San Francisco directors.

—The California Foundry Company has incorporated here: capital stock, $50,000; H. J. Rogers, A. F. Morrison, C. E. A. Forster and E. Schwab of San Francisco and W. M. Gardner of Oakland directors.

—The Keystone Boiler Works has incorporated in this city. Capital stock, $200,000; J. Hamilton, J. J. Moore and J. V. Hunter of San Francisco and W. Leach and J. M. Robinson of Oakland, directors.

—The Clear Lake Power Company has incorporated in this city; capital stock, $2,000,000; with F. Formpals, J. H. Culver, W. McGeorge, G. E. Huddick of San Francisco and E. O. Blethen of Oakland directors.

—The Columbia Bituminous Rock Mining Company has incorporated here; capital stock, $50,000; T. E. Treacy, R. S. Maxwell, C. S. Harvey, A. B. Clute of San Francisco and D. H. Whittemore of San Rafael directors.

—The Mexican International railway now carries the traveler from New York City to the City of Mexico in four days and eighteen hours, and from New Orleans to the City of Mexico in sixty-nine and one-half hours, distance 3210 miles.

—Right of ways have been secured for the Vance Brothers' Railroad, which, except for a short stretch of water, will connect Eureka, Cal., by rail with Arcata. A crew of 100 men is at work. This is an extension of the Humboldt Bay and Trinidad Logging Railroad.

—Puget Sound loggers have formed the Puget Sound Timberman's Association, to unite all persons in the lumber business generally in an effort to secure a uniform classification and scale of logs, spars, etc., and the establishment from time to time of a uniform schedule of prices.

—The Kings River Electric Power Company has incorporated at Visalia; directors, S. F. Earl and J. S. Jones of Reedley, J. Sibley of Dinuba, C. D. Wilcox and W. H. Hammond of Visalia; capital stock, $360,000, all subscribed; object, to develop electricity for lighting, power and railway purposes.

—San Joaquin Co. has just finished a dam in the bend of the Calaveras river, four miles above Stockton, to confine the river to its bank at that point and shut out a large amount of the water that has flowed down upon Stockton in past years. Stockton is now hopeful that the periodical floods above the city will cease.

—Los Angeles papers report the production of the oil field for the past year to be nearly three times that of the previous year, amounting altogether to 1,368,750 barrels. The average price received was fifty cents per barrel, or $684,375 for the entire output. According to the estimate of the oil exchange, there are 250 wells which have been operated during the year, the mean product of each being about fifteen barrels daily.

—Work is progressing on the electric plant on the North Fork of the San Joaquin river, from which power will be transmitted over a distance of thirty-five miles to Fresno, and it is expected that current will be turned on by March 1. It is reported that surveys have been made and rights of way secured for a canal, four miles in length, to carry water from the mouth of Mill creek to the Cobble House, at which point a power house will be erected to generate 4000 horse power. The fall is forty-five feet.

—There were received at San Francisco from the East, just before the recent holidays, nine carloads of poultry. More than a hundred cars, of a value probably exceeding $200,000, are sent here every year from Missouri, Kansas, Iowa, Illinois and other States. Most of the shipments are made from October to January, and so important is the business that special cars, called palace poultry cars, have been prepared for it. About one-half of the eggs used here are also imported from the East, the volume of the business being about $400,000 a year.

—E. S. Mackey, one of the promoters of a window-glass and bottle works at Seattle, Wash., says the factory will soon be running. In speaking of the business outlook of the company, Mr. Mackey says the demand is enormous, and outside of the output of a small bottle manufactory here everything is imported from the East and Europe. There is demand enough in this city to keep a large-sized factory busy all the time. Fruit shippers in California are beginning to use glass jars in which to ship their fruit, one firm alone giving in an order for over 2,000,000 last year.

—In '95 California produced over $22,000,000 in mineral products, exported $18,499,002 gold and silver bullion, packed 1,280,000 cases canned fruit, distilled 1,000,000 gallons grape brandy, produced 49,000,000 pounds prunes, 162,700,000 pounds dried fruits, exported 10,600 carloads of oranges, produced 92,500,000 pounds grapes, 73,500,000 pounds beans, 47,365,000 pounds butter, 15,300,000 pounds cheese, packed $5,000,000 worth of provisions, distributed 400,000,000 pounds sugar, exported 80,000,000 pounds vegetables, produced $4,000,000 fishery products, exported wheat worth $9,981,394, produced wool to the extent of 31,000,000 pounds, manufactured 13,000,000 pounds of blasting and gun powder, imported 26,372,756 pounds coffee, distributed $137,463,298 in dividends, and had a population of 1,654,000.

—The *Mexican Financier* says: "Although not all the census returns have come in from the remote parts of the republic, the Department of Statistics has tabulated those already at hand, with the result that the 14,000,000 mark has been passed. So far the census shows the following interesting facts: The republic has 196 cities, 496 villages, 5213 towns 8872 haciendas, 26,607 ranches, 2469 small ranches, and 902 hamlets. The States which have most cities are Jalisco 16, San Luis Potosi 16, Guerrero 15, Puebla 14 and Zacatecas 11. The State which has the least number of cities is Colima, having only the capital. Chiapas has the largest number of haciendas, numbering 1393; Yucatan comes next with 1214, Tabasco 753, Sonora 664, Guanajuato more than 400, and then follow the States of Mexico, Puebla and Sinaloa."

—*Bradstreet's* reports 1076 failures in the Pacific Coast States and Territories for 1895, with assets of $3,534,543 and liabilities of $6,503,400, as compared with 1084 for the previous year with assets of $5,211,090 and liabilities of $9,539,530. The failures for the past year are divided as follows:

| *State.* | *No.* | *Assets.* | *Liabilities.* |
|---|---|---|---|
| California | 809 | $1,985,677 | $3,927,593 |
| Nevada | 10 | 27,050 | 66,600 |
| Oregon | 136 | 681,719 | 1,076,895 |
| Washington | 114 | 818,947 | 1,392,971 |
| Arizona | 7 | 21,150 | 39,341 |
| Totals | 1,076 | $3,534,543 | $6,503,400 |

The following are the causes assigned for the failures: Incompetency, 311; inexperience, 76; inadequate capital for the business undertaken, 447; injudicious crediting, 52; personal extravagance, 5; neglect of business and bad habits, 34; excessive competition, 7; unfavorable circumstances, floods, fires, etc., 82; speculation, 3; fraud, 64.

—Discussing Sec'y of the Navy Herbert's recent award of the construction of the two new battleships to the Newport News Construction and Drydock Co., on the Virginia coast, the New York *Herald* says: "While the price the Government will pay for these two vessels is much lower than the bids of the other builders, there are two reasons why Secretary Herbert would have done well to accept the bid of the Union Iron Works for one of them—especially as he would have had express warrant of law for such a decision.

"In the first place, the successful bidder has had no experience in building large ships of war; and while a 'prentice hand may be very capable, it would have been better not to put both eggs in one basket.

"Secondly, the present defenses of the approach to Newport News, where the two ships are to be built, are practically nil, and in case we should have war during the three years required to finish the vessels, a hostile fleet might be able to destroy them in the shipyard."

## Personal.

C. H. MALLON is now superintendent of the Delaware (West Harmony) mine, Nevada Co.

PHILIP MILLER is again superintendent of the Dillon Mining Co., Bald Mountain, Mont.

ROSS E. BROWNE has assumed the general management of the Oneida mine, Amador Co.

PROF. CARLYLE is expected at Vancouver, B. C., Feb. 1, to take charge of the Provincial Bureau of Mines.

A. T. WALFORD of Grass Valley succeeds C. A. Russ as superintendent of the Gold Basin mine at Kerby, Or.

H. E. D. MERRY, late assistant manager for H. H. Vivian & Co., Swansea, has been engaged by the Le Roi at Rossland, B. C.

CECIL RHODES has resigned the premiership of the Cape Colony. He retains the presidency of the South African Exploration Co.

COL. DAY has made the sale of the Sunnyside and other mines on the North Fork, Plumas Co., to the Eastern parties recently noted.

C. E. HOGG has resigned as the superintendent of the Sutro Tunnel. President Franklin Leonard will in future act in that capacity.

C. N. CASEY, eight years manager of the Rising Sun mine, near Colfax, Cal., has resigned to take charge of some property of his own at Placerville, Cal.

H. P GRUGER is superintending the manufacture of machinery of his own design for working the placer ground of the Bon Accord Mining Co., near Bannock, Mont.

CAPT. C. E. GILLETTE, of the United States corps of engineers, recently received promotion from the lieutenancy held when he first assumed duty as a member of the United States Debris Commission.

THOS. G. MERRILL, president of the Montana Mineral Land Commission, will address the executive committee of the California Miners' Association at a special meeting in this city next Tuesday evening.

W. E. MEAD of Ward, Colo., says regarding the Fauvel process, described in last week's issue, that a company is formed to put in a complete reduction works to utilize by that process the iron sulphide ores at Ward, Colorado.

LIEUT.-COL. BENYAURD, late of the United States Debris Commission, has taken up his new detail of work in Florida, and will be succeeded by Col. Chas. R. Suter. Major Heuer will in future superintend Government operations at Cincinnati, O., and leaves for there upon the arrival of Major C. E. L. B. Davis, who succeeds him.

## F. A. HUNTINGTON'S NEW IMPROVED
# Centrifugal Roller Quartz Mill.

This Improved Mill has the following advantages over my Geared Mills, viz:

**1st.**—I dispense with the wooden frame with posts and set the mill on heavy timbers or a concrete foundation, thereby securing a solidity that cannot be attained when set on posts.

**2d.**—I dispense with gearing and drive direct from the pulley.

**3d.**—There are five less places to oil.

**4th.**—The Mill is built much heavier and stronger than the former ones.

**5th.**—Being heavier and set on a solid foundation, it can be run much faster, thereby increasing its crushing capacity in the same proportion as centrifugal force is increased by increased velocity.

Manufactured by F. A. HUNTINGTON,
143 First Street, San Francisco, Cal.

BY USING

## THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

**Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines,** using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

| | |
|---|---|
| Coal Gas, ten hours' run, 1000 feet | $2 00 |
| Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c. | 1 25 |
| Coal Oil, ten hours' run, 7½ gallons @ 10c | 75 |
| Crude Petroleum, asphaltum base, 16 gallons @ 3c | 48 |
| Crude Petroleum (35 deg.), paraffine base, 13 gallons @ 5c | 65 |

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon=21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

# Market Reports.

## The Markets.

SAN FRANCISCO, Jan. 9, 1896.

The New York reports say the situation in the metal markets generally is somewhat clearer, but has by no means recovered its former buoyancy. With one exception, and that for a large amount of finished material, there is but little inquiry in the market for iron and steel. Pig iron is very quiet; there is no demand and little inquiry except from the smaller trade, and is insignificant. Quotations are nominal only. Bessemer is lower in the West at $11.50. Northern coke iron is quoted at $13.25@13.75 for No. 1; $12.25@12.75 for No. 2, and gray forge at $12.25 for best brands, while Southern brands are $13.50@14.00 for No. 1; $13.00@13.25 for No. 2, and $12.50@12.75 for No. 3. Forge grades are offered at $12.00@12.25; Nos. 1 and 2 soft, $12.50 and $12.00. Steel billets are very quiet at $18.50 and foreign at $25.50. Domestic wire rods are $27.25@27.50; foreign $25.00@25.50, and Swedish $43.50. Steel rails for any purpose show no inquiry and price is $28.75 tidewater. Finished iron and steel, as regards new business, are at a standstill. Quotations are 1.35@1.50c on bars; steel plate, 1.50@1.60c; tees, 1.75@1.80c; sheared plates, 1.60c; angles, 1.55@1.60c; beams, 1.65@1.70c. Spikes are $1.70@1.75; fish plates, $1.40; track bolts, $2.00 and $2.10, respectively, for square and hexagon nuts. Old material is a drug on the market just at present. Iron rails are lower at $13.00@13.25. Old car wheels, $10.50. Steel rails are $11.00@11.50 and No. 1 wrought, $12.00. Ferro-manganese is steady at $51.50 for 80 per cent. Spiegeleisen is easy and very quiet at $25.50@26.00 for 20 per cent and $19@20 for 10 to 12 per cent.

Copper is unchanged, but it is understood there has been a good deal of quiet buying by the large consumers at current low prices. Lake Superior ingot is dull at 10¼c. Electrolytic 10⅛@10¼c, and casting copper 9¾@10¼c. Nickel is quiet but steady at 35c. Antimony is easy at 6¾c for Hallet's and 7¾c for Cookson's. Spelter is easier at 3.40c and in light demand. Pig lead is lower and weak at 3.15c. Pig tin is steady at 13.75c. American tinplate continues to show good sales. Quotations are $4.75 for IC Melyn, IX $6.00 for 14x20, other grades and sizes in proportion.

Under date of the 3rd, D. Houston & Co., 22 Platt street, New York, discussing copper, say the market has declined to 10 cents, which exactly corresponds with the price one year ago. This low price has been established by a large sale made a few days ago by the Calumet & Hecla Co. at this figure to manufacturers for deliveries extending over the next three months. Previous to this sale domestic demand throughout December remained very dull, and a considerably lessened consumption for November and December contributed its share to prevent any improvement in the market.

During the dull season here, however, some leading sellers sold freely to Europe of various grades for deliveries well into the current year, at prices considerably above those now ruling. The European visible supply of copper has not been so small since 1888, and the stock of copper outside of Chili bars held in warehouse in England and France at this date is only sufficient for about half a month's ordinary requirements. From January 1st to the middle of December, 1895, the stock of American copper in those countries was reduced from 4972 tons to 1100 tons, while the total stocks of all kinds during this period were reduced 8454 tons, with deliveries 10,450 tons more than the previous eleven and a half months. The statistical position of copper is in a very satisfactory condition, and such as to warrant much better prices.

The year just closed opened with Lake copper 10 cents, and gradually became weaker until it reached 9½ early in March. Later in that month it touched 9.35, but from that point there was a slow recovery, with May opening up at 9¾, when the advance was steady and almost uninterrupted throughout June, July and August, when the climax was reached at 12¼. The market remained almost stationary throughout September at these figures, until early in October, when values slowly receded to 11¾ at the beginning of November. From this on the price dropped more rapidly until 11 cents was touched during the last half of November, from which there was no recovery. December opened dull and nominal when 10¾ was soon reached, the market easing off an ¼ at a time until the year wound up with copper at 10 cents again.

The following are United States copper statistics; tons of 2240 pounds:

| | | |
|---|---|---|
| Estimated stocks of copper January 1, 1895 | | 34,698 |
| United States production, including reporting mines and outside sources, for 11 months ending November 30, 1895, as per official returns | | 156,522 |
| United States production for December, 1895, (estimated) | | 15 660 |
| | | 206,880 |
| Exports of American copper for year 1895 | 63,782 | |
| Estimate of domestic consumption for year 1895 | 118,303 | 182 085 |
| Stocks January 1, 1896 | | 24,795 |

Exports of copper during December amounted to 7414 tons fine copper.

European copper statistics per cable to-day show an increase in stocks of 606 tons, and in visible supply of 256 tons.

London quotations for G. M. B. copper at the close to-day are £41.5 spot, and £41.12.6 futures.

The market for copper here this date is 10 cents for Lake.

## Mining Share Market.

SAN FRANCISCO, Jan. 9, 1896.

The entire list advanced slightly the past week. The largest percentage of gain was in the shares of the middle group of mines. The market does not act right from a speculative point of view. There is an absence of snap and life, which does not presage good for those that are long on the market. If there was any vitality it might lead to the belief that a moneyed pool was back of it, for experience has taught that when the latter are in the market lively moves and wide fluctuations are the order. This can be done owing to their being able to take at high prices every share thrown out by outsiders. They not only can buy all shares offered but they can also break prices quickly for another rise. The parties reported to be handling the market now seem to be afraid to make much of an advance for fear they could not be able to buy shares. By making a slight advance, say from 10 to 50 per cent, and even more on some, they can make the shorts fill and sell quite a line of shares on big bull points. The street is full of bull points — a big deal on foot. While this report may be correct, it does not stand to reason that those credited with manipulating the market would sell twenty-dollar pieces for five dollars, or in other words, they would not sell shares at present prices when by holding they could get considerable more money, provided their street reports are anywhere near correct. Dealers must not forget that the Hale & Norcross suit is still in court—not decided yet—and until this is well out of the way it is not at all likely moneyed men will go into the market. They are noted for not taking chances, they want an almost certainty before risking their money, and if the suit should go against their interests they would prefer letting others take chances and try to make a boom in the market. It is needless to say that the latter would fail, as they have done for months past.

The news from the Comstock mines is virtually unchanged, although there is every indication that in some the work grows in interest, but what it will result in, time alone can tell. In the Alta group they are still showing how well work can be done without finding anything of value. But there is some consolation: the work that is being done promises to lay the foundation for greater activity later on, provided the managers of the mines desire it. There are some who have great confidence in these mines, and that eventually ore of importance is likely to be found some time in this year. In the Gold Hill group the work that is being done in Overman points to better things before long, provided it is not changed so as to run in a direction which would be barren of results outside of assessments. From Seg. Belcher, Belcher, Crown Point and Yellow Jacket the news warrants better prices, but the public has been fooled so often on good prospects and the work reported in the right direction that it is hard to get them infused sufficiently to buy much. Several levels in two of the mines are being put in better condition for working more expeditiously later on. This work is to the west, so as to strike the ore found above. In the middle group of mines there is nothing of importance reported officially. A good deal of work is being done and there are chances for finding more ore than has yet been reported. They seem to be following up stringers or veins in the hope that they may lead to something of importance. In prosecuting this work some ore is extracted and raised. After exhausting the prospects the superintendents may push work to the west and see what can be found in that direction. In Best & Belcher and Gould & Curry there is no essential change in the work to report. Con. Virginia reports a larger output of ore with the assays slightly higher, still the market values of the shares have not advanced.

The slowness with which the shares move causes considerable disgust and creates a feeling of feverishness and uncertainty that does not look well. It would not take much to bring about a selling pressure and lower prices. If the mine promised well the shares would be cheap and insiders buy at present prices; this is what destroys confidence. In Ophir and Mexican they are still at work on the levels that have engaged attention for many months. On one of the levels they have been at work for over a year, and do not seem to be any nearer an ore body than when it was first started. In Sierra Nevada and Union there is nothing exciting or interesting to report. In Confidence, Challenge, Con. Imperial and Alpha they are still fooling around in the vicinity of the west lode. The ore found some time ago appears to have been lost, or at least nothing is reported to excite the cupidity of dealers.

On the Brunswick lode work is reported to be actively pushed, but so far as official letters go there is very little to encourage the belief that anything of importance will be found for some time yet. Even if a body of ore is found, it is not at all likely that much of an upmove in shares will follow in the absence of money backing. It is twenty-dollar pieces, and not ore, that make deals nowadays.

From the Bodie district nothing more comes to hand than the old stereotyped official letters, giving distances run and no ore run into. They will run into assessments before long.

The following is the usual monthly statement of moneys on hand:

| BODIE MINES. | | Con. Cal. & Va | $19,068 |
|---|---|---|---|
| Bodie | $11,503 | Exchequer | 4,287 |
| Bulwer | 3,780 | E. Sierra Nev | 28 |
| Mono | 920 | Gould & Curry | 9,889 |
| Standard | 25,415 | Hale & Norc'ss | 4,765 |
| Syndicate | 933 | Julia | 450 |
| WASHOE MINES. | | Justice | 205 |
| Alpha | $ 7,451 | Kentuck | 4,000 |
| Alta | 2 171 | Lady Wash'n | 158 |
| Andes | 2,183 | Mexican | 19,283 |
| Belcher | 1,774 | Ophir | 12,785 |
| Best & Belcher | 20,335 | Occidental | 499 |
| Bullion | 7,665 | Overman | 1,785 |
| Caledonia | 1,133 | Potosi | 19,560 |
| Challenge | 462 | Scorpion | 28 |
| Chollar | 18,510 | Seg. Belcher | 4,248 |
| Church | 16,202 | Sierra Nevada | 6,170 |
| Confidence | 6.550 | Silver Hill | 510 |
| Con. Imperial | 3,380 | Union Con | 5,371 |
| Con. New York | 198 | Utah | 2,497 |
| Crown Point | 534 | | |

The following mining companies reported having had an indebtedness on January 1st:

| | | | |
|---|---|---|---|
| Savage | $ 1,580 | Silver King | $ 5,437 |
| Summit | 1,638 | | |

The following illustrates the changes of the week:

| MINES. | Jan. 2. | Jan. 9. |
|---|---|---|
| Alpha | $ 26 | $ 23 |
| Alta Consolidated | 19 | 12 |
| Andes | 21 | 26 |

## DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Middle Fork Feather River, Plumas county, near La Porte.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 5th day of November, 1895, the several amounts set opposite the names of the respective shareholders, as follows:

| Names. | No. Cert. | No. Shares. | Amt. |
|---|---|---|---|
| L. M. Hoefler | 24 | 2,500 | $75 00 |
| L. M. Hoefler | 25 | 2,500 | 75 00 |
| L. M. Hoefler | 88 | 1,000 | 30 00 |
| L. M. Hoefler | 89 | 1,000 | 30 00 |
| L. M. Hoefler | 90 | 500 | 15 00 |
| L. M. Hoefler | 91 | 100 | 3 00 |
| L. M. Hoefler | 92 | 100 | 3 00 |
| L. M. Hoefler | 93 | 100 | 3 00 |
| L. M. Hoefler | 94 | 100 | 3 00 |
| L. M. Hoefler | 95 | 100 | 3 00 |
| L. M. Hoefler | 96 | 500 | 15 00 |
| L. M. Hoefler | 97 | 500 | 15 00 |
| L. M. Hoefler | 98 | 500 | 15 00 |
| L. M. Hoefler | 99 | 500 | 15 00 |
| Raymond Parry | 15 | 625 | 18 75 |

And in accordance with law, and an order from the Board of Directors, made on the 5th day of November, 1895, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 37 and 38 Crocker Building, San Francisco, California, on THURSDAY, the 16th day of January, 1896, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

E. C. GODFREY, Secretary.

Office, 37 and 38 Crocker Building, San Francisco, California.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR THE WEEK ENDING DECEMBER 31, 1895.

552,344.—WAGON JACK—Arata, Brunnelli & Arata, S. F.

552,098.—RAIL FASTENER—C. G. Chamberlain, Pacific Grove, Cal.

552,355.—SAW SUPPORT—A. J. Deetz, Sisson, Cal.

552,240.—FUNNEL—A. G. Dyer, S. F.

552,149.—SECURING WHEELS TO AXLES—W. F. McQuivey, Seattle, Wash.

552,384.—GAS LIGHTER—P. Meyer, Alameda, Cal.

552,385.—BLOW-OFF—Thomas Mitchell, Grantsville, Nev.

552,301.—MOP—E. Stebbinger, Portland, Or.

552,210.—DISH CLEANER—M. Stone, San Diego, Cal.

552,305.—ROLL PAPER HOLDER—Sullivan & Mathews, Seattle, Wash.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELECTRIC GAS LIGHTER.—Philip Meyer, Alameda, Cal. No. 552,384. Dated Dec. 31, 1895. This invention relates to that class of electric gas lighting devices in which opposing electrodes are located in proximity to the ignition point of the burner whereby, when the spark is generated, the gas is lighted. The invention is applicable to that class of burners known as "atmospheric" burners, in which the lighting surface or point of a Bunsen burner is enveloped by a mantle of a material adapted to become incandescent under heat, and it is especially applicable to that class of burners now known as the Welsbach. The invention consists essentially of electrodes centrally disposed upon the ignition surface of the burner, and suitable electrical connections for said electrodes. These connections include an inleading wire passing from without through the side of the burner at a point below the mantle and centrally upward through the burner to the electrode.

WAGON JACK.—Paolo Arata, Guglielmo Brunelli and Luigi Arata, of San Francisco, Cal. Assignors of one-fourth to Philip Giovannini of same place. No. 552,344. Dated Dec. 31, 1895. This invention relates to the class of wagon jacks, and more especially to those wagon-lifting devices which are adapted to elevate the entire wagon from the ground so that all its parts may be reached for washing, greasing, repairing, etc. The invention consists in an apparatus comprising a base frame, the upper surface of which is made on an incline, and a wheeled truck-frame adapted to freely pass under the wagon and while still thereunder to roll up the inclined plane of the base frame, whereby it is lifted up under the axles of the wagon, and said wagon is elevated. In connection with the truck-frame is a novel equalizing or adjusting frame.

BLOW-OFF FOR STEAM BOILERS.—Thomas Mitchell, of Grantsville, Nevada. No. 552,385. Dated Dec. 31, 1895. This invention relates to means by which the sediment in the bottoms of boilers is got rid of and the boilers cleaned. The object of the invention is to provide a blow-off device which is adapted to be moved from end to end of the boiler, while the latter is in use, and thereby reach and blow out the sediment completely and from all portions of the boiler. The device consists of a movable vehicle, carrying a suitable mouth-piece lying in the lower portion of the boiler; means for moving said vehicle and mouth-piece within the boiler to different points therein, and a yielding and controllable connection, whereby said mouth-piece communicates with the exterior.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from Joe G. De Bons in the Kerr mine, near Yankee Jims, Placer county, to impound tailings in Devil's canyon; from L. M. Sherwood et al. in the Sherwood & Snyder mine, near Chinese Camp, Tuolumne county, to impound tailings in Moccasin creek; from Henry A. Hallsted in the Clay Bank mine, near Meadow Valley, Plumas county, to impound tailings in a ravine; from W. H. Glenn & J. H. Hayden in the Blue Gravel mine, near Rancheria, Amador county, to impound tailings in Rancheria creek; from J. F. Evans in the Emma Harding mine, in Cook's canyon Plumas county, to impound tailings in a swamp; from John Smith in the Roman mine, Mountain Meadows, Lassen county, to impound tailings in a swamp; and from Wiley Sexton in the Kendall mine, near Grizzly Flat, El Dorado county, Cal., to impound tailings in Dogtown creek, gives notice that a meeting will be held at room 92, Flood building, San Francisco, Cal., January 13th, 1896, at 1:30 P. M.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from John Spaulding in the Polar Star mine near Dutch Flat, Placer Co., and T. G. Phelps in the Liberty Hill mine, Nevada Co., to impound tailings in Bear River, and from Olonzo Engle in the Adkins mine near Ono, Shasta Co., to impound tailings in a ravine, gives notice that a meeting will be held at room 92, Flood Building, San Francisco, Cal., on Jan. 20th, 1896, at 1:30 P. M.

## Assessment Notices.

SAVAGE MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works Virginia Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the fourth (4th) day of January, 1896, an assessment (No. 88) of twenty cents (20c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 50 Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the sixth (6th) day of February, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 26th day of February, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. B. HOLMES, Secretary.

Office—Room 50, Nevada Block, No. 309 Montgomery street, San Francisco, California.

WEST SIDE CANAL AND LAND COMPANY.—Location of principal place of business, San Francisco, California. Location of Works, Fresno and Kings counties, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 30th day of December, 1895, an assessment (No. 5) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 8, Floor 8, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of February, 1896, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 27th day of February, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. E. NAYLOR, Secretary.

Office, Room 8, Floor 8, Mills Building, San Francisco, California.

ANCHOR COAL AND DEVELOPMENT COMPANY. Location of principal place of business, San Francisco, California. Location of Works, Kelso, Cowlitz county, Washington.

Notice is hereby given, that at a meeting of the Board of Directors held on the second (2d) day of January, 1896, an assessment (No. 6) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 632 Market street, Room 5, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the third (3d) day of February, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the fifth (5th) day of March, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. D. FARISH, Secretary.

Office, No. 632 Market street, Room 5, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of December, 1895, an assessment (No. 21), of fifteen (15) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room No. 63, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of January, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of February, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 63, Nevada Block, No. 309 Montgomery street, San Francisco, California.

HITE GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the seventeenth day of December, 1895, an assessment (No. 2) of 10c (ten cents) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, Room 27, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of January, 1896, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 10th day of February, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. E. MATHEWS, Secretary.

Office—Room 27, 120 Sutter street, San Francisco, California.

## BOOKS ON ASSAYING.

*By C. H. AARON.*

### *Part I.—GOLD AND SILVER ORES.*

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

*Table of Contents:*—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assays; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12-mo pages, with illustrations, well bound in cloth; 1888. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press,** 220 Market St., San Francisco.

### *Parts II and III.—Gold and Silver Bullion, Lead, Copper, Tin, Etc.*

This book is entitled "Assaying—Parts II and III," and is separate from part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickle, Cobalt, etc.

*Table of Contents:*—Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickle and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, **$1.75.** Sold by the **Mining and Scientific Press,** 220 Market St., San Francisco.

## BOOKS ON WORKING ORES.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL, M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

By C. H. AARON.

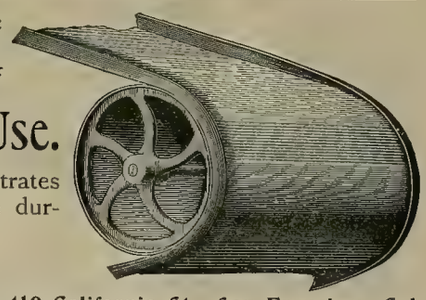
AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco

## The Explorers' and Assayers' Companion.

**A Third Edition of Selected Portions of the "Explorers', Miners' and Metallurgists' Companion."**

By J. S. PHILLIPS, M. E.

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy.



The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and discriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Price $6.00 postpaid. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

# Improved Ore Concentrator Belts. PATENTED.

(RIFFLED OR SMOOTH.)

## Suitable for all Ore Concentrating Machines in General Use.

These belts, with slight riffles at intervals, *will save* a greater percentage of valuable concentrates *than any other vanner belt.* Our new style flanges on the edge of the belt make it much more durable than any other. Send for circular and price list.

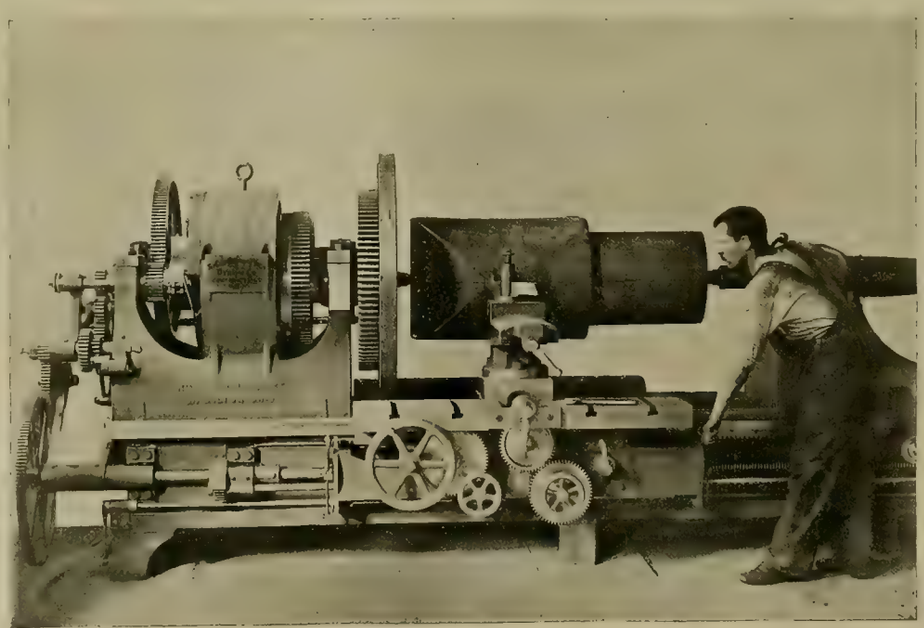
THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

### A New Ore Concentrator.



The new concentrator herewith illustrated is the invention of John O. Norbom, and manufactured by the Joshua Hendy Machine Works of this city. The machine is an endless belt vanner, built entirely of iron, the shaking frame or belt-carrying table made of channel irons; the eccentrics on the driving shaft are adjustable so that the table can be given different strokes, the 1-in. and 1½-in. being mostly used. Either a canvas or rubber belt, according to the character of the ore, is employed. There are devices for adjusting the grade of the table as well as for adjusting the belt speed. The device that gives the table its motion consists of four curved steel springs upon which the shaking frame rests. Two of these springs are placed on each side of the machine, curved or bent in opposite directions. The driving shaft lies on one side, and the eccentrics on this shaft, while giving a side motion to the table, cause the two springs on one side to bend down while the opposite springs straighten up, and vice versâ, thus giving a peculiar gentle side-tilting motion to the table. The longer the stroke, the greater the tilting. On a very short stroke the tilting or dipping of the sides of the table is very small. The machine can be worked on two different principles, viz., rubber belt, quick side-shaking motion with little tilting and short stroke; canvas belt, slow side-tilting motion and a long stroke. The manufacturers claim that this adjustability makes the machine suitable for almost any kind of concentrating gold ore, because operated on two principles of motion —either one of which concentrator manufacturers have always strived to attain — obviating the tendency of the pulp to pile up heavy and thick on the side of the belts along the edges, which reduces the effective surface of the belt and causes a loss of sulphurets that never could be separated from the gangue where the pulp was lying thick and dead. Where there is too much dipping of the edges of the table, the pulp would pile up heavy and thick in the center of the belt. It is claimed for this machine that the gentle tilting given by the curved springs overcomes the tendency of throwing the pulp to the sides, though not sufficiently strong to throw it to the center, and that the pulp is evenly distributed the full width of the belt, thus increasing the working capacity and close saving of sulphurets. While the machine takes care of the pulp from five stamps with ease, in one instance it is now taking the pulp from ten stamps, the ore carrying from four to six per cent of sulphurets. Mechanically, it is a substantial and durable machine. The canvas belt employed is made of heavy special-made duck. The belt has round edges, obtained by wrapping the canvas around rubber hose. The edges work in grooves on the end of the rollers, thus holding the belt in its place and preventing it from working sideways; the edges are protected so as not to be cut by the rollers. The machine is intended to meet the demand for a concentrator that can be adjusted in the mill to suit the character of the material treated, thereby avoiding the expense and inconvenience of putting up and trying two or three different makes to ascertain which motion gives the best result.

THE HENDY-NORBOM ORE CONCENTRATOR.

### Direct-Connected Motor and Lathe.

The lower engraving shows a direct-connected motor, built in the headstock of a 46-inch Niles Tool Works lathe. The motor is made upon a sleeve which slips over the spindle. Modern machine shops have traveling cranes, but in some cases the full advantages are lost, as it is difficult and expensive to place the tools so as to be easily served by the cranes. With a direct-connected motor on each large tool, shafting is dispensed with and the tool may be placed either to receive the work or to economize space. This motor runs at nine different speeds in either direction, from 57 to 275 revolutions per minute (the ordinary cone pulley runs at four or five), and the speed is controlled by a lever on either side of the apron of the carriage. As the position of the operator is always in front of his tool, this lever is always under his hand, and the motor can be stopped or the speed changed instantly from any speed in one direction to any speed in the other direction. As it is no trouble for the operator to change his speed, it is found in practice that he always keeps the tool cutting up to speed, which he generally does not do when he has a belt to shift. As the speed can be changed without stopping the lathe, the cutting speed can be kept constant as the tool works toward the center in facing off work, or the operator can avail himself of a quick return in chasing threads. This method is particularly desirable in turret lathe or similar work, where there are no two tools in the turret that should be run at the same speed to get the greatest amount of work from the tool. Most turret lathes have some mechanical arrangement for quickly throwing in or out some clutch or gears, thus giving two speeds without shifting a belt; but any one will appreciate the advantage of being able to instantly get any one of nine speeds in either direction, without shifting a belt or throwing a clutch. The power wasted in running line or countershafting is something enormous, and is seldom considered. In a test made in some thirty shops, it was found that the power thus wasted was sixty-eight per cent of the total power used when doing the ordinary work. A great saving in power can thus be obtained with the direct-connected motors. The motor herein described is built by the Card Electric Motor & Dynamo Co., of which J. W. Brooks & Co., 523 Mission street, this city, are general Western agents.

Coast Industrial Notes; Personal; Commercial Paragraphs, 54. Notices of Re-cent Patents; New Mining Companies Incorporated This Week, 59.

OF LATE long dispatches have appeared in Montana and Colorado papers, and sundry interviews with Montana mining lawyers published regarding the filing and holding of claims that uncontradicted may make mischief and mean loss to the Montana miner. Without going into the assertions in detail or answering them at length, it is in order to state for the benefit of our Montana readers that Congress has made no recent change in the federal mining laws; that the annual assessment work had to be done in '95, and, in all probability, must be done in '96, and that no successful attempt can be made to have those laws declared "unconstitutional." Even were such a thing possible, it would cost less to comply with the law than to start in the initial steps of such an undertaking. The State of Montana cannot make any law regarding mining or anything else that conflicts directly or indirectly with any United States law on the subject of legislation. The State of Montana has recently passed a new mining law applying, of course, solely to mining claims in that State, that defines how claims shall be located and worked. This law, it is believed, does not conflict with the U. S. statutes, and is, on the whole, a benefit to the Montana miner. It goes into detail in the manner of how the location shall be made, prescribes that the locator of the claim shall have ninety days in which to perfect the location and record it. The details of how the location shall be perfected—stating exactly the boundaries, in case of a lode claim sinking ten feet, etc.,—are also given, much of the statute being made up in accordance with governmental rulings and decisions of the federal law, and being manifestly with the honest intent to supplement, make plain and individualize the general mining law of the U. S., applying it under State sanction to one of the mining commonwealths.

GENERAL interest in the recent stirring news from South Africa is locally intensified by the arrest of John Hays Hammond, Charles Butters and Thomas Mein. These three are prominent among the many California miners that have been secured by South African mine owners to manage their properties. It is probable that upon proper representation and full understanding of the case the Boer Government will promptly release them. While President Kruger and the South African Republic no doubt have grave cause for reprisal and repression, yet it is unlikely that there exists just reason for any menace to resident Americans. California miners, some fifty in number, have gone to South Africa solely as a business proposition to intelligently administer and superintend great business interests. The fact of their business association with Englishmen, with whom the home Government has come in armed collision, in no way justifies arrest or threatened confiscation of private property, and it is very unlikely that men like Hammond, Butters, Clark, Williams, Mein, Leggett, Abadie, Starr, Stokes, Webb, Dahm, Clement, Garthwaite, Richardson, Hawley, Smith, Stoddart, Elliott, Harvey and others, who have the skill, ability and knowledge that has caused them to be selected of all men in the world to conduct the great mining projects in South Africa, would allow themselves to be mixed up in political or revolutionary complications. It is probably their prominence that has made them objects of suspicion. Hammond is the right hand of Cecil Rhodes in his great mining projects in South Africa, and, Rhodes being implicated in the recent Jameson affair, the Boers probably assume that Hammond and his fellow-Americans have had something to do with the recent armed conflict whose echoes have rung round the world. Prominent State and Federal officials have interested themselves in the case, and the fair presumption is that as soon as it is shown that they are American citizens and have minded their own business they will be promptly released, with apologies for their detention.

## Of Immediate Interest to Mine Owners.

The changes in the taxation statutes made by the last Legislature now in practical operation are capable of resulting in serious injury to the mining industry of this State. The danger of such injury is imminent and requires to be anticipated by prompt action. The trouble is in the delinquent tax sales, where in years past the State has been the purchaser and holds the certificate, and it originates from the practice of assessing unpatented mining claims, homestead and preemption rights as real property, or where improvements on these claims and the poll taxes of owners were assessed as being liens on the land. Failure to pay these taxes has largely been due to abandonments and forfeitures of rights, and at the delinquent sale no personal buyer desiring such unsubstantial rights, the State received the certificate. These certificates have heretofore not necessarily been a cloud on the title to the land. Under the operation of the new law, deeds to the State must now be made of the property represented by these old certificates, and the language of the law is such that the deed once made and recorded is a cloud on the title, for the statute asserts for such deeds the absolute title of all patented lands and the right of possession of unpatented lands, and makes the deed conclusive as to the regularity of all proceedings and sale. No procedure is provided by which any examination and cancellation of actually invalid certificates can be made, except at the instance of the present owner or claimant, and that under such limitations that only a small percentage of the certificates are reached. As the statute acts in most cases, the owner or claimant must pay the taxes and penalties of assessments on abandoned rights that his chain of title does not connect with, or have the State take a deed and cloud his title. Either that or a suit still more costly, to keep the tax collector from making the deed to his property. Even should that portion of the statute be declared unconstitutional, the deeds to the State of other similar cases are of record and needlessly increase the costs of abstracts and searches of title. Many of these old certificates contain indefinite descriptions that cannot be absolutely located. These, in the form of recorded deeds to the State and subsequently passed by sale by the State, will become a menace to the titles to valuable property that is, in fact, in no way connected with the property covered by the old tax sale. As the matter stands there is seemingly only one practical method of avoiding the clouding of titles or at the least cumbering the record of them. It is for the Tax Collector to refuse to make the deeds to the State until compelled by the courts. There is no question that if but this be done and the State sue him to make the deeds, the courts will declare all the certificates of sale of unpatented mining claims invalid and order their cancellation. Such action will save the clouding of titles or cumbering the records unnecessarily. It is difficult enough now to sell unpatented mining claims without adding to it additional uncertainties of title. The immediate attention of those interested is directed to this matter. It is their province and may well be their purpose to afford such legal aid as will assist in carrying out this suggestion.

## Last Wednesday's Convention.

Prominent representative men from all parts of the State affected met in this city last Wednesday in the River Improvement Association Convention. Their deliberations are of interest to the hydraulic miners of the State. Last Saturday, Congressman Johnson introduced a bill in Congress which, however unobjectionable in other respects, seems to ignore and set aside the two official reports to Congress of the resident engineer officers of the United States, in which they recommend an appropriation to begin the work outlined in the U. S. Debris Commission's plan of reclamation. The recent bill meets with the approval of the Anti-Debris Association, but appears to be in opposition to the endorsed plans of the Commission, and cannot in the nature of things be satisfactory to the miners, not being in accord with general public sentiment nor the patent facts in the case. These matters came up in last Wednesday's meeting. With considerable judgment and practical knowledge of present requirements in their broadest sense, T. J. Sherwood of Yuba submitted the following, which was not adopted:

*Resolved*, That this convention is in favor of the plan outlined and recommended in the report of the California Debris Commission dated December 4, 1894, known as the Deguerre Point dam, or barrier, in Yuba river, for the retention of the heavy material in the channel of said stream and its tributaries above said point. And we favor the appropriation of $300,000, therein recommended by the Board of Government Engineers, to construct said retaining barrier as the initial point in the betterment of the Sacramento and Feather rivers.

This was no idle or perfunctory compliment to the Commission, but an endorsement of the official and reiterated recommendation of the Commission by eighteen counties and seven cities directly interested. R. T. Devlin, representing the Anti-Debris Association, succeeded in having the bill introduced by Congressman Johnson last Saturday endorsed. The memorial closes by saying that

> The saving now effected by these navigable waters in freight rates, as compared with those prevailing by rail, amount to the producers of the State to more than $2,000,000 per annum, and by their further improving this saving could be doubled. It is absolutely necessary for the future and continuous prosperity of California that these waters should receive that attention from Congress that their importance, viewed from the standpoint of commerce and agriculture, demand. We call your attention particularly to the reports of Federal engineers on file at Washington, and ask, in addition to the recommendations for improvement therein contained, to extend the work still further. We particularly pray that this matter of improvement of the waterways of California may not be conducted on the patchwork system that hitherto has been observed, but that the Government will adopt a complete system for their improvement, and that whatever may be done shall be done as a part of a comprehensive plan under the contract system. We desire to remind you of the vast sums paid by California into the Federal treasury and the meager attention in comparison given by the Federal Government to California in return. On the ground of relief to the farmer and fruit grower, of the extension of commerce, of cheapened transportation, of reparation for past neglect and of solemn duty, in improving the navigable waters of this vast empire, we earnestly implore you to carry out all the recommendations for improvement made by the Government engineers, and to take such other means as may be necessary and proper to improve and extend these waterways so as to benefit not only the people of California, but of the whole Nation as well.

Five delegates—Wm. Johnston of Sacramento, J. M. Gleaves of Shasta, H. J. Corcoran of San Joaquin, W. A. Coulter of Santa Clara, and E. McGettigan of Solano—were selected to go to Washington to back the memorial to Congress praying for a comprehensive system of river improvement. Active interest was manifested, there was practical unanimity of opinion and action, and it is to be hoped that the result will be beneficial to the general interests of the commonwealth.

OF GOLD, and gold alone, it can be truthfully said that it never cost less to produce it than at the present time, and its present purchasing power is greater than it ever was. It may also be said that its international disturbing power was never greater, as witness Venezuela and the Transvaal.

## Concentrates.

THE Everett, Wash., smelter has resumed operations.

PLACER COUNTY water consumers want the rates reduced.

THE week's downpour of rain makes every miner in the State happy.

DELINQUENT local mining assessments in January aggregate $57,320; in January, '95, $151,000.

THE total product of the Pueblo, Colorado, smelters for 1895 in gold, silver and lead was $14,474,363.38.

OVER 3000 stamps are now dropping in the Rand district, South Africa, crushing 325,000 tons monthly.

NOW THAT Utah is a State, the territorial law against foreign investments is abrogated and aliens may buy mining property therein.

VERY little antimony was produced in this State in '95; the aggregate production of this country for the year was less than 850,000 pounds, even including that reduced from foreign ores.

THE option which Capt. De Lamar had on the Mercur, Utah, mine expired on the 10th. The mine has resumed dividends, declaring $25,000, or 12½ cents per share, payable next Monday.

THE Arizona *Citizen* hears that the Tucson Mining and Smelting Company has extensive improvements in contemplation, one being the purchase and erection of a fifty-ton water jacket.

FROM 472 tons base ore worked at the Mexican mill, the concentrates of which were sent to the Selby Smelting and Lead Works, the Ophir Mining Co. received $7326 gross. The total cost was $3.53 per ton.

A. DERATTI and ten others have leased the Flagstaff property, Ferguson district, Lincoln county, Nev., and will prospect the ore chute cut on the Boss ledge, and continue the main tunnel to the Apex ledge.

THE Genoa, Nev., *Courier* says the Eastern parties who bonded the Zirn group of mines have been given thirty days longer, until January 24th, to take the property. The price was raised from $75,000 to $80,000.

UNUSUAL snowfalls in Wyoming, Idaho and Utah make placer miners there predict that, considering the large number of hydraulic plants put in late in '95, the result of next season's work will be something great.

THE Prescott, Ariz., *Courier* thinks there are more men working for themselves and not in the employ of any man or company who are making a living at mining in that section "than in any other mining country known."

THE amicable relations between the mineral and agricultural interests in Oregon is illustrated by the appointment this week by the State agricultural college of a committee to add a mining department to that institution.

THERE was considerable falling off in the production of silver from domestic ore in the United States in '95, as compared with '94, the figures so far as procurable being 41,238,704 ounces fine last year and 49,846,875 the year before.

CONGRESSMAN JOHNSON has introduced a bill in Congress to the effect that all reservoir sites reserved or to be reserved by the Geological Survey be open to entry and use and occupation under the Right of Way Act of March 3, 1891.

THE House Committee on Public Lands has reported favorably on the bill introduced by Wilson of Idaho granting States twenty-five per cent of all money paid the United States for mineral lands within their respective borders for the support of schools of mines.

AT the Broken Hill Proprietary, Australia, for the week ending December 26th, '95, 6671 tons of ore were treated, yielding 514 tons of lead, containing 138,038 ounces silver; also 1126 tons treated by amalgamating and leaching plants, producing 12,486 ounces silver.

TO THE Nevada State University at Reno Supt. Lyman of the Con. Virginia mine has presented a steam pump for the mechanical shop; Supt. Keating of the Savage a steam pressure blower, and Supt. Williams of the Mexican mill a concentrator for the reduction works.

LAST Monday the Boise, Idaho, assay office shipped $32,257.32 gold. The figure is large for this season of the year, showing growth of the gold mining industry. January is usually a very dull month, the highest shipments for the entire month never having been more than $40,000 in any year.

DURING last month the Tacoma Smelting and Refining Co. shipped 7100 bars of bullion, weighing 730,185 pounds, valued at $96,396.27. There were 16,633 ounces gold, valued at $34,379.99; 58,644 ounces silver, valued at $39,145.24, and 728,065 ounces lead, valued at $22,371.04. The total product for the year was $760,548.57.

THE executive committee of the North Star Co. in East Kootenay, B. C., have accepted the tender of B. W. Jones for the transportation of 3000 tons of ore from Fort Steele to Jennings, Mont. The company has twenty-two teams engaged in hauling ore from the mine to the Kootenay river, averaging about thirty tons a day.

THE Anaconda Co.'s new electrolytic refinery is expected to be completed for operation next month, thus enabling them to produce as much as 6,000,000 pounds of electrolytic copper per month at their own works. The reserves of ore in sight are estimated to equal three years' production at the rate of 100,000,000 pounds copper per year.

A ST. LOUIS mining man is trying to organize a company to work the bed of the Sacramento river for gold. The plan is to secure a concession to dredge the river, manipulate the dredger for gold and use the debris in raising the levees. Numerous analyses of the bed of the river have been made and gold in satisfactory quantities has been found.

LAST Monday the Debris Commission granted permits to the Badger Hill and Clay Bank, near Spanish Ranch, Plumas county; Blue Gravel, near Rancheria, Amador county; Emma Hareing, Plumas county, and Roman, Lassen county. The Keer mine, near Yankee Jim's, Placer county, was authorized to build a dam. This makes to date, 145 applications granted of 198 made.

CALIFORNIA'S production of borax in '95 was about the same as for '94 -11,750,000 pounds. Nevada's also amounted to the same as the previous year, 1,500,000 pounds. The price fell from an average of seven cents per pound in '94 to five cents in '95, "the markets of the world" having been opened to the California and Nevada product by a reduction in the tariff on that article.

MENTION was made last week of the sale of the Gold Drop mine in the Boundary creek district. The purchase was made by the Montreal and British Columbia Prospecting and Promoting Co. The first payment, $1500, has been made; on July 1st a further payment of $6750 is to be made, and the balance, $6750, is to be paid on or before December 1st, a total of $15,000.

THE London *Mining World* editorially argues that the Venezuelan mines are not worth fighting for, that British investors have lost enough money already, and that the best thing they could do would be to hand over the whole country to the Americans. But the London *Mining World* has missed the point—the Americans don't covet the Venezuelan mines, nor a foot of Venezuelan territory.

J. W. KELLEY, of Bodie, was in Virginia, Nev., this week to inspect the mill designed and recently erected by J. H. Kinkead near the C. & C. shaft. He talks if the Kinkead process is suitable a similar one will be put up at Bodie to crush the old Bulwer dump. An illustrated description of the Kinkead process has been in preparation for the last two weeks and will appear in this paper next Saturday.

COLORADO ore dealers note with dissatisfaction a constant tendency toward higher prices for smelter treatment, and say that there is plenty of room for another smelter in Denver. The Colorado smelters that were running last spring at scarcely half their capacity are reported to be in full blast and hardly able to handle all the ore offered them, notwithstanding the fact that most of them have meanwhile largely increased their plants.

ACCORDING to the Reno, Nevada, *Journal*, A. Livingston, of Carson, recently purchased a mining claim in Pine Nut of Wm. Zirn for $50, the understanding being that Zirn would return and put in a blast to burn the lime cap off. He did so and when the smoke cleared away he saw one of the richest pockets yet seen in Pine Nut. He hastened in and endeavored to buy the property back again, but Mr. Livingston refused to sell and is still the owner.

AT the Cariboo and Horsefly hydraulic mines, Cariboo, B. C., during the past season $635,000 has been expended, getting ready for work. J. B. Hobson, in charge of the work, says that the average Chinaman employed by him in ditch work, and paid $1.75 per day, moved three cubic yards of earth per day, while the white laborers in the same ground, paid $2.50 per day, moved on an average seven yards per day. Work will be resumed in the spring, when good monthly returns are expected.

NUMEROUS were the men who were ever ready to tell how they "staked" John W. Mackay. Every California miner knows one or two who were the first that helped him ever before the days that that millionaire miner used to pack a dinner pail. A new crop of those philanthropists is now showing up in the persons of people who were the first to help W. S. Stratton, the millionaire miner of Cripple Creek. If Colorado prove as rich in such reminiscence as California it will turn out a good many who were the original aiders of that much talked of man.

WHILE San Francisco, Alameda and other counties through their boards of supervisors have endorsed the pending hydraulic mining legislation in Congress, Sacramento county's board of supervisors have unanimously resolved that "we are unalterably opposed to the resumption of hydraulic mining, and protest against the passage of any bill committing the government to the resumption of hydraulic mining, or the building of dams at government expense." Still it is hoped Sacramento county will not secede from the State.

IT would pay some one who has the time and ability to get up a prospector's handbook, a compact little 100 pages, giving in handy shape some condensed practical points about practical mineralogy, ore, assaying, etc. Every week there are two or three applications at this office for such a work. The Colliery Engineering Co., Scranton, Penn., some time ago published such a little work, written by a Colorado miner, which, though largely local in its nature, is meeting with good sale. Such a little volume compiled by a Californian would certainly be a good hit at present.

DURING '95 the San Francisco Mint coined $25,427,213, against $25,447,053 in '94. Last year's coinage consisted of $22,870,000 in double eagles, $490,000 in eagles, $560,000 in half eagles, $400,000 in standard dollars, $554,043 in half dollars, $441,170 in quarter dollars and $112,000 in dimes. While the difference between the two years is only $20,000, there was an increase of $419,500 in the gold coinage and a decrease of $439,310 in the silver coinage. Since the establishment of the Mint in this city in April, 1854, the coinage has been as follows: Gold coinage, $870,356,857; silver coinage, $137,786,693; total, $1,008,143,550.

SECTION 11 of Arizona's new mining law says: "The relocation of forfeited or abandoned lode claims shall only be made by sinking a new discovery shaft and fixing new boundaries in the same manner and to same extent as is required in making a new location; or the relocator may sink the original discovery shaft ten feet deeper than it was at date of commencement of such relocation, and shall erect new or make the old monuments the same as originally required. In either case a new location monument shall be erected, and the location certificate shall state if the whole or any part of the new location is located as abandoned property."

SOUTHERN OREGON miners would do well to note the publication notices issued from the Roseburg Land Office of lands for which patents are asked by the Oregon and California Railway Company, comprising the east part of the south half of Section 23, township 39 south, range 1 east, which is in the neighborhood of Neil creek; also part of the west half of Section 7, in township 37 south, range 2 west, near Jacksonville; also parts of a large number of sections in township 35 south, range 4 west, in the Evans Creek district. In another notice of the same date there is listed part of the east half of Section 10, township 38 south, range 1 east, north of Ashland, in Antelope district; also part of Section 31, township 38 south, range 1 east. This is near the Golden Fleece mine, now known as the Edna; also a part of the east half of Section 35, township 39, range 1 east, this within the Ashland Butte timber reserve. On the Siskiyou it comprises nearly all the odd sections in township 40 south, range 2 east, and in the same township south, range 3 east, and the odd sections in a large tract of land in the Dead Indian country. Those interested have only another month in which to make special and detailed protest.

DURING '95 there were 33,789 flasks of quicksilver of 76½ lbs. each received at San Francisco. The receipts for '94 were 26,082 flasks; '93, 26,034; '92, 21,686; '91, 14,556; '90, 13,130. The receipts represent about the annual yield of the State. Twenty years ago the production of California quicksilver mines was 75,000 flasks. During the year there were sent by sea 18,436 flasks, 11,698 to New York, the rest to Mexico, Central America, and British Columbia; there were also shipped east by rail 13,429 flasks. The price in the earlier months of the year was $36.50 per flask, being $40 for the last four months of the twelve. The duty on foreign quicksilver which for many years was ten cents per pound is now seven.

CALIFORNIA still occupies first place in the gold producing States of the Union, and the United States first place in the gold-producing countries of the world. According to the estimate of the Director of the Mint, the gold yield of this nation for '95 was $52,644,000, which, however, is probably about $6,000,000 too great. When exact figures are reached, the total will not be far from $46,000,000. In '94 it was $39,500,000. South Africa's aggregate for '95 will probably be $45,000,000; Australasia third with an approximate yield of $33,000,000; Russia fourth with about $35,000,000. It is probable that last year's gold output of the world aggregates $205,000,000 in value, an increase of $26,000,000 over '94, and that in '96 the total gold yield will be close to $225,000,000.

IN the Old Dominion copper mine, Arizona, at the first level a vein of 20% ore was exposed 3 feet 3 inches in width, which it is expected will continue to surface, yielding a great deal of ore at this point. Ore of the same quality was found at the second level, while at the third level a solid ore top and bottom and side for 40 feet was encountered, some of which assayed 43% copper. It is believed this will extend down through virgin ground to fifth level. At that level a winze was sunk for 43 feet in oxide ore. This will be one of the largest stopes and will yield both oxides and sulphides. Pay ore was found at seventh level and also at eighth level. The main shaft has been sunk 25 feet below the eighth level and another compartment added.

WHAT this paper considers the best mining authority in Colorado furnishes the following regarding the gold and silver yield of that State: "The output for 1894 was as follows: Gold, 513,571 ounces, valued at $10,616,463; silver, 23,747,915 ounces, having a coinage value of $30,704,375 and a market value of $14,721,751; lead, $3,199,175; and copper, $761,575. The output for '95 is conservatively estimated at: Gold, $15,500,000; silver, $12,500 000; lead, $2,850,000; and copper, $850,000. There is a decline in silver, a slight decrease in its companion metal and an increase in copper. The gold output has made a big jump, chiefly due to the fact that Cripple Creek increased from $3,000,000 to $8,000,000. It would seem at the time of this writing that the gold yield of California and Colorado was last year very nearly equal."

PROBABLY the most prominent mining engineer in the world to-day is John Hays Hammond, whose recent arrest at Johannesburg, South Africa, and removal to Pretoria has occasioned so much comment. The arrest was because of his intimate connection with Cecil Rhodes, and the latter's political difficulties with the Transvaal government. Hammond is a Californian, is at the head of many South African mining enterprises, practically directs the movements of over 18,000 men, has nearly twenty mining superintendents, Californians all of them, and has made considerable money in legitimate enterprises. He is of course a shining mark. His arrest and one or two other incidents there emphasize the need of an official American representative to attend to governmental affairs in that country.

DUE acknowledgement is made of a most cordial invitation from Pres't Dennis to attend the convention of the Northwestern Miners' Association in Spokane, Wash., on the 22nd prox. Among other pleasant things, the invitation says: "The object of the convention is for the discussion of mining and science, and to obtain a more intelligent understanding of the needs, legislative and otherwise, of the States of Washington, Montana, Idaho, Oregon and the province of British Columbia upon this topic, all of which territory is embraced within the jurisdiction of this Association. The occasion is one of great importance to the mining interests and will do more to perpetuate the greatness of the work than any other effort heretofore put forth. I have the pleasure to extend to you an urgent invitation to attend, and to address the convention upon some topic of mining. The Association asks that you be its guest of honor, and in doing so will most sensibly appreciate the distinction of your presence. You are also most cordially invited to a seat at the banquet, and there to be one of our honored guests." Organization is necessary for the protection and proper perpetuation of the mining industry, and the Northwestern Miners' Association deserves a meed of success commensurate with the extent of the interests it proposes to represent and foster.

D. F. VERDANAL, in his New York correspondence to the San Francisco *Chronicle*, writes as follows of an old-time Grass Valley mining man and editor: "George D. Roberts, the veteran mine operator, who has been looking for a real good mine property for years—sampling the country from Maine to Alaska to South America—sailed for London last week with 'Eureka!' emblazoned in his colors. 'After looking everywhere for a mine, where do you suppose I found it?' queried George, with a merry twinkle in his eye. 'Why, out in California, on the mother lode, right under my very nose for years. It is a gold property, has been paying handsomely, and will pay bigger with increased facilities. After all, California is the place where you find the gold. Cripple Creek? Oh, yes; big mines there, but more money will be lost in speculation there than will be taken out of the earth. California gold mines have been paying for nearly half a century, and I really believe they have only commenced to open up quartz mines as they should be. I am taking this mother-lode mine over to London for an English syndicate that want all the good gold mines they can get, and they are willing to pay for them.'" George is now waxing along in years, but he doesn't look much older than when, in the early days, he put up and worked the first Grass Valley quartz mill.

## Treatment of Low-Grade Ore.

Written by EDMUND B. KIRBY. M. E., Denver, Colorado.

Notwithstanding the remarkable records of African gold fields, all present developments show that the United States will continue to produce more of the world's gold supply than any other country. It is not so generally understood that mining men have only begun to utilize the great resources of the West in low-grade ores. As metallurgical skill is applied to the various large deposits already known and exposed, it will be found that no new processes are necessary to make many of them yield a handsome profit. All that is required is an intelligent selection and application of some one of the methods already known and in use. It is therefore a matter of interest to describe the principal differences in low-grade ores and the way in which these differences affect the selection of a milling process.

It is well understood that of the two general divisions, "sulphide" and "oxidized ores," the former includes all those forms in which gold was originally deposited in veins. Within reach of the aerated surface waters the sulphide minerals are found more or less decomposed, with their gold contents set free. Nature has here done slowly the very work which would otherwise have to be performed in roasting furnaces.

Various other products, such as iron oxide and the secondary minerals of copper, zinc and lead, also result from this decomposition and seriously affect the milling character of these "oxidized" ores.

In sulphide ores by far the most common gold-bearing mineral is iron pyrite. Copper pyrites, the telluride minerals, zinc blende and galena are also apt to occur and are named in order of their frequency. Most ores consist of ordinary rocks or vein quartz with crystals of ore or several of the above minerals sprinkled through the mass. Unless the ore has been partly oxidized there is no gold present, except what is contained in those crystals.

Now, the investigations of recent years have already established the fact that the gold in a crystal of iron pyrite is generally, and perhaps always, in the metallic state. It is not, however, disseminated uniformly throughout the substance of the crystal. On the contrary, the gold is in the form of thin sheets or delicate films, gilding portions of the surface or filling the microscopic crevices caused by the cleavages of the crystal. In ordinary amalgamation the mercury readily attacks the gold upon all exposed surfaces, but cannot reach that within the cleavage crevices.

If the crystal is shattered to very small fragments by fine crushing or grinding, the fractures always occur along the natural cleavage planes, thus exposing more of the gold fibers. Fine grinding and thorough amalgamation will thus extract most of the gold contents from pyritic ores. Under the practical limits of mill work, however, the sulphur interferes with amalgamation and there is also a large percentage of gold which cannot be reached by the mercury. Pyrites from different mines differ greatly as to the percentage they will yield in this way.

Less is known about the distribution of gold in crystals of blende or galena. Some of it is certainly in the metallic state as fibers in the cleavage planes, but these are either very minute or else the bulk of the gold is uniformly distributed through the mass of the crystal. Fine grinding and amalgamation therefore extracts a much smaller percentage from blende and little or nothing from galena. The gold in copper pyrites and tellurides is generally uniformly distributed and amalgamation is useless upon these minerals.

In ores completely oxidized the gold is not by any means always free milling or within the reach of mercury. This is only true when the liberated gold occurs in particles large enough to be exposed or broken entirely apart from the rock by stamp crushing. But in a large number of valuable gold deposits the oxidized ore yields little to amalgamation.

The old theory of rusty gold, created to account for this difficulty is now known to be a myth. In such cases it is almost invariably found that the trouble is due to the extremely small size of the gold particles. Microscopic measurements have shown that in many ores a large proportion of these particles range from one two-thousandth to one ten-thousandth of an inch in diameter. The smallest grains of rock produced by crushing may therefore be large enough to completely enclose a number of such minute particles and protect them from the action of mercury.

In these cases extremely fine grinding and perfect amalgamation, such as may be secured by milling in pans, will sometimes give a satisfactory yield, but it is generally unnecessary, as in the case of Cripple Creek ores, to resort to wet processes. It is interesting to notice that the gold liberated by the oxidization of iron pyrite is generally coarse enough for ordinary free milling.

Telluride minerals, on the contrary, deposit their gold in the form of microscopic powder which it is impossible to mill in the usual way without very heavy loss. The ores of Cripple Creek are a notable illustration of this. As a matter of fact very few mines have ore which is entirely oxidized. Even during the first few years of operation, while the ore is nominally free milling, it contains more or less original sulphide crystals which have escaped oxidation. This percentage increases with depth and the ore sooner or later passes entirely into unaltered sulphide.

This method of milling must therefore be changed to correspond with the new character of the ore. It is of the greatest importance to a mine owner to provide for this beforehand and arrange to lose as little capital as possible by changing from one process to another.

With a large supply of ore completely oxidized and strictly free milling there can be no question as to the best plant. A modern high-speed stamp mill should be used, with simple battery and plate amalgamation. It ought to be of the California type, because the greatest daily crushing capacity is wanted rather than perfect amalgamation. There is no trouble in saving a satisfactory percentage with such favorable ore. The cost ranges from 35 cents to $1 per ton, according to the size of the mill and its design.

In the usual case where the ore is partly oxidized but also contains a certain percentage of sulphide crystals, these should be separated by adding simple concentrating machines to the California mill. The concentrates are sold to smelters and treated by Plattner combination, the latter plan being adopted in remote places. The cost of freight and smelting charges upon the small bulk of concentrates is here added to the first expense of milling. For instance, if ore milled at an expense of sixty cents per ton yields one-tenth its weight of concentrates and the freight and smelting charges upon each ton of this product is $8, then 80 cents per ton of ore must be added to the sixty cents, making the total expense $1.40 per ton of ore.

When the gold is free but too finely subdivided for the above treatment, the mill is arranged to crush by stamps and amalgamate in pans. These grind the stamp sands very fine and give the most perfect amalgamation possible. The American mill pan is such a thorough amalgamator that it seems to leave no room whatever for improving this operation. If inventors realized its efficiency they would stop trying to design new amalgamators and devote their efforts towards the improvement of other operations in the milling process.

The Gilpin county type of stamp mill was evolved to treat more difficult ores than the above, but little or not at all oxidized. To secure a high extraction they ought to be milled by some one of the more complex processes hereafter mentioned. These, however, require very expensive plants and must treat a large tonnage in order to be cheap. Since the average mine owner has neither the tonnage nor the capital needed, such processes are generally out of his reach. In these cases the simple, cheap and slow Gilpin county stamp mill is a great blessing. It has solved the problem for many a poor mine owner struggling with fortune and put him financially upon his feet. It may not save more than sixty or seventy per cent of the gold, but this is enough if it enables the mine to clear a profit. The Gilpin county mill crushes very slowly, but exceeding fine. The sulphide crystals are broken so small that most of the gold films in the cleavage planes are exposed. Everything is arranged so as to secure the most thorough amalgamation possible with a battery and plates, and in this way even the sulphides yield enough of their gold for profit.

When within reach of the smelter market the impoverished sulphides are then separated and sold. Since they contain only a portion of their original contents, it is no longer necessary to do this carefully, and simple, cheap concentrating machinery like Colorado bumping tables is good enough for the purpose.

It is impossible to either amalgamate or concentrate telluride minerals, and when these are present it is necessary to treat by barrel chlorination or the cyanide process.

If a mine with sulphide ore is able to supply enough tonnage, and the necessary capital can be raised, it generally pays to adopt one of the more complex processes, designed to save a higher percentage of the gold. Of these, combination milling is the cheapest in both first cost and expense of working, and should, therefore, be the first considered. This is merely an improvement on the usual method of amalgamation, followed by concentration. The plant is, therefore, more elaborate and expensive, and is arranged to concentrate out the sulphides first and then amalgamate whatever free gold remains in the ore. The reason for this reversal is that the fine crushing required for amalgamation interferes with the subsequent work of concentration, which is best performed on coarsely crushed ore. Moreover, the presence of sulphides interferes seriously with amalgamation, and it is, therefore, desirable to have them out of the way. In many cases the preliminary concentration secures all the gold and further treatment by amalgamation is unnecessary.

Two general types of combination plants are in use. In one the ore is crushed by stamps to the usual sand size and then treated on vanners or other simple concentrating machines. The sands, now free from sulphides, are then ground fine and amalgamated in pans.

In the second type the ore is crushed by rolls to about bean size. It is then treated in a complete concentrating plant of screens, jigs, hydraulic sizers, buddles, vanners, etc., more or less elaborate, according to the requirements of the case. The tailings from the concentrating department are then recrushed to sand size and amalgamated on plates or in pans. Combination plants of fifty tons daily capacity cost from $30,000 to $60,000, and the expense per ton is also greater; but a much larger extraction is secured.

When the problem cannot be solved by any of the above methods it is necessary to resort to barrel chlorination or the cyanide process. In barrel chlorination all the sulphides must first be removed by roasting before chlorine can act effectively upon the ore. This is more difficult and expensive than ordinary roasting, where a complete removal is not necessary. In ores like those of Cripple Creek, with only one to two per cent of sulphur, this is not a very expensive matter, but when the sulphur amounts to seven to twenty per cent, as in so many gold ores, the cost of dead roasting becomes very heavy and practically bars the use of the process upon ores. Concentrates may be treated notwithstanding their high sulphur contents, because the bulk is so small compared with the original ore that the increased expense is not a serious matter.

Another objection to the chlorination is that no silver is saved, and, since most gold ores also contain silver, the loss from this cause may be serious.

The cyanide process requires no roasting, since the solutions penetrate the cleavage planes of the sulphide crystals and dissolve a large percentage of both gold and silver. Neither process will recover the gold present in coarse flakes and grains. Both require very expensive and carefully designed plants, which may cost $50,000 to $75,000 for fifty tons daily capacity. Chlorination extracts ninety to ninety-four per cent of the gold only, while the cyanide process recovers seventy-five to eighty per cent of both gold and silver. The latter is, therefore, specially adapted to the lower grades of ores, and its expense is about two-thirds that of chlorination. Each process has its own field of application, and the question as to which is best for a given case is not easy to decide.

At present the cyanide process is being applied to ores in three different ways:

First—As an adjunct to the process of ordinary wet stamp milling. The tailings from the stamp mill are further treated in a cyanide department. This is the method in universal use throughout the South African fields. At first the old dumps of accumulated tailings were worked up, and then the cyanide plants were modified to take fresh tailings continuously from the stamp mills. The system has the following advantages: It is the cheapest of the three in cost of plant and expense per ton. All large grains of gold which would escape from cyanide solutions are saved by the amalgamation. Moreover, since many of the mills use concentrating machines, the sulphides are separated in a small bulk, and this is treated with more care and expense than would be profitable upon the ore itself. The disadvantage of the system is that the crushed material flowing as tailings from a wet stamp mill contains such a large proportion of flour-size particles or slimes that the cyanide solutions will not percolate through it. It is, therefore, necessary to separate the sands from the slimes and treat only the former. The slimes, amounting to thirty per cent of the total weight, have to be thrown away. The Johannesburg ores average $12 in gold and the stamp mill amalgamation takes out about sixty per cent of this, or $7, leaving $5 per ton in the tailings. Thirty per cent of these tailings are thrown away as slimes and the remaining sands are subject to cyanide treatment. This extracts seventy per cent of the gold in the sands, making the total recovery $9.50, or about eighty per cent of the gold originally present in the ore. The remaining $2.50 is lost. If it were only possible to treat these slimes effectively by cyanide, this system would be the one best suited to most mines in the United States. A cyanide plant could then be attached with ease to any Western stamp mill and the saving greatly improved. Up to the present such attempts in this country have been failures. Various plans have been proposed to overcome the difficulty, and it is probable that a working plant could now be built to treat slimes.

Second—The ore is crushed in an ordinary dry crushing stamp mill. It is placed dry in vats and the cyanide solutions allowed to percolate through the mass. This system has been tried in New Zealand, Australia and various parts of this country. Its results have, on the whole, been rather unsatisfactory. The trouble is that dry stamp crushing produces so much fine powder that percolation is very difficult and slow.

Third—The ore is crushed dry in a more complicated and expensive plant of rolls and screens. The object of this is to avoid the production of slimes and thus to do away with all the difficulties of percolation. It is a very delicate undertaking to accomplish this without at the same time having the

grains of ore so coarse that the solutions cannot reach their gold contents. The large number of failures which have occurred in the attempts to apply cyanide by this system have made it clear that in order to ensure success it is necessary to have a very expensive plant, designed by the best metallurgical skill.

The best designed and most successful plant in the world for the use of cyanide by this system is that of the Metallic Extraction Company at Florence, Colorado.

The first and third of the systems described are those now approved by the experience of metallurgists. Each one is best adapted to certain conditions and it would be a very expensive error to select the wrong one.

Various districts of the West contain sulphide gold ores of such a character that it is impossible to treat them by any of the above methods. In such cases the pyrites constitute the principal bulk of the ore, and it is impossible to amalgamate, concentrate or treat by wet process at a profit. The Austin process of pyritic smelting will frequently meet the requirements of such cases. The gold and silver are collected in a small bulk of copper-iron matte, which is then shipped to refining works for separation. Little or no fuel is required, since the charge is smelted by the heat produced from the combustion of its own sulphur. A very peculiar and rare combination of conditions, both technical and commercial, are required to make this process pay, but when these are secured it is very effective.

In conclusion, it may be said that the selection of a process is not generally a simple matter. The large number of wrecked mills throughout the West attest the frequency with which mistakes occur. The best treatment can always be determined beforehand by suitable tests, and it is poor economy to omit this safeguard. One great source of danger is the difficulty in securing samples for these tests which really represent the future ore supply. It is also necessary to determine what probable changes will occur in the character of the ore as mining continues.

---

THE most important, as well as the commonest, metal of the world is iron. It is almost everywhere in nature. We are bombarded from cosmic spaces by meteorites of nearly pure iron; the spectroscope finds it in stars so distant that the naked eye sees but emptiness in the abysses wherein they burn. It makes a twelfth part of the crust of the earth. Its particles are mingled in the dust of every country road, in the air we breathe, in the water we drink, in the food we eat. It is the great colorist of nature. Even the red of our blood is due to its presence.

---

THE directors of the Baltimore Centennial Exposition of 1897 have decided to go ahead with the scheme and to push it vigorously. It is announced that $460,000 of the first $500,000 has been subscribed, and when the balance is raised it is thought that the city and State will each give $500,000 and the United States Government twice as much.

## California Irrigation.

Millions of dollars have been invested in this State in hydraulic mining ditches and canals, and in irrigating works in parts of our State purely agricultural. So many mining scenes have been depicted that by way of variety is herewith portrayed one which bears the same relation to the former that the flume or ditch does to the miner. The scene chosen by our engraver is a check drop in a branch canal in Fresno county, in the great San Joaquin valley, and is a characteristic one, showing the passage of an irrigation canal over the plains at a distance from present horticultural areas. This is a canal out on the open plain, forty miles from its headgate. The allusion shows how extended some of our irrigation enterprises are, for forty miles is not such a great distance as irrigation canals go. The dam is a check drop, put in either to arrest the current to keep it from washing its banks or for the purpose of turning water out into a shallow lateral for adjacent irrigation. Irrigation canals have these check drops in abundance, and often at quite short intervals.

The team in the background is illustrative of plains-crossing with loads of grain on the way to the shipping point. As railroads are multiplying in the San Joaquin, and as navigable canals and electric transportation are among the things of the near future, it is quite likely that these old team outfits may take their places beside the prairie schooners as memories of the early affairs of a well improved and populous region.

IRRIGATION IN THE SAN JOAQUIN VALLEY—A CHECK-DROP IN A BRANCH CANAL IN FRESNO COUNTY.

---

IT is frequently asserted that the law of supply and demand makes wages uniform all over a country, at least for some labor. But the average earnings of persons engaged in manufacturing industries show that in Colorado the average pay is $720 a year; Montana, $722; Wyoming, $768; California, $760; New York city, $550; Philadelphia, $492; Massachusetts, $494; Alabama, $376; Mississippi, $310, and North Carolina, $216. Leaving out of consideration the possible influence of the cost of living, competition, the employment of women of and children, it may be possible to explain the differences here exhibited by the fact that the principal manufactures of the South, East and West are dissimilar in kind and quality.

---

LOCOMOTIVES intended for express trains require as much "training" in their way, for fast running, as do race horses. Thus the Pennsylvania Railroad company builds its own engines, and those built for express trains are known as class P. When one of these big engines is taken out of the shops to be placed on the road, instead of putting it to the work it is intended for at once, it is run for two or three weeks on some of the local branches, in order to train it, so to speak, for faster running. By this means all the bearings and journals connected with the running gear becomes settled to their work, for, should anything about the new machine not work harmoniously, there is time to adjust the defect.

## Mines, Miners and Monopolies.

Written by J. V. EDMAN.

NUMBER I.

TO THE EDITOR:—The miners of California should and will accept nothing less than the so-called Idaho-Montana bill, substantially as introduced in Congress by Mr. Caminetti in January, 1895; the so-called compromise bill contains nothing that does not strengthen the railroad company in its present policy.

Among all the propositions for the classification of the mineral lands, the Idaho-Montana bill certainly offers the most practical, if not the most just, solution of this question, as strikingly evidenced by the late report of the Mineral Land Commissioners of the Helena district, which fully disproves the predictions of that eminent advocate of the railroad companies, Commissioner Lamoureux, who, in his letter to the Secretary of the Interior of July 30, 1894, says: "The work of a Commission under this (the Idaho-Montana) bill at best would be superficial. To examine thoroughly into the character *of each smallest legal subdivision* of the 30,000,000 acres involved, to publish lists thereof and to take testimony relative thereto, would take years of time, and would entail expense that no one can estimate—an expense which should not be charged to the United States."

If the required classification should take years of time and some millions even of money, it would be a great boon to the common people of the United States and a pillar of safety to a republican Government, so industriously undermined by the great conspiracy, which, ever since the beginning of the Civil War, has been subverting the liberties of the people by providing for the absorption and control by a privileged few of one hundred and twelve million acres of the public domain of the United States under the iniquitous land-grant system.

The people of California know too well the policy pursued by the railroad power of the State—the fraud, corruption and oppression which has marked every period in the history of the Southern Pacific and its affiliated lines; but as yet the great portion of the American people appear to be oblivious of the immense power conferred upon the railroads of the Western States and Territories, and through them on the money power of the country. This is evidenced by the inaction of Congress to enforce the obligations of the land-grant roads and the general ignorance and apathy on the subject to be met with even in the halls of Congress, as it cannot be presumed that the Huntington combination is rich enough to buy up a majority of our national legislature. So far the Acts of Congress and the rules and regulations of the General Land Office bear testimony, obvious to any close observer, that the whole land system relating to the disposal of the mineral lands of the West has been conceived and directed to prevent the acquisition of mineral lands by the individual citizen until the corporations would have

time and opportunity to absorb these lands, as well as much of the agricultural.

Commissioner Lamoureux estimates the land grants to the western railroads to be one hundred and twelve million acres—enough to furnish comfortable homes and subsistence for more than five millions of workers—and of these over twelve million acres had been patented to them up to July, 1894, since which time list after list has been approved and patented to the Southern Pacific and leased lines. Would it have been too much if the representatives of California had demanded in Congress that, pending a settlement of the obligations of the Central Pacific, all the lands granted to that road had been reserved by the Government until all the obligations by that company had been fulfilled to the letter. It would then have been impossible for the Southern Pacific to replete its corruption fund by hypothecating these lands, both actually held and prospective, to other wealthy corporations, intimately connected with the railroad companies, and thus add to the number of their partisans and active supporters in and out of Congress.

Means may yet be devised to control and recover to the General Government and to the people much of the land granted to corporations. As for the absorption of mineral lands, in direct contravention of the plain language of the land-granting acts, the time is now ripe that the American people should declare and enforce the warning, "Hereunto shall ye go, but no farther," and preserve at least thus much or thus little for the legitimate industrial activities and needs of the individual citizen, as opposed to monopolies.

The whole of our public-land system, as applied to the gold and silver-bearing regions of the Western States, may be characterized as a system to promote and perpetuate fraud and perjury, to which end many of the Acts of Congress, and especially the rules and regulations of the General Land Office, appear to be framed, or readily to adapt themselves. The onerous, costly and often vexatious and impracticable rules enforced, and which require repeated proofs by the miner, supported by a number of witnesses, being on the ground and familiar with its actualities, may be contrasted with the wholesale attestation by hired subordinates allowed to a railroad company, as attested by the rules promulgated by the Department of the Interior in July, 1894, as follows: "When the lands selected by the company are within a mineral belt, or proximate to any mining claim, the railroad company will be required to file with the local land officers an affidavit *by the land agent of the company*, which affidavit shall be attached to said list when returned, setting forth in substance that he has caused the lands mentioned to be carefully examined *by the agents and employes of the company* as to their mineral or agricultural character, and that to the best of his knowledge and belief none of the lands returned in said list are mineral lands."

What admirable simplicity and directness in this rule! The land agent lumps several thousand acres in his affidavit on knowledge and belief, and does not even have to go to the expense of hiring perjured testimony, as the individual speculator is compelled to do. The honest miner who actually works his patch of ground must prove location, occupation and valuable improvements made on every twenty-acre tract, and then often wait from two to ten years before his patent will issue. If this is the best that republican principles can do for us, the writer prefers the old Spanish mining laws and regulations or the now prevailing mineral land laws of the British colonies, vexatious as the latter may appear in some of their details.

All the railroad land grants except the mineral lands (coal and iron excepted) from their operation. What, then, is meant by the term "mineral lands," what the manifest intent of these words as used by Congress in the Acts now in force? Simple as they are, different and widely diverse interpretations have been offered us by parties directly interested, and the present definition of mineral lands, as accepted by the General Land Office, may be said to be that evolved by the united efforts of the attorneys of the combined land-grant railroads. This, in brief, may be defined to be: First, the negative evidence "that no land is mineral when any one can be found to swear that in his opinion it is agricultural land." The second or positive evidence accepted is the actual development of a mine on the land, and the production of bullion therefrom, provided always "that no one can be found to make oath that he could have made more out of the ground by raising hypothetical crops thereon." Under this delectable system some of the best mining lands of California are entered every day under the homestead and pre-emption laws, to say nothing of the railroad claims, and the area of mining ground available for the actual working miner is becoming more and more circumscribed every year until the danger is imminent that, within a decade more, or but little over half a century from the first development of gold mines in California, placer mining will cease to exist, and the further expansion of quartz mining be possible only for wealthy corporations, affiliated with, submissive to or dependent upon the controlling money power.

The true meaning and definition of the term "mineral lands" evidently is to be determined by the permanent physical character of the land, and chiefly in its topographical, mineralogical and geological relations, as determined by trained inspection and actual development, in contradistinction to the crude and wavering opinions by interested individuals or corporations. The Interior Department has, within its machinery, one division abundantly able to give its aid in classifying the mineral lands, and so far apparently not controlled by the railroads, as the General Land Office evidently is; and this is the Geological Survey of the United States, among the members of which men can be found intimately acquainted with the mineral and agricultural regions of California, and fully able to give unbiased and reliable opinions. Prominent among them, as yet actively in the field, may be mentioned Messrs. Becker, Turner and Lindgren. We have also in California many practical and working miners—men of life-long experience in all departments of mining as here practiced, and with a clear understanding of structural geology, and with that sense of perception of physical evidences pertaining to a mining region, which is innate or acquired only by long and varied experience. From their ranks accurate testimony can be had on disputed or doubtful points.

A Commission appointed mainly by the General Government, and consisting of one member of the Geological Survey, together with California miners of experience, and including also a prominent and able representative of the farmers, would be able to classify and report upon the mineral lands of California; and the same system would apply to other States and Territories. The physical features of California are so marked and prominent, and consequently the distinction between mineral and agricultural lands generally so apparent, that it would be comparatively easy to segregate the mineral lands of this State, except perhaps those of southern California.

These characteristics and their bearing upon the question at issue will be presented in another paper.

Meadow Valley, Cal., Jan. 11, 1896.

## Notes on Gold Milling in California.

NUMBER X.

By E. B. PRESTON, M. E., Field Assistant State Mining Bureau.*

The following is a description of an improved canvas plant erected and operated in Amador county, by the patentee, Mr. Gates. In this case, the pulp and waste water are conducted from the mill in a flume to the plant, and there divided into two equal streams by the insertion of an adjustable division plate in the flume. The divided pulp passes into boxes 4 feet long and 1 foot wide, and having steel screen bottoms with one-eighth and one-sixteenth inch perforations, set on a reversed grade of 6 inches to the box. The object of these screens is to prevent any chips, leaves, lint, or foreign substance from passing into the sizing-box beneath which consists of a wooden V-shaped trough, 6 feet long, 15 inches broad at the top and 2 inches in the bottom, constructed of 1½-inch boards. A piece of canvas is tacked on the bottom for packing; underneath is nailed a piece of scantling, 4 inches by 6 inches, at one end of which, reaching within 2 inches of the end of the box proper, a slot, 14 inches long and 2 inches broad, is cut: here a flattened, galvanized iron funnel ending in a 2-inch pipe, is attached. The pulp falls through the screen with some force and is considerably agitated in the separator-box. Naturally the coarser and heavier particles have a tendency to settle toward the bottom. Were the outlet there large enough, all the pulp would pass down and out. Its size of 2 inches causes the box to fill to the height of a sluice-box in the end, through which the finer pulp flows to the canvas-tables. To facilitate the separation, a device is placed in the lower end, consisting of an iron pipe, ½ inch inside diameter, connected with the main pipe above the screen, and divided into two sections, which are connected by rubber hose for ready detachment. The lower 6 inches of the iron pipe has small perforations, through which clear water is ejected, causing an agitation of the pulp. The end of the pipe is stopped with a wooden plug, easily removed. The agitation at the end of the pipe causes the fine material to be carried upward and into the sluice at the end of the separator-box. Only coarse sand passes through the bottom pipe, and on examining this with a magnifying glass, very few particles of sulphurets are discernible. This separator works well, and disposes of a lot of coarse, valueless material that would otherwise interfere with the subsequent working of the slimes on the canvas platforms. The fine pulp flowing from the top of the separator is conducted in a sluice to a broad, flat box, in which the stream is divided by partitions into ten separate currents, each terminating over a canvas-table, ten in a row. The pulp goes over a spreader made of strips of galvanized iron, ¾ inch in height, radiating from a common center to the farthest side of the table, which is 12 feet wide. These strips are nailed to an inclined board extending across the canvas-table, having an iron strip 1 inch high, fastened to the lower end, perforated or notched, with indentations one-sixteenthinch deep and 1 inch long, affording a perfect distribution. Twenty tables are arranged in two rows of ten each, covered with canvas laid crosswise and overlapping about 2 inches. These tables have a grade of 1½ inches to the foot, are 13 feet long and 12 feet wide. After receiving the flow for an hour, it is shut off from the table and a flow of clear water turned on, which in a few minutes washes away the sand, when it is also stopped; then with a hose ending in a flat nozzle, the accumulated sulphurets are washed from the canvas into a trough below, extending along the base of the entire series. In order to secure sufficient fall for this sluice, each succeeding table is set 4 inches lower than its predecessor, giving 40 inches fall on 125 feet of sluice length. Two extra tables are arranged, one at the end of each row, to take up the surplus flow during the time one of the tables is shut off, to avoid overloading, as each table already carries the proper amount of pulp. The effectiveness of the canvas tables depends on maintaining an even flow of pulp during a given time; it will not do to overload them. All the pulp that leaves the table is considered waste, and is collected in a flume, to be used a short distance off as power on an overshot wheel, by means of which the patentee runs a vanner of his own invention. This waste water is caught up again and used on a second wheel, which also runs a vanner. The sulphurets washed from the table flow through a sluice to a box outside the building, 12 feet long, 2 feet wide, and 12 inches deep, with a cross piece 2 feet from upper end, reaching within 2 inches of the top of the box. In this upper section the coarser grade of the material is retained, while the finer flows over the weir. The two grades are shoveled out separately and placed in separate V-shaped boxes, over which are perforated iron pipes, from which small streams of water trickle, gradually carrying the pulp down and passing it through sluices onto the spreaders of separate vanners. These two machines work with different motions, doing excellent work on this impalpably fine stuff. The slimes flowing from the washing-boxes beneath these vanners are conducted, with the overflow of the two compartment boxes above referred to, to two other canvas-tables, below which they are allowed to escape as waste; not that they have given up all the precious metal they carried, but because the point is reached where it is more economical to lose the remnant than to attempt to save it.

As the slimes from most of the canvas plants, as usually operated (especially where the ore crusued carries a heavy percentage of sulphurets, or has been stamped with a high discharge), are still valuable in gold, they can be conveyed to so-called slime-settlers, or tanks. These tanks, for there are generally several, are placed below the canvas platforms, and are about 2 feet deep, 2 feet wide, and 12 feet to 20 feet long; they are divided into sections of 2 feet square, by 2-inch plank set on edge, extending alternately from each side, leaving an opening 4 inches wide and 2 feet deep, causing the slime water to take a serpentine course in passing through. The tanks stand level, and the slimes, in settling, form their own grade as they enter at one end of the tank, and, passing through the successive sections, issue at a diagonally opposite point only slightly clouded. These tanks require cleaning only at long intervals.

Up to the present time, the concentrates in the California mills have been generally handled by the chlorination process, to free them from their gold, but within the last year several plants are successfully working them by the cyanide process.

The tendency in the construction of mills at the present day is to a substitution of steel for iron, where possible, and to an increase in the weight of the stamps.

A greater application of grinding and amalgamating machines, in place of or subsidiary to the stamp-mill, is also noticeable, the most popular of which will be shortly described.

For a more thorough appreciation and knowledge of the work done by mills, records should be kept, by the amalgamator, of all transactions connected with mill work, showing every item, loss of time, consumption of mercury, iron, fuel, water, amount of rock treated, etc., in addition to the records kept in the assay office. This is already being done to some extent, but such records should be kept in the small mills as thoroughly as in the large ones.

(*To be Continued.*)

* Bulletin No. 6, California State Mining Bureau.

## Chicago Mining Commissions.

H. Burkholder, LaSalle and Monroe streets, Chicago, Ill., furnishes the following section from the constitution of the new Chicago Mining Exchange and fixes the rates of commissions to be charged:

Commissions shall be charged to all non-members and paid in all transactions in the purchase or sale of stocks, the term "stocks" including stocks, bonds and securities, and the minimum rates will be as follows:

| | *Per 100 Shares.* |
|---|---|
| Stock selling at 25c and under | $ 25 |
| Stock selling at over 25c and under 50c | 50 |
| Stock selling at over 50c and under $1 | 1 00 |
| Stock selling at over $1 and under $2 | 2 00 |
| Stock selling at over $2 and under $5 | 3 00 |
| Stock selling at over $5 and under $10 | 5 00 |
| Stock selling at over $10 and under $20 | 6 25 |
| Stock selling at $20 or over | 12 50 |

## Annual Report of Precious Metals.

From JNO. J. VALENTINE, President Wells, Fargo & Co

The following is our annual report of precious metals produced in the States and Territories west of the Missouri river (including British Columbia) during 1895, which shows in the aggregate: Gold, $48,667,383; silver, $35,274,777; copper, $27,052,115; lead, $7,170,367. Total gross result, $118,164,642. The "commercial" value at which the several metals named herein have been estimated is: Silver, 65 cts. per oz.; copper, 11 cts. per lb.; and lead, $3.23 per cwt.

Allowance must always be made for probable variations from reported figures, by reason of constantly increasing facilities for transporting bullion, ores and base metals from the mines outside of the express and the difficulty of getting entirely reliable data from private sources. Estimates obtained in this way are liable to be exaggerated and are, to a considerable degree, guess work; but with some modifications on this account, made herein, the general results reached, while only approximately correct, may be accepted as the closest approximation possible under the circumstances.

| States and Territories. | Gold Dust and Bullion by Express | Gold Dust and Bullion by Other Conveyances | Silver Bullion by Express | Ores and Base Bullion by Freight | Total. |
|---|---|---|---|---|---|
| California | $10,940,400 | $3,063,617 | $157,320 | $286,575 | $14,447,912 |
| Nevada | 1,230,735 | 319,581 | 662,647 | 359,050 | 2,581,013 |
| Oregon | 1,509,785 | 150,000 | 102,645 | ..... | 1,852,430 |
| Washington | 314,817 | 35,000 | 202,650 | ..... | 552,467 |
| Alaska | ..... | 1,454,420 | ..... | 15,000 | 1,469,420 |
| Idaho | 2,521,000 | ..... | 2,723,646 | 2,182,252 | 7,426,898 |
| Montana | 1,500,000 | ..... | 9,425,000 | 23,907,500 | 37,832,500 |
| Utah | 647,405 | 704,785 | 1,110,767 | 6,753,005 | 9,222,052 |
| Colorado | 13,386,271 | ..... | 12,888,401 | 2,270,987 | 28,545,659 |
| New Mexico | 256,995 | 1,321,300 | 293,881 | 627,710 | 2,499,886 |
| Arizona | 1,206,503 | 1,230,069 | 160,019 | 4,756,185 | 7,352,776 |
| Dakota | 3,475,785 | ..... | 175,000 | 38,000 | 3,688,785 |
| Texas | ..... | ..... | 380,300 | 7,040 | 387,340 |
| Wyoming | 32,500 | ..... | 1,750 | ..... | 37,250 |
| British Columbia | 267,654 | ..... | ..... | ..... | 267,654 |
| Totals | $40,388,611 | $8,278,772 | $28,392,935 | $41,204,324 | $118,164,642 |

The gross yield for 1895, shown above, segregated, is approximately as follows:

| | | |
|---|---|---|
| Gold | 41.19 | $48,667,383 |
| Silver | 29.85 | 35,274,777 |
| Copper | 22.80 | 27,052,115 |
| Lead | 6.07 | 7,170,367 |
| Total | | $118,164,642 |

ANNUAL PRODUCTS OF LEAD, COPPER, SILVER AND GOLD IN THE STATES AND TERRITORIES WEST OF THE MISSOURI RIVER, 1870-1895.

| Year. | Production as per W. F. & Co.'s Statements (including amounts from British Columbia and West Coast of Mexico). | Product after deducting amounts from British Columbia and West Coast of Mexico. | The net products of the States and Territories west of the Missouri river, exclusive of British Columbia and West Coast of Mexico, divided, are as follows: Lead. | Copper. | Silver. | Gold. |
|---|---|---|---|---|---|---|
| 1870 | $54,000,000 | $52,150,000 | $1,080,000 | ..... | $17,320,000 | $33,750,000 |
| 1871 | 58,284,000 | 55,784,000 | 2,100,000 | ..... | 19,286,000 | 34,398,000 |
| 1872 | 62,236,959 | 60,351,824 | 2,250,000 | ..... | 19,924,429 | 38,177,395 |
| 1873 | 72,258,693 | 70,139,860 | 3,450,000 | ..... | 27,483,302 | 39,206,558 |
| 1874 | 74,401,045 | 71,965,610 | 3,800,000 | ..... | 29,689,122 | 38,466,488 |
| 1875 | 80,880,057 | 76,703,433 | 5,100,000 | ..... | 31,635,239 | 39,968,194 |
| 1876 | 90,875,173 | 87,240,850 | 5,040,000 | ..... | 39,292,924 | 42,886,935 |

| Total | $3,507,382,703 |

It will be observed that in current product—both gold and silver—Mexico shows a continued increase.

## Venezuela, Its Industry, Mining and Commerce.

Written by I. B. STORCH, M. E.

The Republic of Venezuela is one of the most beautiful tropical countries in the equatorial zone of South America, extending from 1.7° to 12° Lat. N., and situated on the southern shore of the Caribbean Sea. The climate is delightful, with the exception of the lowlands on the Rio Orinoco, near and at the coast. The interior and the mountains are blessed with the healthiest and most agreeable climate of the South American continent.

Venezuela is encircled by mountains, northwest extending the grand Sierra Madre de Merida to the height of 15,255 feet, connecting with the coast range at Barquesimeto (5495 feet) and embracing a wide plain, while southeast the Sierra Tarima, with the peak of Maraquaca (8352 feet) extending to the east and forming the highlands of Guiana, the country in dispute.

The mountains are partly thickly covered with wood and extensive, impenetrable forests, with luxuriant, lively-green foliage of all shading, numberless palm trees, shrubbery, plants, flowers with blossoms of all tints, size and fragrance, blooming all year around, are covering the shores of the Orinoco.

The savanas in the interior—a grass-land with sparingly scattered trees—resemble in the springtime the northern meadows; towards the end of the dry season looking more like thinly-sowed grain fields.

The llanos are endless plains, bare of trees, partly deserts and partly inundated by the equinoxial storms.

The principal river of Venezuela is the Orinoco, with its tributaries, the Apure, Meta, Guaviari, Cusiquaire, then the Rio Cuyuni (Esequibo).

The large lake, Maracaybo, is connected with the gulf of Venezuela; the lake Valenzia is near the seashore, and many smaller lakes are to be found in the interior.

The climate is tropital, with two seasons, the dry and the rainy season (from April to October). The coast is very hot, and so are the lowlands of the Orinoco. The higher region is mild and healthy; the average temperature never exceeds 60° F. Frequent and sometimes destructive earthquakes are unwelcome visitors.

The republic consists of the federal district of Caracas, the State capital, and nine States: Bermudez, Bolivar, Carabolo, Faleon, Lara, Los Andes, Miranda, Zamora, Zulia. besides the Territores, Amazonas, Colon, Delta, Goajara and Yurnary. The area is 566,159 square miles, with a population of 2,121,988 (fifty-two per cent of which are females - census of 1891), a mixture of negroes, Indians, whites and mulattoes. The colored race is predominant. Full-blood Indians inhabit the Territories of Goajara and Guiana. According to the census of 1892, there were 34,916 foreigners in Venezuela—11,544 Spanish, 4041 English, 3237 Italian, 3206 Dutch, 2186 French, 1171 German, 204 Danish, 8729 Colombian, 179 Americans (United States).

The agricultural productions include principally coffee, cacao, sugarcane, cotton, tobacco, indigo, maiz, cassava, bananas, potatoes, wheat and various medical herbs and roots (remember the Angostura bitters). Venezuela raises a large number of cattle, horses, mules, burros, hogs, sheep and goats. The general industry is still in its infancy, but begins now gradually to develop.

The mining industry is rather neglected and is the question of future times. The annual production of gold averages about 180,000 ounces; copper, 30,000 tons. The salinas of Araya supply the country with fine salt, while natrium is produced at the Laguna Luganilla. Guano-phosphate is plentiful on the island of Orchilla. Extensive coal fields are awaiting their development, save a very few operated on a small scale. The large gold and copper mines are operated with English and German capital, and they have paid handsome divideuds for years. Venezuela is supposed to be extremely rich in minerals and mineral-bearing veins, but prospecting is very difficult on account of the thick underwood, the impenetrable bushes of the gigantic tropical vegetation and the entangled network of milliardes of roots, covering entirely the formation and croppings. There is no chance for miners getting work. The mint is in Caracas, and the standard coin is the "bolivar," about twenty cents U. S.

The El Dorado of Venezuela are the rich gold fields of Caratal, 154 miles southeast of Angostura (Bolivar) on the Rio Yurnary, a tributary of the Orinoco. Bolivar is the old capital city of the Venezuelan Guiana. This department is formed of the State of Bolivar, the Territory of Yurnary and part of the Territories Alto Orinoco and Amazonas of the united republic of Venezuela. The area of Guiana is calculated at about 360,000 square miles, with 90,000 people. The largest part of the territory is inhabited by free and independent Indians, about 20,000, and they are scattered all over the country.

Venezuela is governed by a President and eight ministers, who are elected for two years; also by a federal counselor, who is elected by the Congress. The Congress consists of twenty-seven members, no member being under the age of thirty years, and all born in the country. There are three from each State. The Legislature consists of fifty-seven members, none being under twenty-one years old. Both of these bodies are elected by the people for four years. The President and ministers are elected by the executive corporation. Every State has equal regulations, laws and rights, and the Federal Supreme Court is in the capital city of Caracas, the seat of the government.

Fruitvale, Cal., Jan. 13th, 1896.

## Native Labor in South African Gold Mines.

Discussing the question of "Labor and the Gold Industry," the South African *Mining Journal* says that 45,000 natives are at present working in the gold mines on the Rand, another 5,000 in the coal mines at Boksburg, another 15,000 in Johannesburg and along the reef employed in general work, the total being 65,000 men for the Rand alone. Other mining centers employ 10,000 men, and 25,000 must be at work among the Boer farmers, making the present total labor demand of the Transvaal equal to 100,000 men. * * * * To insure prosperity, the Rand has to face the difficulty created by the fact that wages must be reduced during the next five years in the face of a trebled demand.

The native population of the Transvaal is estimated at 700,000; but, placing it as high as 800,000, and allowing one able-bodied man for every six inhabitants, a total available supply of 130,000 laborers is arrived at as the approximate maximum to be obtained from within the State borders if every man were constantly employed. But, as only a small fraction of this number is at work at any one time, it is clear that only by a wholesale importation of labor can any solution of the difficulty be reasonably anticipated.

LAST Tuesday the Geographical Society elected its officers as follows: President, Professor George Davidson; vice-president, Ralph C. Harrison; second vice-president Irving M. Scott; third vice-president, Charles L. Laylor; recording secretary, John Partridge; home corresponding secretary, Jeremiah Lynch; foreign corresponding secretary, Mark Sheldon; directors—Professor George Davidson, Charles L. Taylor, Harry Durbrow, John Partridge, E. J. Bowen, Louis L. Nelson and John Dolbeer; counselors—Hon. Ralph C. Harrison, Hon. Jeremiah Lynch, William Hood, Charles Goodall, Mark Sheldon, Dr. F. Stevens Cook, James F. Houghton, Gustave Niebaum, Senator George C. Perkins, Henry Lund, Irving M. Scott, Adolph Sutro.

## Hints in Regard to Tellurides.

Written by DR. RICHARD PEARCE, Manager Boston and Colorado Smelting Co.

At the present time, owing to the discovery of gold in Cripple Creek in combination with tellurium, prospectors are on the search for similar conditions in other districts, and it has occurred to me that a few hints in regard to tellurides might be of some value.

Tellurides proper are rarely found to exist near the surface of lodes that may contain them in depth. This is due to the fact that tellurium is susceptible to oxidizing action like iron pyrites and other minerals when they are exposed to weathering influences.

This weathering action, in the case of tellurides, has the effect of converting the tellurium into an oxidized form, which combines with oxide of iron and seldom shows any evidence of its existence, except in rare cases, when the ore is exceedingly rich, and then the oxide of tellurium appears as a yellowish-brown stain on the rock.

The gold resulting from the oxididing change occurs as a brownish powder, and does not possess the properties of gold found under other conditions. It has little or no luster, and is so light in weight and spongy that the ordinary process of panning fails in most instances to indicate its existence. The ordinary method of assay will, however, prove its presence, and this should be done by some assayer who is not only qualified by experience to make the assay, but whose honesty is beyond question. Prospectors will do well to give a wide berth to the quack assayer, who has some particular method of his own, or what he is pleased to call a "chemical analysis" process, which he claims is the only true method for determining the value of an ore.

These frauds are scattered all over the country and are often the cause of no little disappointment to the honest prospector. It sometimes happens that a prospector is so far away from a reliable assayer that it is impossible for him to ascertain whether the ore contains gold or not when the presence of tellurium is suspected.

A very simple test, requiring no particular skill, can be used to determine whether or not tellurium is present in an oxidized form; for if it is found that tellurium is present, it is pretty safe to presume that gold accompanies it. This test, which I will give here, is one which I recommended in a paper read before the Colorado Scientific Society some two years ago, and was the result of some investigations on oxidized Cripple Creek ores.

Fifty grammes of the fine pulp ore are treated with dilute hydrochloric acid, consisting of equal parts of acid and water. The mixture is heated to boiling and filtered, and to the filtrate is added a solution of stannous chloride. The tellurium, if present, will immediately be precipitated in a black flocculent form as metallic tellurium; if its quantity is small it is best to heat the solution, which aids the separation. It must, however, be remembered that this test is only applicable to ores which contain the tellurium in an oxidized form, and is of no value in other cases.

Below the water line the tellurides proper occur, and in Cripple Creek they are represented by the minerals sylvanite and calaverite. Sylvanite is as white and lustrous as pure silver, and contains, when pure, about twenty-seven per cent gold. Calaverite has a slight yellow appearance, resembling somewhat a pale variety of iron pyrites, and contains about forty per cent of gold.

The presence of tellurium does not in every case prove the existence of gold, but I think it may be said to be the rule at Cripple Creek. Boulder county has produced what is termed native tellurium and telluride of lead (altaite) which contain no gold whatever, and I have known of the occurrence of telluride of bismuth (tetradymite) in Montana containing little or no gold, but these examples are rare. The occurrence of fluorite of a purple or amythestine color, so characteristic of Cripple Creek ores, may be regarded as a favorable indication of the coexistence of tellurides. This peculiar association is well marked in other districts, such as Boulder county, Colorado, and in the tellurium gold ores of South Dakota, so that it indicates some sort of close kinship between the two minerals, or rather that they owe their existence to some one common origin.

The distribution of tellurium is infinitely more extensive than is generally supposed, but its importance as a mineralizer of gold has not been recognized to any great extent in connection with important gold deposits.

Careful investigation has proved its existence in localities where its presence had not hitherto been suspected. Recent examinations have shown that the gold deposits in the so-called Potsdam sandstone of South Dakota, and that of the famous Mercur mine in Utah, owe their importance to gold in combination with tellurium, so that this element which, until recently, has been regarded as occurring in few localities may claim a far more intimate relationship with gold than was ever supposed.

## Geological Maps.

A series of maps is in progress under the auspices of the United States Geological Survey the use of which cannot fail to exert an important influence upon all industries in the least dependent upon the treasures of the earth. When the series is completed, which will be some considerable time in the future, every district in the entire country will be covered. The following description gives an adequate idea of the maps and suggests some of the uses to which they may be put by business men.

As the maps are now appearing, each district under consideration is represented by several map sheets, and the whole is called a folio, is 19x22 inches in size, and is bound in heavy manila paper. So far the MINING AND SCIENTIFIC PRESS has received three of those folios. On the cover is the name of the map, as the Jackson or the Livingston folio, the sheet being named after some feature shown upon it. Inside the cover is an explanation, in clear and simple language, of the geological map of the United States, of which the folio forms one sheet. This is followed by a description of the geography, geology and mineral resources or soils represented in the particular sheet, and this account, written for all, is given in untechnical language as far as possible. The descriptions are specially prepared for the public, and there is no doubt that these folios may be used to advantage in geographical school instruction in the regions to which they apply.

At the Geographical Congress in London recently several distinguished geographers expressed their opinion that our topographical map sheets are the finest of their class produced by any nation. All water features are in blue, the hills are in brown, contour lines show topographic forms and heights, and names, roads, towns, and so on are in black. The next sheet is the same basal map overprinted with the geological colors, showing the surface extent and position in the embraced area of the various rock formations. This sheet is entitled Aerial Geology, and the next map of the same area is called Economic Geology, and differs from the preceding chiefly in the fact that the rock masses, which are of special importance from their yield of iron, gold, etc., are printed in strong, and the other rocks in subdued, colors. These two maps show the surface only, but the next sheet, entitled Structure Sections, takes the map student down among the under formations, perhaps a half mile, more or less, and shows him what the geologists believe they have learned about this deeper lying portion of the earth's crust. The last sheet of the folio is a diagram bearing the title Columnar Sections, and illustrating the geological age and thickness of the rock masses under investigation.

For the present the edition of these folios is 5000 copies. The price of those thus far issued is 25 to 50 cents a folio.

# Mechanical Progress.

## The Art of Assaying.

Written by PROF. E. M. WADE.

The art of assaying is of very ancient origin. Properly, the term is applied to the quantitative determination of the metallic elements by means of fire, fluxes and crucibles—process called commonly the "dry assay" in contradistinction to the methods with the use of acids and other liquid ingredients. The term now is often used to designate either process—"wet" or "dry." The subject of this article will be that of the dry assay. The metals now most commonly determined by this method are gold, silver and lead, the other elements being most satisfactorily determined by means of wet methods, or a combination of the two. We will now confine the subject further to that of the gold and silver assay. The process in general consists in "fluxing" off the gangue matter and base elements with borax, soda, niter, litharge and other substances, and collecting the precious metals alloyed with a small button of lead, and then burning off the lead in a "cupel." The employment of any or all of the above substances, and the quantity, depends upon the nature of the ore under treatment. Here comes in the judgment and experience of the assayer. These substances are chiefly employed in the crucible process, which is most convenient for the gold assay, a large quantity of ore being capable of treatment in one operation. Such is often necessary on account of the relatively minute quantity of gold extracted, sometimes almost invisible, and its uneven distribution through the rock. The crucible is a small pot made of fireclay. The ore is weighed out—generally about an ounce—mixed with the fluxes and poured into the crucible. The crucible and contents are then placed in a furnace and heated until thoroughly fluid, and the lead, which has been reduced by charcoal, flour or other reducing agent previously added, settles to the bottom with the gold and silver. A chemical union takes place between the soda, borax and other fluxes and the silica and base elements of the ore, making a fusible slag or glass. When sufficiently melted, the pot is taken out and the contents cooled. The button of lead is broken out, hammered and cleaned and "cupelled." The cupellation consists in oxidizing off the lead in the aforesaid cupel—a small, round cup, one inch more or less in diameter and as tall, made of bone ash, into which the lead button is placed. The cupel is previously placed in a clay muffle heated to almost a white heat, and kept very hot during the operation. The lead burns away and is absorbed by the cupel, while the gold and silver are left in the shape of a small button on the bottom. The button is weighed, the silver dissolved out by means of nitric acid, and then the gold weighed. The difference in weights gives the silver. Silver is most often assayed by the "scorification" process. The ore is mixed with granulated metallic lead and a little borax in a shallow clay cup and heated very high in the muffle. The lead is oxidized to litharge partly, which fluxes off the gangue matter, the gold and silver being absorbed by the metallic lead. After the ore is thoroughly fluid, and the remaining lead is of convenient size, the contents are poured out into an iron mould and the lead button cupelled. Both metals may be assayed by either process, but one is more suited to certain kinds of ores than the other.

A NEW way of getting rid of scale in a boiler is credited by a Boston paper to an engineer in that city. The scale came from the use of well water. The feed pipe enters the front of the boiler just about the water line, and has slots cut in it about an eighth of an inch wide, instead of the ordinary spraying method of distributing the water, and surrounding the feed pipes in the larger pipe, about six inches in diameter and cut away at the top; the feed water enters the boiler and discharges through the slot in the feed, depositing all the foreign matter in this water into the catch pipe instead of into the boiler—the success of the plan depending upon having a high temperature of feed at about the boiling point, when the solids held in suspension of or solution in water will be deposited.

## An Attachment to Traction Engines.

Steam engines intended to run threshing machines, hoist logs on to cars and do much other work while stationary are often so constructed that they can propel themselves from place to place. To a certain limited extent such locomotives have been used to draw plows and harvesting machinery, but their chief application is to the purposes first indicated. In traveling from place to place, however, traction engines are often compelled to run over rather rough land or roads; and as they are heavier than ordinary vehicles, the difficulties thus presented are sometimes hard to surmount. It is customary to apply the driving power only to the rear wheels. Joel Mosiman of Falls City, Neb., thinks that, if the forward wheels also could be made to draw, several advantages would be secured. The engine would be more nearly in the condition of a horse having calks on all four shoes instead of on his hind feet merely, and therefore could get along better. Furthermore, he expects to divide the wear and strain and make the machine last longer. Still another desirable result would be increased safety and convenience in crossing bridges. He says he has devised a way of transmitting power from the rear to the front wheels. Whether he gains enough to offset the waste of power which always results from the use of gearing, and whether any better method of accomplishing the object can be found, are still unsettled questions.

AT a recent meeting of the Verein fur Eisenbahnkunde a paper of considerable interest was read by Herr Boedecker on "a means for the prevention of noise caused by trains in passing over iron railway bridges." The author had made a number of experiments, all of which proved more or less unsuccessful; but in the end a final and effective method was found, which consists of a decking of one and one-quarter-inch planks between the cross-girders, resting on three-inch timbers laid on the bottom flanges. On the planks a double layer of felt (Papplage) is laid, which is fixed to the vertical web of the cross-girder; at the connections with the girder a timber cover-joint is placed on the felt, and two hooked bolts connect the whole firmly to the bottom flange of the cross-girder. A depth of four inches of slag gravel covers the decking, and the decking is inclined towards the center of the bridge, small tubes being inserted through the decking connected to a suspended gutter for drainage purposes. Great care is taken that the felt is fixed accurately to the girders and drainage tubes, and an arrangement is made by means of which only water and no gravel can pass through into the gutter. A layer of felt is also laid between the planks and the timbers they rest upon, and the ironwork in contact with the decking and ballast is well asphalted. The whole decking weighs 600 pounds per lineal yard for a single-line bridge, eleven feet in width, and costs 11.15d per square foot. The result of this means for preventing noise has been so satisfactory that other bridges are being treated in the same manner. The decking has, moreover, proved watertight.

THE Schenectady Locomotive Works are using for certain parts of their

work what is called "steeled iron," being a mixture of 70 per cent good iron and 30 per cent steel. The castings obtained are claimed to be about 25 per cent stronger than ordinary cast iron.

*Stahl und Eisen* describes a new method to protect iron and steel against rust, for which a patent has been issued to the Elberfeld Paint Works, formerly Friedr. Bayer & Co. The iron or steel is sponged with a solution of ferro-cyanic acid in connection with a strong acid in watery solution, in cold condition. Hereby a bi-muriatic of iron is formed, which protects the iron effectively against rust. Iron, thus treated, can be provided with a coat of any kind of oil paint.

# Electrical Progress.

### Have We Too Many Electricians?

The great development of electrical interests, telephone, lighting and railway, during the last fifteen years, has naturally created a need for the services of men especially educated in a branch of science that had only a few devotees before the present era. With commendable enterprise, a large number of students in our technical schools gave electricity particular attention, and the schools themselves made careful provision for this demand. Nearly two years ago, however, the question was asked in print whether or not our colleges were turning out rather more electrical engineers than the business world required. Among those who were then inclined to answer that query affirmatively was Henry Floy, who returns to the subject in the current issue of *The Engineering Magazine*. He says that late in the month of September last he sent letters of inquiry to the young men who were graduated in the summer preceding from Cornell and Lehigh universities and the Massachusetts Institute of Technology. There were 260 in all. Replies were received from nearly half of the graduates, and of these about three-fourths had already obtained employment. Of those who studied civil engineering and who sent replies, 87 per cent found engagements in their chosen profession; while the proportion for mechanical engineering was 71.4 per cent, and for electrical engineering, 65.3. In some instances young electricians secured employment only after they had betrayed a knowledge of German, shorthand or something else likely to be of use in business. On averaging up the hours of labor and the weekly pay, it was found that these three classes of young men made their start in life in the following manner: Students of electricity, $10.64 cents per week, working 8 hours and 54 minutes per day; of mechanical science, $13.52, and 8 hours 56 minutes a day; of surveying, $13.27, and 8 hours 27 minutes. Mr. Floy interprets these facts to mean that he was right when, in 1884, he hinted that the profession of electrical engineering was in danger of becoming overstocked.

### Telephone Weather Bulletins.

An important step has been taken in the organization of a supplementary weather warning service by means of the telephone, and a plan is now being proposed for affording to a large number of communities the advantages of the new scheme. In New York the local telephone company has placed at the service of the chief of the weather signalling department a telephone to be used only in giving special information of weather forecasts to the general public. Anyone can call for answers to special questions at any time and be sure of an immediate reply. Moreover, any subscriber who wishes to have all important weather news can send his name to the telephone company and he will thereafter be telephoned by them whenever any marked change is expected. These special warnings, all of which are to be sent to the office of the telephone company, and from there to the subscribers wishing to receive them, include all heavy storms, cold waves, warm waves, sleet and storms, etc. This movement for bringing the weather reports more within the reach of the general public has the strong support of the chief of the Weather Bureau at Washington and he has written to all the principal cities urging the making of the necessary arrangements. In this way the country will be practically covered.

One of the most important changes now going on in electric railway work is the substitution of mechanical or automatic power brakes for the crude hand brakes that depend upon the muscle of the motorman. All the progressive street car lines are evincing a preference for brakes that eliminate the factor of human power and endurance, and are rapidly substituting air brakes, the air for which is compressed by the car itself. There are also one or two forms of magnetic brakes, and a new form is that of a hydraulic brake. It is worthy of note that until recently street railway men had a prejudice against power brakes on the score of their causing flat wheels. Investigation shows that the truth is exactly opposite, and that the quicker the brake is applied the less the flattening effect. The hand brake, working with comparative slowness and with less facility, tends, it seems, to make the wheels skid and flatten. Strangely enough, outside this country there is very little public worry on the subject of fenders, but the demand for power brakes almost everywhere takes the form of a government or municipal regulation. It is believed that American opinion will also reach this point in time, no matter how good the fenders may prove to be. Another modification of street car practice is expected in the adoption of more musical gongs. The prevalent types not only deafen the passers-by, but use up the energy of the motormen and jar their nervous systems. It has also been predicted that the big, heavy lever handles now familiar on the cars will disappear and that the men will be seen controlling the movements of the car by a small lever or even by a simple unobtrusive push-button.

Every new development of electricity adds to the demand for copper, but it is only of late that in telegraphy a very large use has been found for the metal, as the majority of the circuits hitherto have been of iron wire. An instance of a new demand for the metal which had hitherto been hardly suspected is found in the last report of the Western Union Telegraph Company. It is there stated that the company, during the year ending June, 1895, added to its wire lines a net length of 11,859 miles, and that over 10,000 miles of the new wire is of copper. Further, the company has adopted the policy of replacing all defective iron wires with copper, the intention being to use that metal alone on all the principal lines hereafter. The advantages of saving in weight, increased capacity for electrical transmission and diminished liability to interruption from atmospheric conditions, are sufficient to make the copper wires more economical in the end, notwithstanding their greater first cost. The decision has been assisted, also, by the fact that the improvements in processes for drawing copper wire has enabled makers to furnish material well adapted for telegraphic use. The size of copper used for telegraph lines is generally No. 9 or 10 B. and S., weighing about 199 pounds to the mile. This would require, for 10,000 miles, about 760 long tons of copper—an amount not so important in itself, but as indicating a tendency to increased demand.

Like San Francisco, Chicago is extending its electric lines in every possible direction. Right of way is being secured by the Chicago and Wisconsin Inland Lake Railway for a system of electric lines to connect Chicago with the Wisconsin lakes. The capital stock is $10,000,000; 265 miles of track are to be built and laid with 90-pound rails.

# Practical Information.

### A Chance for Young Engineers.

If Commodore Melville's bill now before the Senate receives the approval of Congress, ambitious young engineers in civil life have a new career in view which they may feel is worth striving for. There are not nearly enough naval engineers in the service now, and the Naval School at Annapolis does not furnish enough, and the bill proposes to make it possible to supply the deficiency by drawing on the various scientific schools and colleges in the country.

The bill provides for an increase of the corps to 300 commissioned officers. The rank and titles of the line officers are asked for. The engineers ask that their chief of bureau be known as the Naval Director-General of Engineering and that he shall have the rank of Rear Admiral. To relieve him of the duties which are comprised in his work it is proposed that he shall have two Assistant Inspector Generals of Engineering, who shall rank as Commodores. The engineers ask that they have command of their department, subject to the authority of the commanding officer alone, and a naval engineering experimental school is suggested, which the engineers believe should be established at New London.

Those colleges which are to establish a course of marine engineering satisfactory to the Secretary of the Navy shall be empowered to graduate men who shall be appointed cadet engineers in the naval service. These young men will be sent to sea and to some post-graduate school of instruction for two years and then undergo competition with the Naval Academy graduates for commissions in the Navy. A radical change is suggested in the manner of appointing the cadets of the engineering branch at the Naval Academy. As there seems a disinclination on the part of these young men to choose the engineering profession, it is proposed that the appointment of naval engineering cadets be vested in the Senators of the several States, the delegates from the Territories and four appointments at large by the President, it being compulsory to appoint one resident of the District of Columbia. As the Senators would have an appointment every four years, it would give a class of cadet engineers numbering about twenty-four annually. The general sprit of this bill is to give the engineer his proper status on board war vessels.

### Pitting in Steam Boilers.

It has long been well known that very pure and soft feed water may, under certain conditions, be dangerous to boilers. The plates subjected to this form of corrosion have sometimes almost exactly conical pits, but usually the form of the pits is spherical. While this corrosion is going on the pit is filled, sometimes with a brown, sometimes with a yellow or red powder. Since the volume of this powder is greater than that of the metal from which it is derived, it forms a rounded elevation above the surface of the plate, which is often covered with a tough skin. In one case the analysis of the powder gave the following percentage composition: Oxides of iron 86.26; water 0.59; fats and organic substances, 6.29; calcium salts, 4.52; silica, alumina, etc. 2.34. In another case the skin had the following composition: Calcium carbonate, 28.0; magnesium carbonate, 8.7; calcium sulphate, 12.8; silica, 8.2; oxides of iron, 32.2.

The depth of the pitting varies; sometimes the corrosion quite pierces the plate. This corrosion is found generally in places where the circulation is feeble—in boilers lying idle and which have not been completely emptied; in empty boilers in connection with neighboring boilers when the stop valve is not perfectly tight, and steam even in small quantities is allowed to enter; but seldom on plates which are constantly below the water level.

Pure feed water which has been long boiled in order to expel the dissolved gases is harmless. The experiments of Messrs. Scheurer-Kestner and Meunier-Dollfus show that the corrosion is due to the dissolved gases, of which oxygen and carbonic acid are the most prejudicial. Professor Grace Calvert has shown that iron is not attacked by dry oxygen and corbonic acid, nor by moist carbonic acid, weakly by most oxygen, but is rapidly oxidized by a mixture of moist oxygen and carbonic acid. It seems that the greater the proportion of carbon in metal, the better it can resist this corrosion; wrought iron corrodes easier than cast iron.

Certain substances — soda, potash, borax—added to the water diminish the dangerous property. As regards the influence of the temperature of feed water, it may be mentioned that where a feed heater is used the corrosion of the feed heater is either very small or non-existent, while the boiler is nearly always free from corrosion.

### The Trans-Siberian Railway.

Regarding the new trans-Siberian railway, the Russian Government hopes to have the line completed and open for traffic in 1900. Engineering works of vast magnitude must be constructed, including bridges for spanning three of the greatest rivers in the world—the Obi, Yenise and Amoor. The most troublesome task will be to get around the south end of Lake Baikal. That great sheet of water is 350 miles long, comparatively narrow and very deep and lies in the midst of a high plateau. It is surrounded by mountains, over which the road will have to pass. The highest point is 3600 feet above the sea level, near Sheeta, a considerable distance east of the lake.

The line will be 6700 miles long. It starts at Chelabinsk, on the western edge of Siberia. At that point it connects with the European system of railways in a direct line to St. Petersburg, by way of Moscow. What may be termed the first section of the road extending east from Chelabinsk to Omsk—a distance of 500 miles—is already practically finished, and will be opened for before the end of this year.

From Omsk to Crasnoiarsk is a distance of 800 miles. The road joining those two points is built—that is to say, the embankments are constructed, the cuts are made and the rails are laid, but there are no bridges yet. This section will be opened for the running of trains in 1896. From Crasnoiarsk to Irkutsk is a distance of 700 miles. That section will be finished and in running order in 1896. This will carry the road nearly to Lake Baikal.

Notwithstanding the difficulty and expense attending the transportation of material by water all the way from Europe, a beginning has been made in the construction of the railway from the Pacific coast end—the Russian port of Vladivostock, on the sea of Japan. From that point northward to Graska, about 200 miles, the road is built and in running order, and from thence it is being carried forward as fast as is practicable.

On the eastern portion of the line the labor of convict exiles will be employed to a considerable extent, but not so elsewhere. About 25,000 men are now at work on the railway. The railway and everything in connection with it is under the control of a Government Commission, the president of which is the Czarowitz.

A contrivance for quickly stopping machinery—as in case some person is being drawn between cogs or rollers—has been devised by a French electrician. On touching one of a series of push-buttons placed at convenient points, the power is shut off and a powerful brake is applied to fly-wheels. A twenty horse power engine, working at ninety revolutions, was stopped in two-thirds of a second.

The *Railway Engineering and Mechanic* states that careful measurements taken on a steamer in heavy weather showed that the propeller shaft was at times sprung out of line 1¼ inches in a length of 112 feet. Measurements on deck showed the same amount of deflection. The ship was stiffened, and the shafting gave no further trouble.

# Mining Summary.

## CALIFORNIA.

### Amador.

THE GOVER MINE.—*Record*: Supt. C. E. Purrington of the Gover mine has returned from San Francisco and has put a number of men at work at the mine. Additional machinery is on the road, and the mine is running in full blast. The mill will start Monday.

THE ONEIDA MINE.—At the Oneida mine a force of carpenters is employed and the buildings will soon be ready for occupancy. The company recently closed a contract with P. A. Buell & Co. of Stockton for 125,000 feet of lumber. Machinery for the hoisting plant has also been ordered and will soon be delivered on the ground.

SUTTER CREEK.—*Record*: The present operators of the Mechanics mine at Sutter Creek have paid $2000 on the purchase price and intend to develop the property as soon as possible to a paying proposition. They have purchased and hauled the ten-stamp mill of the Hardenburg to the property and will erect it immediately.

HOME.—Mr. Roberts, who has organized a company to operate the Forest Home ranch of John Graham, is superintending the installation of a plant for hydraulic purposes, and has contracted for water from the old Haywards ditch which will be taken up by an 18-inch pipe line from a point two and a quarter miles east of the ground the company will operate. They already have a restraining dam constructed, and as soon as water is gotten through the pipe, the work of tearing down the gravel banks will be commenced in earnest. After the water is restrained and settled, it is to be conducted down the country to the Holsinger place and again used there for the purpose of ground-sluicing in some rich gravel deposits. This work is being prosecuted by Los Angeles capital.

BAY STATE.—Ever since the Bay State people commenced to mill rock and work toward the west of their mine, the owner of the adjoining property west has contended that the managers of the mine were trespassing on his property. This week surveyors were locating the lines of the two properties.

### Butte.

D. W. Smith of the Golden Feather mine is repairing the Miocene ditch through Morris ravine.

The tunnel of the Gold Bank mine, at Forbestown, has reached the quartz lode, which is larger and richer than where worked above. The tunnel is 1200 feet in length and strikes the lode at a depth of 2400 feet below the level of the surface.

The Durbeck Mining Company has control of the old Osgood property and considerable machinery is being placed there. The object of the company is asserted to be to obtain control of the entire mining interests of Bangor and conduct their operations on a large scale.

### Calaveras.

WORK TO START.—*Citizen*: All the machinery for the Donnallan mine is now in position and ready to start. The track is being built and will no doubt be completed by Monday. Mr. Hackett says there is now nothing more to do about the grounds except to start the work of development, and this will commence about the middle of next week.

AROUND MURPHYS.—New Year's eve saw a great influx of those volatile beings known as the midnight mine jumpers; nearly every mine in the vicinity has been peremptorily gobbled, and the mining notices are thick throughout the woods. All the mining laws in the land have been cussed or discussed until it will now be useless for Congress to pass any act relating to the mineral sections. Miners here believe that the labor required by law must be done and the affidavits filed before the close of the year, to comply with the statutes. Others just as firmly and heroically maintain that if labor be commenced on the last day of the year they will have thirty days to complete their labor and come within the requirements of the law. Be this as it may, some of the latter contestants will have an opportunity to test their theories in the courts, as many of their claims have been relocated by other persons. The discussion of "midnight jumpers" brings out occasionally some funny stories, and one told a few evenings ago was as follows: "During the rich mine excitement in Tuolumne county a few years ago, the time for relocation came around. An enthusiastic miner swam the raging Stanislaus, in waters as cold as ice, and posted a notice about as follows upon coveted property: 'NOTICE.—I, ———, the undersigned, hereby locate and claim 1500 feet of this leg running 750 feet up the hill to a black oak tree with a lump on its butt.'" Another instance is that of a heroic location writer who sat himself down and said he claimed "1500 feet of this lode east, 1500 feet west, 750 feet south and 750 feet north, and he intended to hold the same and work it according to law." The mines of note near Murphys that have been reported jumped are the Mayflower, Beatrice, Robles, and the quartz mine near the toll gate. These are only a few out of many that bear the patriotic inscription of miners within a few miles of town.

### El Dorado.

(Special correspondence).—A shaft was started last week on property to be known as the Live Oak mine. This is an extension of the Larkin, upon which the work is showing gratifying results. Both properties are operated by San Francisco parties.

The success following the deviation from ideas of forty years ago is showing itself in the Big Canyon, the Taylor and the Grand Victory to a great degree. These were all low-grade propositions when first opened, but they are rapidly growing rich in the quality and abundance of ore as depth is attained.

It may be curious to note that seven years ago mines in Tuolumne county, after several expensive ventures, were in ill repute. Three years ago Mariposa shared a like fate. To-day's investments in those counties need no comment. It is said that a funny story was published in an interview with Mr. Nevills, that the mother lode did not extend north of the Cosumnes river; yet at present writing it is well known what the old Springfield in this county produced. To-day, the Church mine, another mother lode property, and the Gentle Annie likewise are a strong refutation. History is beginning to repeat itself in El Dorado county. The number of capitalists turning their attention in this direction and actually beginning development work shows that faith in El Dorado's possibilities is returning, and perseverance without fear and no squeamishness about investing capital is developing the fact to a certainty that gold is here and will be unearthed.

Placerville, Jan. 13, '96.

### Mariposa.

HORNITOS MINES.—*Gazette*: The Dorse or Brooks mine, adjoining Quartz mountain, is doing considerable development work. The Dorse is being operated by Chas. E. Stuart of Piqua, Ohio. J. Sullivan is superintendent. Machinery is to be erected.

R. W. Barcroft's Enterprise mine is reported to be sold shortly. It is in good running order.

### Mono.

THE STANDARD'S NEW CYANIDE.—*Mining Index*: The material to be used in the construction of the Standard Company's additional cyanide plant is at hand, and the plans are being prepared by Andrew Smith, who will supervise the work. The new plant will be located about half way between Blanchard's station and the Wayner place, at a point near where a bend in the canyon has banked up a large quantity of tailings. It is intended that the plant shall be in operation by May 1st.

COPPER MOUNTAIN.—Supt. Jones is pushing work steadily at Copper Mountain and will have something to show for it in the spring, when he will have the ground pretty thoroughly opened and ready for any kind of a mill proposition that may be decided upon. At present a forty-stamp plant is being calculated on, to be built just below the mouth of the lower tunnel.

### Napa.

QUICKSILVER SHIPMENTS.—The number of flasks of quicksilver shipped from the various mines during December, as reported by the station agent at Calistoga, is: Napa Consolidated, 475; Ætna Consolidated, 305; Great Western, 255; Mirabel, 235; Sulphur Bank, 634; total, 1954 flasks, making an increase of 380 flasks over the November shipment. The total shipment for '95 was 1,771,400 pounds, against 1,617,500 pounds for 1894.

### Nevada.

PROSPECTS WELL.—Hugh Dundon, superintendent of the Live Yankee drift gravel mine near Graniteville, informed a *Transcript* reporter that they have crossed the channel and have started to run up-stream in the channel. The gravel prospects well all the way. The tunnel is in 700 feet.

MILL STARTED UP.—*Union*: Superintendent Dennis on Thursday started up fifteen stamps at the Mountaineer mill and they will be kept running day and night. About twenty men are employed on a shift at the mine now, and the water has all been pumped out. The prospects are very good.

The *Herald* hears that the Oak Tree mine, at Maybert, has a new ledge in the 500 level that is eight feet thick.

*Telegraph*: A large ledge has been located and the claim named the Western Light. The company will be called the Mammoth Gold and Silver Mining Company. The claims under its management are the Belle of California, the Colorado Central and the Western Light. The ledge averages from 300 to 500 feet in width and has been traced a distance of thirty-five miles through Nevada and Yuba counties, and is the same lode as the Boss mine near San Juan. Frank Wright, who traced the ledge, is sure that he has found the mother lode.

### Placer.

RISING SUN MINE.—*Sentinel*: A bedrock tunnel has been started at the Rising Sun mine, one mile west of Colfax, which will tap the mine at about the 500-foot level. The starting point is near Bear and it will require about 1800 feet of tunneling to tap the old works. If the present tunnel is completed it will be the key to the successful working of that valuable property. The Rising Sun has produced hundreds of thousands of dollars worth of gold bullion in the past. It was worked through a shaft to the depth of 900 feet. W. H. Thomas, of Colfax, has a contract to run 200 feet of the tunnel.

AT CLIPPER GAP.—The Ellen Dip Consolidated mine is in Codfish canyon, Colfax district. The lead shows up for 200 feet. The ledge where it crops out on top is 20 inches to 2½ feet wide and at No. 2 is about 18 feet wide; $6 or $7 rock. The facilities for working this mine are excellent. This mine is about 1¼ miles from Black Oak mine which sold for a large sum some time ago. The company has 80 acres; four claims consolidated. The owners are S. F. Woodworth, of Clipper Gap; R. S. Young, of Seattle; D. A. Murdock, of Auburn.

### Riverside.

Sinking in the main shaft of the Santa Rosa mine has been discontinued for the present. The shaft is now down 475 feet and at the bottom the ledge is five feet wide.

J. M. Day has had laid off the men at the Golden Chariot till he could erect more extensive hoisting works, that now in use being inadequate to handle the material from the bottom of the shaft, which is over 300 feet deep. The new hoist will be put in place at once, and the old one will be used in sinking on the new double-compartment shaft of the Santa Fe mine, which is now down 100 feet.

### San Bernardino.

VANDERBILT.—The Brick Mining and Milling Co. has closed down the St. George and is moving everything over to the Boomerang, where it is preparing to do some deep mining. The mill will be started as soon as the new machinery arrives. The Vanderbilt Mining and Milling Co. has suspended operations. Patton & Powell, in doing some development work on the Queen of Night mine, opened a rich vein of free quartz and free gold, which has made every one in the camp feel jubilant. In the Virginia Dale mining district miners are reported coming in by the hundreds. The Virginia Dale is now reported to be richer than ever. The ledge is worked deeper and the mill is to be moved up to the mine and five more stamps added. It has been located down at the water supply, five miles from the mine, but the water will be pumped to the mine, the mill placed by the shaft and doubled in capacity. The rock is porphyry. The district is located about thirty miles east of the McHaney's Desert Queen.

### San Diego.

THE GOLDEN CROSS.—The Golden Cross Mining and Milling Co. at Hedges is in the hands of a receiver. The company's indebtedness is $125,822. A deed of trust has been made conveying the property to trustees authorized to operate the property and apply the proceeds to the payment of debts. The company has transferred to the trustees the Golden Cross, Golden Crown, Golden Queen, General Miles, Sutton, Black Hawk and Union mines and has fifteen months to pay up its indebtedness and redeem its property. If at the expiration of that time the same is not paid in full the property will be sold at public auction. The trustees have taken possession of the mine. Mr. Dolan has been appointed superintendent. The Golden Cross has the largest number of stamps—140—under one roof in California, has an excellent property, and will doubtless be able to liquidate all claims.

### Shasta.

NEARLY FINISHED.—*Free Press*: The grading work on the Iron Mountain railway is about finished. On Friday 100 mules and 150 men came down from the McLean brothers' camp, having been taken off, as the work is nearing completion.

THE OLD SPANISH MINE.—*Democrat*: Considerable development work is just now being done at the old Spanish mine, on the Shasta road, at the old Wiser place. The property is owned by Messrs. Fred H. Deakin and Capt. Taylor. Grading for the hoisting works is now being done. The sinking of the big shaft will be let by contract. The Spanish is a promising piece of property and the owners will put up extensive works on the mine. J. C. Frick is superintendent.

Fowler, Rhodes and Benton came down from Harrison gulch, Shasta county, says the *Sentinel*, bringing with them a gold brick worth $2400, the result of twenty days' run with a little roller mill on ore taken from the Lucky Baldwin and Gold Hill mines. This is a splendid showing and certainly justifies the opinions of those who predicted that Harrison gulch would be one of the liveliest mining camps in northern California. The gold brick was taken to the Bank of Tehama County for shipment to the U. S. mint at San Francisco.

### Siskiyou.

At Happy Camp the Siskiyou Mining Co. has turned the water into a new ten-mile ditch, intersecting Clear creek, from which the water supply is secured; the Chinese Oak Bar mine runs two giants, and the Wingate Hill mine is being prepared for operation next month.

MINING NOTES.—*Journal*: The cold weather lately has frozen up the water supply in several ditches and streams, to prevent washing, and the ground is also hard, to prevent digging in the placer claims. The drift and quartz mines are worked, however, in getting out pay gravel and quartz, preparatory for washing and crushing when the weather moderates.

All the quartz mine owners throughout the county are making greater preparations than usual for extensive operations during the coming spring and summer, and we anticipate a greatly increased gold product in Siskiyou this year, to exceed that of any county in the State.

Hunter & Co. have completed arrangements for opening out the old Punch creek quartz ledge on Humbug creek, which is considered one of the most promising ledges in Siskiyou. It is below the water line, and with a good tunnel extended into it, will no doubt yield handsomely. It shows signs of being a strong, permanent and extensive ledge, and with proper development may prove a bonanza of great richness.

The Espy, Hunter & Co. mine at Hawkinsville is now being worked steadily, with prospects of excellent success. The broken pump has been fixed up by the engineer, Rousiow, so that it is now stouter than before the breakage. The hydraulic work at the claim is under the supervision of Mr. N. Lange of Barkhouse, one of the best hydraulic miners in Siskiyou.

The Horse Creek Mining Co., interested in placer mining ground near Oak Bar, Klamath river, in consequence of not being able to secure water from McKinney creek, owing to the prior right of Wm. Jackson, is now planning to put in a large pump for raising water from the river upon the same principle as the pumping plant at Shasta river near Yreka.

### Trinity.

The *Journal* learns that the Poker Bar Company has a lease from Wm. Weaver on his quartz mine in the Lowden Ranch mining district and will open up the property. A force of men has been put to work.

The Altoona mine at Cinnabar is turning out from 25 to 30 flasks of quicksilver per day. It is one of the richest mines in the world.

At the Integral mine the company has nine men employed in running tunnels. The Altoona and Integral are in close proximity to each other.

## NEVADA.

AROUND MONTGOMERY.—At the Confidence, in Death Valley, the mine is developed with three shafts and a tunnel, all in ore that runs from $30 to $100 per ton. The deepest shaft is 125 feet deep, with a continuous streak of ore from six to fourteen feet wide. The Confidence Company is putting in a twenty-five-ton mill, which will be ready to run about Feb. 1st.

At the Johnnie mine the mill is crushing about thirty tons a day. The new gasoline hoist at the Johnnie is said to be the finest hoist ever on the desert. The Chispa mine, owned by the same company, is temporarily closed on account of the teams being unable to supply both mills with gasoline.

### STOREY COUNTY.

ON THE COMSTOCK.—The Con. Cal. & Va. Company is still finding a considerable amount of good ore on the 1650 and 1750 levels, where it has streaks of ore three to four feet in width assaying $30 to $50 a ton. The average of 303 tons of ore shipped to the Morgan mill the past week was $41.87.

At the Ophir old works they have found some ore—a streak a foot wide—that assays $22.30 a ton. In exploring they find a great deal of rock that assays $2 to $4 a ton. They recently sent the concentrates from 372 tons of ore to the Selby Works to be smelted. Other leading producing mines are yielding about the usual quantity and quality of ore, which is being sent to the mills as extracted.

Material yielding low assays is being encountered in the inclines that are being sunk on the Brunswick lode. Thus far the work is outside of the vein and no crosscutting has been done.

THE BRUNSWICK LODE.—Herman Zadig, during his recent visit to the Comstock, told an *Enterprise* reporter that a number of prominent capitalists, among whom is Colonel Alvinza Hayward, were about to take an active interest in the operations of the Brunswick Exploration Company. We have learned since Mr. Zadig departed that his plan to run a drift from the Comstock out to the Brunswick lode is now almost a certainty, enough support having already been given to the project to assure its success, and Engineer Gooth Haist has been engaged to make maps and to report on the most favorable terminus of the drift. It is believed by the promotors of this plan that valuable bodies of ore will be encountered between the west wall of the Brunswick lode and the east wall of the Comstock.

Regarding the proposed connection to be made between the Sutro tunnel and shaft No. 1 on the Brunswick lode, these capitalists are willing to undertake the substantial backing of the stocks of the various Comstock mining companies for half the expense, but will expect the Comstock Tunnel Company as an equal beneficiary to assume the other half of the cost, which in reality will be but slight.

Frank Leonard, president of the Comstock Tunnel Company, was seen last Tuesday by an *Enterprise* reporter. He said: "I am in favor of accepting the proposition and shall do all in my power to get the people of my company in New York to see it through, but first it is necessary to establish confidence in the East."

Eastern capitalists are slow and conservative and it takes some time to arouse their enthusiasm. It is certain that in case a strike should be made in the Brunswick, as it is generally believed will be, the Comstock tunnel, having no connection with the Brunswick lode workings, the tunnel company would lose all benefit from the strike.

### ESMERALDA COUNTY.

At Aurora some ground, on which tailings have been accumulating since the early days of that once flourishing camp, has been located under the mining law. The ground is now covered with a dense growth of sagebrush.

The Hawthorne *Bulletin* says the report of the sale of the Silver Star group of mines is merely rumor, as the owners of the claims fail to verify the report.

### LYON COUNTY.

The Dayton *Times* says Peck Bros. will put up a concentrating plant at Dayton next spring that will give employment to thirty or forty men.

### LINCOLN COUNTY.

Fifty-six tons of gold ore from the April Fool, that netted the owners about $15,000, was sold in Salt Lake City last week. The *Tribune* says the ore was in two lots, both high grade, but one containing thirty-six tons, selling at $320 a ton; the other containing twenty tons and bringing $135 a ton. The grade is not up to that which was made by a previous shipment, for which $13,000 was received for less than twenty tons; but with $15,000 to their credit the owners will experience no difficulty in reconciling themselves to the disappointment.

The story of the April Fool promises to be the story of its sensational neighbor, the De Lamar, the present production of which has been variously estimated at from $60,000 to $100,000 per month, the company pleading, as an excuse for withholding the real facts, that the road agent might be irresistibly tempted. To date the April Fool has produced and marketed in this city about 400 tons of this high-grade material, and now that it has the ores blocked out sufficiently to justify it, the erection of a mill will take place at an early day.

Those who have seen the dump say the ores are identical with those that are being so successfully milled at the De Lamar. It is claimed that the contents of the entire vein will average between $85 and $100 per ton; and before returning to the property, Manager Wilson will very likely place the order for a mill. At present the haul from the mine to the railway is a long one and an expensive one, and the owners are precluded, as were those of the De Lamar, in its patriarchal day, from marketing anything but that which is worth its weight. Around the De Lamar mine has grown up a camp with a population of 1200, lighted by electricity, and with waterworks and other modern conveniences; and with the April Fool employing as many in its mine and mill, the strides of the camp in 1896 should place it among the foremost at the close of the year.

Concerning the April Fool, the De Lamar *Lode* says that for the past year the property has been under lease to Frank Wilson, the principal owner, and W. J. Dooley, who have operated it with good results. The group consists of six mines, and an application for patent is now pending on the group. During the past year water has been acquired by the April Fool Company, and is now being piped to the mine, a distance of nine miles, and it is stated on very reliable authority that before spring sets in this company will have a combined ten-stamp, with capacity for twenty stamps, cyanide mill, in full operation. There is certainly something to justify this, otherwise it would not be done.

### OREGON.

#### BAKER COUNTY.

DOING CUSTOM WORK.—The Riverdale quartz mill, Powder river, owned by the Keystone Mining Company, J. T. Bolles superintendent, is crushing one hundred tons of free milling ore from the Buckeye mine, situated four miles east of North Powder.

John Vass is superintendent of the Bellevue mine, Granite district. During '95 development work done on the property to the amount of 256o feet, 4500 feet on the vein is exposed.

### BRITISH COLUMBIA.

TRAIL CREEK.—A new air compressor is installed on the Center Star, capable of running several new drills. This claim adjoins the Le Roi. There is now a tunnel of 500 feet driven on the ledge and 100 feet from the face is an uprise of 172 feet. The plan of development is to continue the tunnel 800 feet to the line of the Le Roi, and crosscut 250 feet to the south and 350 feet to the north. There are four parallel veins on the claim. It is estimated that development will be completed by August.

F. E. Ward, acting for Aug. Heinze, who controls the Trail Creek smelter, has published a notice of an application for a charter to construct a railway from Trail Landing to Rossland, thence through by way of Midway to Penticton or some point on Okanagon lake. The first part, that to Rossland, is under construction and will soon be completed. There is said to be no suitable pass from Trail creek to Boundary creek, but if the road goes through it is with the evident intention of bringing Boundary creek ores to the Trail smelter.

The Rossland *Miner* devotes some space to differences between D. C. Corbin, of the Nelson & Fort Sheppard railway, and the mine owners. When applications were made for crown grants of certain mineral claims, Mr. Corbin filed adverses. The Paris Belle was one of these, and J. W. Winthrop, of Spokane, came to Rossland and it is presumed circulated inflammatory cards calling a mass meeting. He did not appear at the meeting, but a committee was appointed to interview Mr. Corbin as to what his contentions were. A committee was also appointed to confer with the Provincial government and take such steps as are necessary to protect the miners' interests. The day after the meeting Mr. Corbin telegraphed the Rossland *Miner* that his company did not intend to put obstacles in the way of mining development, but would grant them surface rights necessary to work them, wood for building and fuel, but not for commercial purposes. The land was granted to the Nelson & Fort Sheppard.

AINSWORTH.—An Ainsworth correspondent of the *New Denver Ledge* relates how the Lady of the Lake mineral claim has been made to pay. The property is situated one and a half miles southwest of Ainsworth, and alongside Loom lake, a body of water half a mile long and 300 feet wide. The water retarded them, so they decided to siphon the lake, which they did with a three-inch pipe. This ran several months, and then the winter of 1894-5 froze it up. In January the siphon started running again, and now the lake has been lowered twenty feet and by spring it will be dry. Clark & Van Hook, the proprietors, sunk on the vein as the water went down, and from the surface shipped two tons which went $76.50 to the ton. About $3000 worth of work has been done.

CARIBOO.—The Ashcroft *Journal* gives an interview with John K. Barber, who was foreman of the men constructing the flume for the Cariboo mine at Quesnelle Forks, in which Mr. Barber says the walls of the pit are 300 feet high, and will be higher next year, as the large nine-inch nozzles eat into the bank. A change will probably be made to some extent in the mode of operation. A tunnel will be run for flume and sluice box into the gravel back from the direction of the river. This tunnel is to get through some indifferent gravel, which will not be worked for a year or two.

Mining of gold-bearing gravel deposits by hydraulic, drifting, sinking and sluicing are old methods in Cariboo, but mining by dredging has resulted unsuccessfully in the few attempts that have been made. Dredges have been and are being built on the upper and lower Fraser river, which, it is claimed, will be able to suck from the bottoms of streams the millions of gold known to exist there. The beds of the Quesnelle and Fraser rivers and branches for many hundreds of miles have been leased for this purpose.

A company is also being promoted in England for the purpose of erecting a dam to change the waters of one fork of the Quesnelle to the other, for the purpose of taking the gold from the river bed, where, a prominent mining man recently said, there is gold enough to pay off the national debt.

A local company is now endeavoring to turn the north fork of the Quesnelle by a cut through an abrupt bend in the river, with the object of cleaning up about 3000 feet of river bed, which is known to be very rich.

Quartz mining is also being resumed in Cariboo. The whole district is lined with reefs and ledges, many of known value.

### ALASKA.

The coming season will doubtless see renewed activity in mining operations.

It is stated that a steamer is being fitted out at Seattle to take 300 miners to Quarnagain arm this spring, and that a Fresno man named Dusoy has chartered a steamer to take a party of 100 or more from San Francisco. It is estimated that 600 or 700 miners will leave the coast for Cook's inlet this year.

### IDAHO.

MINERAL PRODUCTION FOR '95.—Wells, Fargo & Co.'s report of the mineral production of the State for the year 1895, prepared by Alfred Eoff, cashier of the Boise City National Bank, is as follows:

| COUNTIES. | Gold. | Silver, Ounces | Silver, 97 cents per ounce. | Lead, Tons | Lead at $40 per ton | Total. |
|---|---|---|---|---|---|---|
| Ada | $ 27,000 | 6,300 | 4,120 | | | $ 31,120 |
| Bingham | 52,000 | | | | | 52,000 |
| Blaine | 52,000 | 4,000 | 2,600 | | | 54,600 |
| Boise | 26,000 | 415,000 | 271,810 | 2,000 | $ 80,000 | 377,810 |
| Canyon | 26,000 | 70,000 | 45,850 | | | 71,850 |
| Cassia | 26,000 | | | | | 26,000 |
| Custer | 52,000 | 4,000 | 2,620 | | | 54,620 |
| Elmore | 52,000 | 158,000 | 103,480 | 1,000 | 40,000 | 195,480 |
| Fremont | 52,000 | 2,000 | 1,310 | | | 53,310 |
| Idaho | 52,000 | 96,000 | 62,880 | 2,000 | 80,000 | 194,880 |
| Kootenai | 52,000 | 2,000 | 1,310 | | | 53,310 |
| Lemhi | 52,000 | 2,000 | 1,310 | | | 53,310 |
| Logan | 52,000 | 2,000 | 1,310 | | | 53,310 |
| Nez Perce | 52,000 | 2,000 | 1,310 | | | 53,310 |
| Oneida | 52,000 | 2,000 | 1,310 | | | 53,310 |
| Owyhee | 52,000 | 96,000 | 62,880 | 2,000 | 80,000 | 194,880 |
| Shoshone | 52,000 | 2,000 | 1,310 | | | 53,310 |
| Totals | $ 821,000 | 1,000,300 | $ 655,190 | 7,000 | $ 280,000 | $ 1,756,190 |

SUMMARY.

| | 1895. | 1894. | 1893. |
|---|---|---|---|
| Gold | $2,521,000 | $1,870,000 | $1,645,000 |
| Silver | 2,807, 50 | 2,359,000 | 1,848,946 |
| Lead | 2,028,960 | 2,605,400 | 1,524,000 |
| Totals | $7,355,310 | $6,843,400 | $5,017,946 |

This shows a total increase over last year of $511,910. The increase of Ada county was $69,120; for Boise county the increase was $44,000; for Elmore county the increase was $4500; for Owyhee county the increase was $595,850.

THE LUCKY BOY MINE.—At the Lucky Boy in Custer, the mine and mill have eighty men at work. The altitude of the Lucky Boy mine is estimated at 9,000 feet above sea level on Custer mountain, and the mill is about 2,000 feet lower, the two being connected by a Hallidie suspended wire tramway. About $40,000 has been expended in purchasing and delivering supplies to the mine and mill to insure the working of the property at full blast during the present winter, but as an offset to this the mill is turning out about $4,000 in gold and silver bullion each day. As yet the winter weather has not interfered with the shipment of bullion, which has been regular since the mill started on October 1st last, the bullion which carries an average value of $8 per ounce being shipped to Omaha. The Lucky Boy is a close corporation being owned by four Salt Lake men. Major W. Stanton, formerly chief of the Salt Lake fire department is superintendent of the mine; Charles M. Dunloy, chief engineer; Theodore Wust is metallurgist and superintendent of the mill. Henry Knapp is the assayer and melter for the company.

(Special correspondence).—Your article in reference to assessment work is concise and to the point. There is a general opinion among most miners that twenty days' work constitutes an assessment, but I am inclined to believe that your opinion is right in reference to the time being governed by the current rate of wages. A notable instance of which I was an eye-witness occurred here on Jan. 1st. The Best Chance and Golden, two claims originally owned by D. Doles and sold by him to Clem. King, Capt. Thomson and others for $30,000, and on which the first payment of $2400 was made, were relocated by J. B. Williams of Spokane and Capt. Baughman of Lewiston. The locators claim that the property was open, for the reason that there was insufficient work done on it for the year ending Dec. 31, 1895. It will doubtless occasion an expensive lawsuit. The Golden Ribbon quartz lode, owned by M. A. Ellis and others, is bonded to J. B. Williams, consideration unknown. The ore in this ledge is small, but it runs about $125 a ton, free milling. J. B. Williams has also secured an option for Spokane parties on the Caledonia lode. The Caledonia is a large ledge of low-grade ore, the ledge in some places being thirty feet wide, average value about $4 per ton. It is a contact between porphyry and silica schists. The property is free-milling; it has had hardly any work beyond assessment work done on it, similar in that respect to many other ledges in this camp, the repeal of assessment work for '93 and '94 having retarded all, or mostly all, development in the camp.

Dunn Bros & Co. have incorporated their property under the name of the Crescent Gold Mining Co.

The Idaho mine is showing up well, the tunnel on the second level being now in seventy-five feet. The tunnel on the first level is showing up about two feet of ore in the face, about 50% of the ore being free, the balance being slightly rebellious. The Idaho mill has been closed down for about two weeks on account of water freezing up; but it will start up again on the 7th inst. There is at present about 100 tons of ore awaiting treatment in the ore bins of the Idaho.

Pierce City, Shoshone Co.

The Yellow Jacket Mining Company, has completed its new tramway; the output in 1896 promises to show a large increase with its forty additional stamps at the mill.

A Huntington mill will be in operation on the Uncle Sam and Idaho claims at Black Bird Camp, by May 1st. A half interest in them was purchased last fall by J. Y. Swift for $12,000. It is claimed that on the property are seven feet of ore, the average value of which is $30 a ton.

### UTAH.

NEW MINING COMPANY.—*Tribune:* The Mercur King Mining Company has incorporated at Salt Lake; capital stock $1,000,000, divided into 200,000 shares of the par value of $5 each, 150,000 of which are taken; officers, G. W. Thatcher, president; G. E. Blair, secretary and treasurer; these, with E. A. Wall and E. L. Sloan, constitute the board of directors. The company owns the Mercur King group of claims in the Camp Floyd district, the group comprising the Golden Fleece, Golden Circle, South Bend and Gable End.

### MONTANA.

A new company, the Washington Valley Mining Company, has acquired 42 claims in the Timbered Buttes, near the city of Butte, and expect that development will bring to light a big copper ledge. J. H. Morong is secretary and manager. The development work includes a shaft of 800 feet on the Free Coinage and a 400-foot shaft on the Alice May—two of the most promising of the claims.

The shaft on the Free Coinage will be double-compartment. A shaft house is now being erected. All the claims upon which development work has been done assay high in gold and silver with a good percentage of copper and all the indications lead to the belief that the ledges will eventually turn into copper. In some of them assays as high as $280 in gold have been obtained. The other claims which have been partially developed are the Little Hattie, with a shaft of 80 feet, the Mitsch, which is down 40 feet, the Brooklyn Boy, with a shaft of 60 feet and a tunnel 107 feet, and the Gold Courier with a shaft 40 feet. Many of the others are developed to a depth of 10 to 25 feet.

The properties are located about one and a half miles west of the Timbered Butte and in the early days this locality furnished a large amount of gold from the placers. The new owners are of the opinion that there is a good deal of placer gold yet in that locality and will put in a dam to work the Meadow Lark placer in Grove gulch next spring.

The Elk Horn Mining Company of Montana has purchased claims on East Fryer hill at Leadville, and is moving its hoisting plant, pumps, etc., to that camp.

### SOUTH DAKOTA.

A BREAK-DOWN.—Deadwood *Pioneer:* The Highland Chief mine has closed down until a better foundation can be placed under the ball pulverizer. Between thirty and fifty tons were pulverized with perfect success, and it was proven that the pulverizer could handle more ore in a day than a twenty-stamp mill, but Saturday night, owing to a displacement of the machine, the balls got to pinching and three of them were broken to fragments. These balls are of tempered steel, 9 inches in diameter, and weigh 105 pounds; before leaving the factory they were subjected to an 800 pound blow to test their flexibility. That they should be rent in pieces seems remarkable, but they are run by powerful machinery at the rate of 1200 revolutions per minute, and when there is any impediment to their progress something has to give way.

THE MOFFITT PROCESS.—*Pioneer:* The Moffitt oxidizer which has been put in at Pluma has proven a success. Test runs have been made upon all kinds of Black Hills ore obtainable, a half ton of each class being operated upon. One run was made upon ore from the Golden Summit mine, above Lead City, the ore being of a low grade, averaging $5 to the ton, and from 92 to 95 per cent of the gold was saved, according to assays made of the tailings. A run was then made upon half a ton of concentrates from the Homestake, carrying $9 to the ton, and the same percentage of the gold was saved as in the Golden Summit rock. The Kildonan chlorination plant roasts the ore in the White-Howell roaster, requiring twelve hours to put it in shape for treatment by that method. The Moffitt plant yesterday put this ore through at the rate of a ton an hour, the oxidizing cylinder disposing of it as fast as it could be conveyed from the crusher. The pulverizer and plates are not in running order at the plant, owing to some defects, and the ore, after going through the oxidizer, is sent to Lead City, where it is treated by the ordinary amalgamation method. The plant at Pluma has a capacity of twenty-four tons per day (two shifts) and by a careful estimate it is found that the expense of treating this amount of ore does not exceed $30, or at the rate of $1 25 per ton. The ore is crushed to a twenty-mesh fineness before it is carried to oxidizer, which is a sheet iron cylinder 12 feet long, the inside being fitted with little troughs running lengthwise of the cylinder. At every inch along the bottom of a trough is a blow pipe, one thirty second of an inch in diameter, and as the cylinder revolves very slowly, the troughs carrying the ore, hot air at a very high pressure, plays upon the ore, subjecting it to a violent action, the oxygen freeing the gold as thoroughly as can possibly be desired. Precipitating tanks have not yet been put in, the crushed ore being handled in dry state, and the dust is almost suffocating. In treating concentrates the fumes of sulphur are very disagreeable, but it is said that by driving the powdered substance into tanks this feature may be removed.

The Keystone *Nugget* reports that the Holy Terror Mining Company has resumed sinking the main shaft, which will be carried down another 100 feet. A carload of machinery, consisting of a complete battery—five stamp-shanks, shoes and dies—and a new improved steel cage for the hoist, has arrived.

There have been formed in the Black Hills country within the past few months twenty gold-mining companies with a total capital stock of $20,000,000. Most of these companies have been formed since the late remarkable finds in all parts of the Hills, which have been developed far enough to show their real value and the permanency of the mines.

### MICHIGAN.

CALUMET & HECLA CO.—The production of this company from data for '95 amounts to about 75,000,000 pounds of refined copper. The mine is reported opened ahead for seven or eight years, and some think that their present openings are sufficient to supply a product of over 70,000,000 pounds of copper per year for over ten years. They are opening crosscuts from the conglomerate to the amygdaloid or Osceola lode, which is about 800 feet to the east of the conglomerate. This lode has been exposed at several points and is showing copper in paying quantities where it has been pierced, with but one exception.

THE TAMARACK MINING CO.—At North Tamarack valuable ground is being opened south of No. 3 shaft. The new hoisting shaft is one of the best at Lake Superior, which enables the company to handle its rock very economically. The lode at No. 4 shaft is expected to soon reach the rich run of productive ground that is in the Tamarack, Jr. The lode is understood to be as rich at a depth of over 7000 feet on the line of the lode as at the surface. The company owns 1160 acres of mineral land under which the Calumet conglomerate and the Osceola amygdaloid lodes dip at an angle of 38°, which is ample territory to supply, it is said, the present output for 100 years.

### COLORADO.

A BROMIDE PROCESS.—A press dispatch from Boulder, Colorado, declares that "an invention of importance for the treatment of the low-grade ore of Cripple Creek, Boulder county, and other telluride camps, has just been successfully demonstrated on a large scale by its inventors. A fifty-ton mill has been erected at Boulder by a few New York capitalists to test the process, and an extremely high extraction has been obtained from $8 ores. The mill is now in operation day and night, and the process will open up immense fields of low-grade tellurides hitherto considered untreatable. The inventors use bromide, but recover it continuously at extremely low figures.

At Sawpit gulch, in southwestern Colorado, A. S. Blake, the first discoverer of gold there, is reported to have sold through George Crawford of New York the Commercial group of mines for $250,000 and the Belle Champion for $50,000.

### NEW MEXICO.

The Maud S. at Mogollon, is running full. The company has recently purchased the Grey Hawk mine from Trailer & Deany.

The Confidence Company at Whitewater, is running seventy-five men and has added a new hoist.

Bland is reported "booming." The Iron King is working a full force two shifts and taking out about sixty tons per day. The J. D. Snider Mill Company is working on Iron King ore; the ore runs nearly $80 per ton. The Star mine is working a full force and is shipping ore to Pueblo. Another stage line has been put on.

### ARIZONA.

MINE SOLD.—A press dispatch says the Last Resort mine, in the Mohawk mountains, thirty miles northeast of Yuma and twenty-two miles from the Gila river, has been sold to Col. T. C. Lane of Salt Lake for $150,000 cash. It was discovered by Hulbert, Albert and Thomas. "Hulbert and Thomas were barefooted when Col. Lane struck the camp in July last, and inside of an hour he had bonded the property and paid each man $1000 as evidence of good faith. The shaft was sunk 150 feet, with crosscuts at fifty feet. The ore at the first cut assayed $110, at the second $115, and at the bottom, where the ledge is twelve feet wide, it ran $150 per ton in free gold. A twenty-stamp mill will be put up at once and water is to be pumped something like twenty miles. During the development under Lane's bond water for all purposes was transported on burros from the Gila river. The first prospect was made in a little blowout that was covered by malpice rock or lava."

### MEXICO.

#### SONORA.

*Oasis:* The Santo Domingo mines of M. G. Levy, of Nogales, are assuming importance. In 1895 Mr. Levy did 2000 feet of development work and has now exposed a body of ore ranging in value from $18 to $20 per ton, which an expert recently estimated could

readily stope out from 30 to 50 tons per day. Development will be continued through 1896 on a much larger scale. At present the ore is reduced by the arrastra process, assorted ore running $30 per ton being treated. The contemplated improvements include a thirty-stamp mill and roasters on the Santo Domingo river, eight leagues away, and a narrow-gauge railway connecting the mines with these reduction works.

### NEW JERSEY.

EDISON'S SUCCESS.—A press dispatch this week says that Thomas A. Edison has at last brought to a practical conclusion his ore separating process at his mine at Edison, near Ogden, N. J., on which he has been at work for many years; that the process is a success and the plant in running order. The cars of ore are dumped in large masses into crushers, the process being entirely automatic. The crushed rock and ore are carried from one set of crushers to another by endless belts and bucket elevators, till the material is reduced to the requisite fineness, and then another series of belts and elevators carry it to the separating house, where the material falls in a fine stream across a field of large electro-magnets, which divert the iron from the direct line of fall and drop it in one receptacle, while the refuse and rock fall into another. This process is repeated a number of times, till at last the resultant product is pure magnetic oxide of iron. "Automatic carriers take the iron ore thence to the bricking plant, where, by mechanism on which the inventor has spent thousands of dollars, the ore is mixed with a binding material and pressed into bricks for convenience of handling. These are then baked and are ready for the market. The sole remaining work of construction yet to be done is the building of rotary furnaces, which shall bake the bricks as they are delivered and turn them out automatically. There are no mechanical or scientific difficulties connected with this part of the process, and these furnaces are to be built as soon as the frost is out of the ground in the spring."

### AUSTRALIA.

Australian mining in its various forms continues to prosper. The production of gold in almost every colony is increasing, and in Victoria, Queensland and Tasmania, owing to improved processes, the net profits upon the operations are larger than formerly. The Western Australian yield does not yet answer to expectations, averaging at present between 20,000 and 25,000 ounces per month. That there is plenty of gold in Western Australia has been placed beyond all doubt: but the country is almost a rainless desert, and the water difficulty makes mining very expensive, as well as retards settlement. Some millions sterling of British and French money have been invested in Western Australian mining enterprises, but no return has as yet been made, and none appears to be probable for a long time to to come. There are only three Western Australian mines in the dividend-paying list. One of these (Bayley's Reward) distributed 4d. per £ share (480,000 shares in all) on December 31, 1894; the second (Great Boulder, paid a dividend of 2s. per £ share (175,000 shares) on October 5th last, and the third (Lake View) paid 6d. per 10s. share (80,000 shares) on 1st instant. Results to shareholders have thus been exceedingly meager, but the colony, with its 70,000 inhabitants, is enjoying the luxury of a boom at the expense of the foreigner.

Silver and lead mining in the Broken Hill district has received great encouragement from the success now attending efforts to treat the enormous quantities of sulphide ores available. Two large companies have been formed for the purpose, and one of these companies (having the right to the Ashworth patents) is largely American, London capitalists (including the Rothschilds) co-operating with New York shareholders. The market in Broken Hill mines has advanced all along the line, although several of them have not yet commenced to pay dividends. The successful treatment of the sulphide ores is likely to add very considerably to the world's annual supplies of lead and zinc. The net addition to the supplies of silver will be insignificant, for in the first place, the sulphides are not rich in silver, and, in the second place, carbonate ores, which are extremely productive, are being exhausted. From an American point of view, the subject is interesting principally in connection with the future of the lead market.

The Mount Lyell mine in Tasmania is distinctly different from the Broken Hill mines in New South Wales. In the latter case the silver is found with lead, in the former with copper, the vein being described as one of argentiferous copper pyrites, which occasionally yields a little gold. Mount Lyell has recently been visited by two experts, viz., Mr. T. A. Allan, late general manager of the Tharzis mine in Spain, who estimates the quantity of ore in situ at 5,287,702 tons, of which he states that 3,539,687 tons are rich, and Dr. E. D. Peters, Jr., who estimates the profitable ore at 4,600,000 tons, with the following average contents per ton, viz., gold, 2¾ dwts.; silver, 3 ounces; copper, 100 pounds. A specially rich patch gave 851,192 ounces of fine silver and 184 tons of copper out of 930 tons of ore. The company owning the mine is at present establishing its plans, setting up machinery, and constructing a short railway to the coast, going to a great expense. When it has perfected its arrangements it will commence paying dividends, say in about twelve months. The par value (largely written up) of its share capital is £900,000, and today's market value is about £1,200,000.

Great as has been the reward to mining enterprise in Australia in the past, experts believe that there are greater things ahead, and that Australia will yet assume a much higher position in the world as a producer of gold, silver, lead and copper. When it is remembered that the principal Broken Hill mine (silver and lead) has paid nearly £6,000,000 in dividends, and that the Mount Morgan gold mine has paid about £4,000,000, it is not surprising that the public impressed by the possibilities of mining in Australia.

THE CYANIDE PROCESS

of Gold Extraction, and its Practical Application on the Witwatersrand Gold Field in South Africa. By M. Eissler. With Diagrams and Working Drawings. 8vo., cloth.....$3.00

"*This book is just what was needed to acquaint mining men with the actual working of a process which is not only the most popular, but is, as a general rule, the most successful for the extraction of gold from tailings.*"

By the same author:

THE METALLURGY OF GOLD.

A Practical Treatise on the Metallurgical Treatment of Gold-Bearing Ores, including the Process of Concentration and Chlorination, and the Assaying, Melting and Refining of Gold. Fourth edition, enlarged to 678 pages, with about 250 illustrations and numerous folding plates. 8vo., cloth.....$5.00

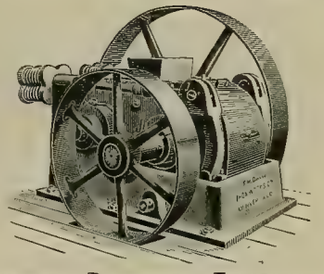
"*This book thoroughly deserves its title of a 'Practical Treatise.' The whole process of gold milling, from the breaking of the quartz to the assay of the bullion, is described in clear and orderly narrative and with much, but not too much, fullness of detail.*"

THE METALLURGY OF SILVER.

A Practical Treatise on the Amalgamation, Roasting, and Lixiviation of Silver Ores, including the Assaying, Melting and Refining of Silver Bullion. Second edition, enlarged. 12 mo., cloth.....$4.25

"*A practical treatise, and a technical work which we are convinced will supply a long-felt want. For chemists, practical miners, assayers and investors alike, we do not know of any work on the subject so handy and yet so comprehensive.*"

THE METALLURGY OF ARGENTIFEROUS LEAD.



A Practical Treatise on the Smelting of Silver-Lead Ores and the Refining of Lead Bullion; including Reports on various Smelting Establishments and descriptions of Modern Smelting Furnaces and Plants in Europe and America. 183 illustrations. Cloth.....$5.00

"*The numerous metallurgical processes, which are fully and extensively treated of, embrace all the stages experienced in the passage of the lead from the various natural states to its issue from the refinery as an article of commerce. The present volume fully maintains the reputation of the author.*"

*Sent by mail on receipt of the price.*

JOHN W. GRAY, Mining & Hydraulic Engineer.
Explorations. Examinations, Reports, Surveys, Maps, Development and Working of Mines. Correspondence invited from those wishing to make investments in mines or secure and develop promising claims.
Res.—923 Linden St., Oakland, Cal.

W. J. ADAMS, E. M.,
PRACTICAL MINING ENGINEER.
Graduate of Columbia School of Mines. Expert on general mill work and amalgamation. Fifteen years' experience. Specialties: The saving of fine gold; vanner concentration and chlorination. Address, Golden King M. Co., Alleghany City, Sierra Co., Cal.

Mark B. Kerr,
MINING ENGINEER
—AND—
Deputy U. S. Mineral Surveyor.
(Formerly Topographer U. S. G. S.)
Valley Springs,.....Calaveras Co., Cal.
Surveys executed and U. S. Patents obtained for Mining Claims, Mill Sites, etc.
S. F. address care Judson & Shepard, 402 Front.

LOUIS FALKENAU,
STATE ASSAY OFFICE,
434 California St., near Montgomery.
Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.
Court Experting in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

The Evans Assay Office.
W. N. JEHU, - - - Proprietor.
Successor to Jehu & Ogden.
628 Montgomery Street, San Francisco.
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

School of Practical, Civil, Mechanical,
Electrical and Mining Engineering.
Surveying. Architecture, Drawing and Assaying.
723 Market St., San Francisco, Cal.
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
Send for Circular.

F. H. HARVEY. W. S. HUTCHINSON.
HARVEY & HUTCHINSON,
GALT, CAL.,
Mining and Metallurgical Work in All Branches.
Assays, Chemical Analysis of Ores and experiments on rebellious ores for treatment by cyanide or other processes. Surveys and reports upon mining properties.

W. B. TAYLOR. H. C. WARD.
Nevada Metallurgical Works,
Established 1869.
Ores Crushed and Sampled and Working Tests Made by any Process.
Assaying in all its branches.
Analyses of Ores, Minerals, Water, Etc.
C. A. Luckhardt & Co.
Formerly Riotte & Luckhardt and Huhn & Luckhardt.
Mining Engineers and Metallurgists.
No. 23 Stevenson Street,
Near First and Market Sts., San Francisco.

Everette's Mining Office.
(Pioneer Mining Geologist's Office of the Pacific Northwest.)
MINING LAW, MINE EXAMINATIONS, METALLURGY, ASSAYING AND ANALYSIS.
"Consulting Associate Mining Attorney at Law."
Will examine and report upon "Title and Exact Value" of Gold, Silver, Lead, Copper, Coal, Iron, Clay or other Mineral Properties IN ANY PART OF THE WORLD. Any information mining men may desire to know, relative to the MINERAL or COAL resources of the entire Pacific Northwest, will be honestly given.
Dr. Willis E. Everette,
1141 R. R. Ave.
Tacoma, State of Washington, U. S. A.

HERBERT LANG,
Mining and Smelting Engineer,
Shasta, Shasta Co., California.

WADE & WADE,
Analytical Chemists and Assayers,
109½ Commercial St., Los Angeles, Cal.

ALMARIN B. PAUL, M. E.,
ROOM 49, CROCKER BUILDING.
Cor. Market and Montgomery Sts., San Francisco.
Will act as AGENT for the sale of RELIABLE Mining Property. Principals desiring valuable quartz or gravel investments at reasonable prices will do well to see what I may have. Only legitimate mining properties handled.

EDWARD S. COBB,
MECHANICAL ENGINEER.
GENERAL MACHINERY.
HYDRAULICS, POWER, TESTS, ETC.
109 California Street,
Rooms 30 and 31.....San Francisco, Cal.

ALBERT MALTMAN, Practical Metallurgist and Engineer.
SAMUEL C. THOMPSON, A. B. Yale University. E. M. Columbia University.
Maltman & Thompson,
MINING ENGINEERS AND METALLURGISTS,
Owners of Nevada County Reduction Works,
Address: Grass Valley, Nevada County, California.
Inspect and report upon Mineral Properties, Treat Refractory Gold Ores and Concentrates by Chlorination. Furnish Plans for and Superintend Erection of Chlorination Plants, General Analyses of Ores.

This College instructs in shorthand, typewriting, bookkeeping, telegraphy, penmanship, drawing, all the English branches, and everything pertaining to business, for full six months. We have a large corps of teachers and give individual instruction to all our pupils.

A Department of Electrical Engineering

Has been established under thoroughly qualified instructors. The course is thoroughly practical. Send for Circular. C. S. HALEY, Sec.

## Coast Industrial Notes.

—The Judson Iron Works at Emeryville is experimenting with crude petroleum as a substitute for coal in the blast furnaces.

—The El Completo Coffee and Commercial Co. has incorporated here—capital stock $75,000—to raise and market coffee in Mexico and Central America.

—The Crystal Rock Salt Mining Co. has incorporated here; capital stock, $500,000, of which $227,000 has been subscribed; directors, C. J. Ahlborn, S. Bennett, M. Lewis, J. Reimer, B. Lewis.

—The Bridgeport Travertine Company has received an order from London for 20 columns, each 14 feet long and 2 feet in diameter, with caps and bases, for a Catholic cathedral now in course of erection in that city.

—The Rix Compressed Air Machinery Co. has incorporated in this city; capital stock, $50,000, all of which has been subscribed; directors, E. A. Rix, A. R. B. Rix, W. A. Hewitt, P. H. Reardon, A. Barnard.

—The California wool crop for '95 was 35,856,690 pounds, against 36,968,400 pounds in '94. Spring clip, 24,018,110 pounds; fall clip, 10,080,580 pounds; pulled wool, 1,758,600 pounds. The exports during the year were 26,356,000 pounds, exclusively by rail, and were valued at $3,500,000. The stock on hand Dec. 31, '95, was 6,000,000 pounds, including scoured wool.

—During the week, tests of powder for the 13-inch guns for use on board the battleships of the navy have been in progress at the Indian Head proving-grounds. Among the samples fired are two lots manufactured by the California Powder Works. The result obtained from these samples is reported satisfactory, a maximum velocity of 2080 feet per second having been obtained with a pressure in the neighborhood of fifteen tons.

—Following is a comparative statement of coal imports at San Francisco in 1895 and 1894:

| | *Tons in 1895.* | *Tons in 1894.* |
|---|---|---|
| Australia | 220,800 | 177,200 |
| Great Britain | 203,800 | 174,000 |
| British Columbia | 507,300 | 487,600 |
| Eastern | 21,500 | 19,200 |
| Seattle | 137,900 | 157,700 |
| Tacoma | 272,200 | 257,300 |
| Coos Bay | 44,700 | 41,600 |
| Other Mines | 7,000 | 14,500 |
| Totals | 1,415,200 | 1,329,100 |

—The Butte county Board of Supervisors have contracted with W. W. Montague & Co. to furnish 26,000 feet of steel pipe—19,000 feet eight-inch and 7000 six-inch—for road sprinkling. This pipe is to be made in Chico, where the contractors have fitted up a shop. The first consignment of steel plates, from which the pipes will be made, has arrived from Philadelphia. The work of bending and riveting the plates will take about sixty days, employing ten men. Marysville being a terminal freight shipping point the only excess freight rates are from Marysville to Chico, so by having the plates shipped there the contractors save the rates on the pipe from San Francisco to Marysville.

—Lacy & Rowland, who have been sinking oil wells at Puente, propose to build a refinery at Chino to convert the crude petroleum of Puente into illuminating oil and by-products. This refinery will be of 600 barrels daily capacity. It includes two 250-barrel stills and one 100-barrel still. The machinery will not be grouped in one large building, but will be in a number of buildings. The different stills, tanks, warehouses, shops, office, etc., will cover about four acres of ground. There will be three 45,000-barrel tanks and a number of smaller ones. The product of this refinery will at first be illuminating oil, naphtha and gasoline, though as soon as it is in operation experiments will be made to ascertain what other products can be profitably derived.

—A twelve-mule team left Fresno on the 11th with two wagons and 18,000 pounds of electric plant for the San Joaquin river—the framework and the armature for one of the dynamos which will generate electricity to be transmitted to Fresno. Two of these dynamos have arrived from New York, and another is on the road. Each dynamo weighs 24,000 pounds, but is in three pieces, and each piece can be handled separately. The largest piece weighs 11,000 pounds and is loaded on the front wagon; the next piece, 8000 pounds, is on the trail wagon. The 5000-pound piece will go at another time. The second dynamo remains for the present near the freight depot. The road to the mountains is a fairly good one. The bridge across the San Joaquin, built by the electric company, was designed especially to carry such loads. There is other heavy machinery to go, but not so heavy as these.

—The new oil-tank steamer, George Loomis, is at Ventura. It was built at the Union Iron Works for the Pacific Coast Oil Company, of steel throughout, the material being entirely of American manufacture, part of it having been cast in the East, and the major portion turned out from the Pacific Rolling Mills. The steamer is 196 feet in length; 27.5 feet in breadth of beam; 17 feet depth of hold. There are six tanks amidships, or one immense tank divided into compartments by a bulkhead running fore and aft, and two transverse bulkheads. Each separate tank will hold 1000 barrels of oil, and the vessel can be loaded or discharged in eight hours. Steam is generated by coal oil supplied from the refinery of the Pacific Coast Oil Company, and the steamer will be the means of furnishing oil for fuel to the various points around the bay. The Loomis will probably average five round trips a month, bringing to San Francisco 30,000 barrels of oil in that time. At present there are 400,000 barrels of oil awaiting shipment at Ventura, transportation by railroad being prohibitive on account of the excessive rates.

## Personal.

JOHN MCMURRAY of Trinity Co. has returned from a month's sojourn on the Atlantic coast.

GOV. J. E. JONES of Nevada is reported dying at the Palace Hotel, this city, of cancer of the stomach.

J. W. SHERER succeeds J. E. Loomis as superintendent of the Rocky Gulch mine, Galice creek, Or.

S. MORRELL, of Portland, Me., succeeds S. E. Bretherton as superintendent of the Ivanhoe, New Mexico, smelter.

EDOUARD SALADIN, general manager of the Cis Fse mines, Junction City, Cal., has returned from a trip to Paris.

CHAS. HOFER, of Carson, Nevada, left this week for Douglass Island, Alaska, to do assay work for the Alaska-Treadwell Co.

J. H. PORTER of Montana has recently invested considerable money in quicksilver properties near Redding, Shasta Co.

CLARENCE E. STUMP has been appointed general manager of the electrical exposition to be held in New York City from May 4th to June 1st.

EDMUND HARVEY, who recently assumed the management of the Golden Gate, Rock River and other Butte county mines, has returned to England.

GEO. A. RICE, a Salt Lake banker, has been examining mining properties in Calaveras county, and it is thought the Sevier, Utah, Mining Co. will shortly secure an option on some mines therein.

ARTHUR WOOD has resigned the superintendency of the Camas No. 2 mine and mill, of the Fortuna Mining Company, at Hailey, Idaho; M. Flynn, superintendent of the G. V. B. Mining Company, succeeds him.

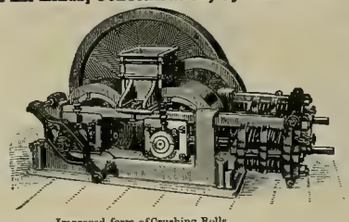
THE Angels *Voice* says that T. T. Lane has severed his connection with the Utica mine as assistant superintendent, and in the future will devote his attention to his interests in the Plymouth Rock mine at Jenny Lind.

T. H. LEGGETT, late superintendent of the Standard mine at Bodie, Cal., with his wife and brother-in-law, George W. Burrows, was obliged to flee from Johannesburg, South Africa, to Cape Town to escape the arrest that overtook Messrs. Hammond, Butters and Mein.

RUSSELL L. DUNN, a well-known mining engineer of Placer county, has in preparation a description of the mineral resources of that county, an authentic, conservative statement of facts, that he is about to publish in a volume of some 200 pages, giving up-to-date information of practical value.

EDWIN FIELDS, who at one time owned a large part of the city of Tombstone, Arizona, and a mine worth more than half a million, was last week taken to the Chicago hospital in the police ambulance. From the hospital he was taken to the poorhouse at Dunning, to spend his few remaining years.

## Commercial Paragraphs.



ESTABLISHED in 1864, the school of practical, civil, mechanical, electrical and mining engineering at 723 Market street, this city, of which A. Van Der Naillen is president, enjoys a deserved reputation for reliability. There are no vacations, and students are admitted at any time.

CHAS. C. MOORE, the manager, has a working model of the new wrought-steel sectional Babcock & Wilcox water-tube safety steam boiler on exhibition at the Pacific coast branch of the Babcock & Wilcox Co., 32 First street, this city. The model is a complete working boiler in detail, with all parts, fittings and appliances. This type of boiler has been brought into use by the growing demand for increased steam pressure, and the need for an economical safety steam generator for the advanced conditions of the present time. From a mechanical standpoint alone, one would be well repaid by an inspection of this model; and the company has at its office, in addition to the model, full-size sample pressure parts, the workmanship of which would certainly surprise any one who has not given special attention to the advancement in this class of boiler construction. The steel forgings differ from anything ever shown here before, and are simple and ingenious. From an inspection of the exhibits, it is easy to believe that the most efficient results can be secured; and the company's representative claims that the new construction possesses the following advantages: Freedom from strains due to expansion, perfect accessibility for inspection and cleaning in every part, thorough and efficient circulation, thin heating surface in furnaces, all straight tubes, no flat surfaces, stay bolts nor gaskets, joints removed from the fire, large draft area, complete combustion, thorough absorption of heat, quick steaming, dryness of steam, steadiness of water level, safety from explosion, great capacity for forcing, ease of transportation, being sectional, freedom from expense of repairs. It seems that a good deal is claimed for the boiler, but from what is shown at the office of the Babcock & Wilcox Co. it is not difficult to believe that the claims can be verified. This company has recently put in boilers of the wrought-steel construction for the Sutro Railroad Co., Commercial Steam Power Works and Pacific Power Co. of this city, and for the Giant Powder Co., Consolidated, Giant station. A new circular, entitled "High Pressure," is issued by the Babcock & Wilcox Co., giving a special description of the new wrought-steel boiler. This circular, also the well-known book "Steam," will be mailed free on application to Chas. C. Moore, Pacific coast agent, at 32 First street.

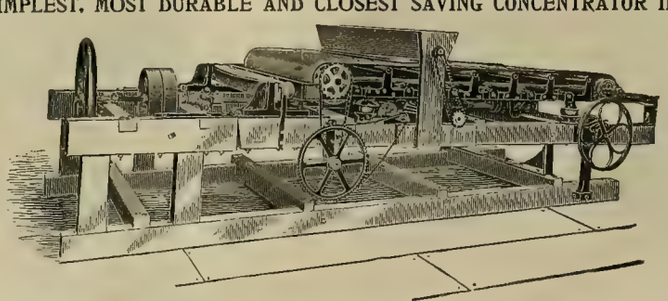
# The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.



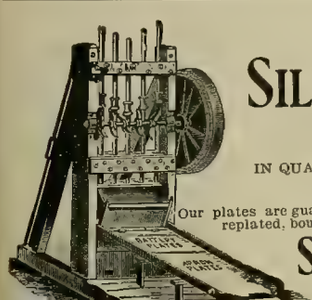
NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.
THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

NOTICE TO GOLD MINERS!

# SILVER-PLATED AMALGAMATED PLATES

For Saving Gold

IN QUARTZ, GRAVEL OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER.

AT REDUCED PRICES.

Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates replated, bought, or gold separated. THOUSANDS OF ORDERS FILLED.

# Market Reports.

## The Markets.

SAN FRANCISCO, Jan. 16, 1896.

Dull and depressed, small sales and weak prices characterized the metal market of the week. There is, however, a hopeful feeling in the trade, and an expectancy of active business, but the outlook is as foggy as the present weather. Cleveland, O., announces the price of Bessemer in '96 will be $4 per ton, an advance of $1.20 over last spring's quotations.

Silver shows an advance. London authorities on the movement of bullion estimate that shipments of silver to Asia in 1895 amounted to £6,000,000, a falling off as compared with recent years. On the other hand exports to the continent of Europe increased £2,500,000 over the previous year. Mexican dollars have been in good demand all over the East and the price has closely followed that of bar silver, with a premium of about 1½ per cent in favor of the coin. The imports of gold at London were large, amounting to £36,000,000, including £11,450,000 from the United States (to which, however, £3,275,000 was shipped) £8,200,000 from South Africa and £6,250,000 from Australia, while India and China shipped £3,300,000 to London.

## Mining Share Market.

SAN FRANCISCO, Jan. 16, 1896.

Occidental has been the most active stock. It moved up to $1.20, then broke to nearly 90 cents, and recovered slightly; but it looks as if it had seen its best for a short time at least. The Comstocks moved up slightly, with Hale & Norcross scoring the best advance, and then began to shade off. The strong tone to the market and slightly higher prices as usual brought in a few outside buyers, who found that the long-promised deal had set in. They also caused a few of the more timid shorts to fill. While the market acts as if a lower range of values will obtain, still there seems to be evidence that much better things are in the near future for weary assessment-racked shareholders. This opinion is grounded largely on the way in which the market is handled by the manipulators. The backing and filling at this season of the year are generally accepted as evidence that outside operators are to be made more tired and disgusted, so as to cause them to unload their holdings. Then, heavy sums of money are being disbursed by incorporated companies in dividends, which heavy sums are being paid out on interest accounts by government, State and county. This money will be seeking investment, and it is not at all unreasonable to conclude that persons largely interested in mining shares may give them a chance to put a few of the dollars into their rat-holes. To do this successfully values must be advanced and the market made attractive by lively fluctuations. This can be done on the showing already made in the mines, which can be magnified in the usual way by street points, vague hints and rumors. It may even be done on the election of A. G. Garnett, president of the San Francisco Stock Board, for he is well known to be an active and wide-awake broker of considerable means, and nothing offers him greater pleasure than to be in an active market. Perhaps he may be induced to join the bulls; at any rate, it looks as if a livelier market and higher prices will be seen shortly, but how high the market can be sent successfully time alone will tell.

The news from the Comstocks grows more interesting. The work under way and that outlined in the different groups ought to result in better things than has been seen for some time, but unless there is money or backing to any move that may be made on the showing in the mines, the market will not be sustained at any advance. In the Alta group an assessment of 10 cents has been levied in Alta so as to help in paying expenses incurred in exploiting the mine. The work seems to be largely of a kill-time character, yet they may accidentally run into ore. In the Gold Hill group the work is essentially unchanged from that reported in last week's PRESS. Those in position to know look for better things before the end of February in one or two of the mines. The work started on the east on the 1100-foot level of Crown Point is being watched, but if it was on a much lower level than that much better results would be looked for. On that level and several below considerable good to high grade ore was taken out in years gone by. It was good bearing ore too. It is thought that this work to the east may eventuate by running into old workings. In Belcher the work is to the west. From Yellow Jacket no news that comes is allowed to leak out, which causes many to be suspicious that something of importance is under way. But this kind of drawing on the imagination always obtains when the managers of a mine do not have much to report. It is queer people, these outside share operators; like a drowning man they catch at straws. In Confidence, Challenge, Con. Imperial and Alpha the usual reports come to hand. The managers of these mines are slower than death in relieving the sufferings of a consumptive. It is hope deferred that makes the heart sick. In the middle group they are still following stringers and prospects with the hope that better things may result from following them up, but this has been the order for months past and no great things have resulted from it. In Bullion and Gould & Curry the long winded west drifts are still being run, but as yet nothing of value has been struck. In Best & Belcher there is no change to report. In Con. Virginia active and seemingly energetic work is the order on several levels. It would seem as if by March, at the farthest, they ought to find something of importance. The prospecting work is said to be in the right quarter for finding something. It is not at all unlikely that the Jim Rule ore body may be found before the spring months pass. In Ophir and Mexican there is nothing new to report. Work is being prosecuted, as it has been for many months, in the right direction, yet nothing has so far come out of it except assessments. This kind of a strike is where shareholders draw the line. In Union and Sierra Nevada there is nothing new to report. Experienced miners watch the work with so much interest as to cause dealers to look for an ore strike. This may come in the course of human events. Andes is not mentioned nowadays.

On the Brunswick lode work is being vigorously prosecuted, but as yet without any exciting result. In Occidental the work done caused a slight flurry in the shares, but the good things reported either gave out or else the backers lack money to keep the values up. The work being done on the lode by the Comstock companies is reported as being actively pushed, but it is expected that more time will be required before anything tangible can be discovered.

In the Bodie district there is nothing of importance being done. They are still using up money trying to find ore on the upper levels of Bodie. Work will have to be done on still lower levels before it can be expected that much of importance will be found.

The following illustrates the changes of the week:

| Mines. | Jan. 9. | Jan. 16. |

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from John Spaulding in the Polar Star mine near Dutch Flat, Placer Co., and T. G. Phel s in the Liberty Hill mine, Nevada Co., to impound tailings in Bear River, and from Olonzo Engle in the Adkins mine near Ono, Shasta Co., to impound tailings in a ravine, gives notice that a meeting will be held at room 32, Flood Building, San Francisco, Cal., on Jan. 20th, 1896, at 1:30 P. M.

## WANTED!

### A COMPETENT ASSAYER AND ACCOUNTANT

IS OPEN FOR ENGAGEMENT.

Situation in some California mine preferred.

Address ASSAYER,

Care MINING AND SCIENTIFIC PRESS, No. 220 Market street, San Francisco.

**Wanted—Position as Amalgamator.**

Have a practical knowledge of how to work all free milling gold rock. Fifteen years experience in Australia and California. T. L. ANDREW, Grass Valley, Nevada Co., Cal.

# Assessment Notices.

JUSTICE MINING COMPANY. — Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of January, 1896, an assessment (No. 60) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 309 Montgomery street, Room 23, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of February, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 9th day of March, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. E. KELLY, Secretary.

Office—No. 309 Montgomery street, Room 23, San Francisco, California.

---

ALTA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Gold Hill Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of January, 1896, an assessment (No. 51) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of February, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 9th day of March, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. E. JACOBUS, Secretary.

Office Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

---

SAVAGE MINING COMPANY.—Location of principal place of business, San Francisco, California. location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the fourth (4th) day of January, 1896, an assessment (No. 88) of twenty cents (20c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 50, Nevada Block, No. 309 Montgomery str. et, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the sixth (6th) day of February, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 26th day of February, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. B HOLMES, Secretary.

Office—Room 50, Nevada Block, No. 309 Montgomery street, San Francisco, California.

---

WEST SIDE CANAL AND LAND COMPANY.—Location of principal place of business, San Francisco, California. Location of Works, Fresno and Kings counties, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 30th day of December, 1895, an assessment (No. 3) of one (1c) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 8, Floor 8, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of February, 1896, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 27th day of February, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. E. NAYLOR, Secretary.

Office, Room 8, Floor 8, Mills Building, San Francisco, California.

---

ANCHOR COAL AND DEVELOPMENT COMPANY.—Location of principal place of business, San Francisco, California. Location of Works, Kelso, Cowlitz county, Washington.

Notice is hereby given, that at a meeting of the Board of Directors held on the second (2d) day of January, 1896, an assessment (No. 6) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 632 Market street, Room 5, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the third (3d) day of February, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the fifth (5th) day of March, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. D. FARISH, Secretary.

Office, No. 632 Market street, Room 5, San Francisco, California.

---

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of December, 1895, an assessment (No. 21), of fifteen (15) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room No. 68, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assess ent shall remain unpaid on the 20th day of January, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of February, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 68, Nevada Block, No. 309 Montgomery street, San Francisco, California.

---

HITE GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the seventeenth day of December, 1895, an assessment (No. 2) of fifteen (fifteen cents) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, Room 27, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of January, 1896, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 10th day of February, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. E. MATHEWS, Secretary.

Office—Room 27, 120 Sutter street, San Francisco California.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR WEEK ENDING JANUARY 7, 1896.

552,685.—CALF WEANER—B. W. Bussell, Walla Walla, Wash.
552,704.—GAS COCK—Jos. Clark, S. F.
552,824.—BRAKE ROD—Cook & Scott, Woodburn, Or.
552,519.—CONCENTRATOR—H. R. Ellis, S. F.
552,750.—SLIDE CLAMP—M. J. Hawley, S. F.
552,769.—BELL RINGER—T. W. Heintzelman, Sacramento, Cal.
552,581.—FIRE ESCAPE—J. Knapke, New Pine Creek, Or.
552,870.—CURTAIN FIXTURE—J. W. Lang, Los Angeles, Cal.
552,633.—MOUTH MIRROR SUPPORT—O. P. Myers, S. F.
552,667.—EVAPORATOR—J. W. Mote, Wilbur, Or.
552,668.—FIRE ENGINE HARNESS—Thos. Murphy, S. F.
552,751.—TYPE WRITER—H. G. Perry, Suisun, Cal.
552,782.—BOX MACHINE—O. A. Sanford, Newcastle, Cal.
552,872.—FLUID MOTOR—J. Schade, Los Angeles, Cal.
552,624.—LEAD BATH APPARATUS—A. M. Shields, Oakland, Cal.
552,672.—INVALID BED—E. C. & T. D. Souney, Sacramento, Cal.
552,733.—ANGLE COCK—E. B. Stoner, Seaside, Or.
552,675.—VOTING MACHINE—G. J. Sweeney, Petaluma, Cal.
552,651.—SHIRT SLEEVE—W. F. Williams, Bishop, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FIRE ENGINE HARNESS.—Thomas Murphy, San Francisco, Cal. No. 552,668. Dated Jan. 7, 1896. This invention relates to a harness, a mechanism connected therewith whereby the harness is rapidly disengaged from suspending devices, and is automatically secured upon the horses. It consists of two-part collars hinged together at the top, adapted to close and lock at the bottom, mechanism for holding them in a normally open position, mechanism for disengaging the holding device and closing and locking the collars, a suspending yoke with an elastic retracting device, and pins by which the breeching is held up; a pulley with a cord having one end attached to one side of the collar, passing thence over the pulley and connected with a disengaging latch mechanism; a rod or bar fixed to the movable part of the collar upon which the latch mechanism is slidable so as to move from one end to the other when the collar is opened or closed; a spring suspending device acting to draw the front yoke upward when the collar has been disengaged, and thus tilt it until the breeching slips off, and the counterbalance acting to return the yoke to an approximately horizontal position when freed from the harness.

LEAD BATH APPARATUS FOR WORKING ORES.—Andrew M. Shields, Oakland, Cal., assignor to the Morosco, Shields & Bishop Fusion Co., San Francisco, Cal. No. 552,624. Dated Jan. 7, 1896. This invention relates to an apparatus in which molten lead is employed as a bath, and finely pulverized ore or sand bearing the precious metals is forced through the bath for the purpose of extracting the metal therefrom. It consists essentially of a pan having an inclined bottom, a chamber connected with the lower and deeper part of the pan adapted to contain molten lead, a channel carrier having a central shaft by which it is turnable, an annular groove or channel around its upper periphery, said carrier being adapted to receive the ore at the upper and shallower side of the pan and deliver it within the bottom portion of the chamber at the opposite side, hinged gates adapted to swing across the channel to carry the ore from its point of reception to its point of delivery and to be then turned out of the channel to allow the ore to be discharged, and means at the point of delivery for moving the gate out of the channel and lifting the ore therefrom so as to deliver it to the molten metal above.

VOTING MACHINE.—George Jay Sweeney, Petaluma, Cal. No. 522,675. Dated Jan. 7, 1896. This machine consists of a casing, which is preferably a transparent one, as of glass, said casing having within it one or more rotable cylinders, to the peripheries of which is secured a voting, or, as it may be termed, a "tally" sheet, the spaces upon which are adapted to be successively brought into alignment with an overlying slot, or opening, in the casing; a sliding stamp, mounted upon the casing beside said slot and adapted to operate through it to leave its impression upon the underlying tally sheet; means for intermittently rotating the cylinder to present fresh spaces of the tally sheet to the action of the stamp and other details of construction to complete the perfect operation. The object of the invention is to provide a machine by which the voter is enabled to register his vote for each candidate directly upon the tally sheet, thereby saving the time used in reading out the votes after the election is over and tallying them by hand; also, to provide for avoiding mistakes of carelessness, ignorance or dishonesty; to minimize the time of voting and to economize in the cost, generally, of holding an election, as well as to enable returns to be made in the shortest possible time and subsequent recounts to be had.

INVALID BED.—Edward C. Souney and Thomas D. Souney, Sacramento, Cal. No. 552,672. Dated Jan. 7, 1896. The object of this invention is to provide a bed in which a perfectly helpless patient may be turned from his back to his face and vice versa, and the mattress on which he has been lying removed for the substitution of another mattress to receive him in his changed position, thus not only relieving the invalid by a change of position, but also affording opportunity to change and freshen the bed. The bed consists of a frame having circular ends so supported that said frame may be invertibly rotated; and independent detachable mattresses to alternately support the patient. The detachable connection between the mattress and frame consists of a duplex twisted bar or hanger-screw which is provided with means for holding and relieving it, to keep it from or to permit it to axially rotate.

## New California Mining Companies Incorporated This Week.

The Jennie Gold Mining Company has incorporated in this city; directors, T. G. Flagg, W. Rutledge, J. J. Higgins, C. Johnson and S. Wilson; capital stock, $300,000, $250 subscribed.

The Charleston Gold and Silver Mining Company; principal place of business, Bodie; capital stock, $1,000,000; F. M. Jones, W. H. Netherton, N. J. Salisbury, M. Salisbury of Bodie and C. M. Buel of San Francisco, directors.

The Tuolumne County Mining and Development Company; principal place of business, Fresno; capital stock, $18,000; N. W. Moodey, T. R. Brown, J. Scott, J. L. Marble and H. E. Barnum of Fresno directors.

DIVIDEND NOTICE.

The German Savings and Loan Society,
326 California Street.

For the half year ending December 31, 1895, a dividend has been declared at the rate of four and twenty-six hundredths (4 26-100) per cent per annum on Term deposits, and three and fifty-five hundredths (3 55-100) per cent per annum on Ordinary deposits, free of taxes, payable on and after THURSDAY, January 2, 1896.

The Explorers' and Assayers' Companion.
A Third Edition of Selected Portions of the "Explorers', Miners' and Metallurgists' Companion."
By J. S. PHILLIPS, M. E.
A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy.
The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and discriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.
Price $6.00 postpaid. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Every Miner Wants It.
"The Sampling and Measurement of Ore Bodies in Mine Examinations."
Well Printed on Fine Paper, with Plates; Complete.

BOOKS ON WORKING ORES.
By GUIDO KUSTEL, M. E.
ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL, M. E.
This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.
By C. H. AARON.
AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco

# FRUE ORE CONCENTRATOR.

## OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.

# RISDON IRON WORKS,

SAN FRANCISCO, CAL.

## READ WHAT MINERS THINK OF THE BRYAN IMPROVED ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2200 to 2300 tons.

The mills require very little attention. At our mill an ordinary "peon," earning one dollar per day, has complete charge.

In regard to slimes, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK, Pres.
SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY,
S. BAMBERGER, President and Manager.
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,
[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO,
C. C. MCIVER, President; D. CUSHMAN, Secretary.
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. MCIVER, President.

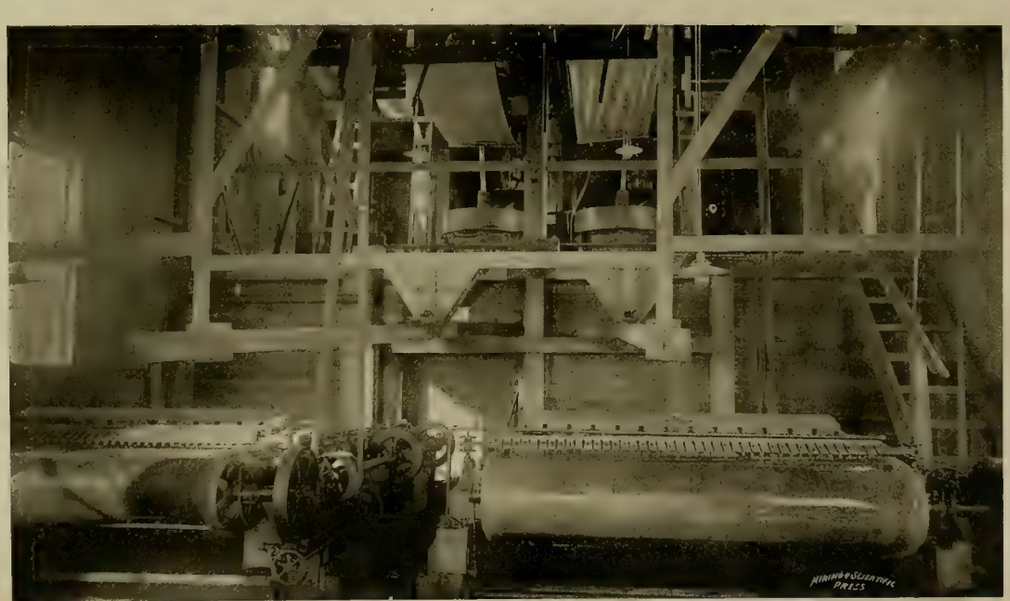
## The Kinkead Waste Rock Experiment.



Had any one in the bonanza days of '74-5-6 at Virginia, Nevada, prophesied that twenty years after effort would be made to extract profit from the waste dumps of the C. & C., he would have been laughed at. Yet this is just what is now being done, and, it would seem, with good promise of permanence. About a year ago Supt. Jas. H. Kinkead, an old and experienced Comstock miner, organized the Kinkead Mill and Mining Co., and since then he has been busy getting the proposed plant into practical shape. The MINING AND SCIENTIFIC PRESS has had photographs taken of the plant just as it began to be put into operation on the 4th inst., engravings from which appear on this page. On page 67 appears a sectional view of Supt. Kinkead's newly patented crusher. The matter is of considerable importance to every mining region on the coast where waste dumps of any magnitude have accumulated. Already the Kinkead plant is being visited by mining men from Bodie and elsewhere, and the project has attracted unusual interest.

The Kinkead Mill and Mining Co. was organized to work the Comstock waste dumps especially and any custom ores that may come to the mill. The mill is a concentrating plant, and there is nothing new about it except in lieu of stamps the Kinkead mill is used for crushing the ore.

This mill is the invention of Mr. Jas. H. Kinkead, superintendent of the Occidental and other mines, and letters patent were secured for him by Dewey & Co. The mill consists of a pan five feet radius on the inside, having a convex bottom declining outwardly from the center, with sides six inches high extending upwardly at right angles with the bottom. A false bottom or die is dropped into the pan and is held in place by wooden wedges. The crushing device is a muller weighing 2000 pounds, to which is bolted a shoe having a conical bottom with diverging sides, the concavity of the bottom being slightly less than the convexity of the pan bottom. A shaft six feet long is attached to the muller and is made to gyrate by a crank attached to a vertical shaft, which is secured to the timbers above the pan. The crank has a ten-inch throw; and when in motion, brings the surfaces of the shoe and die into contact and produces a gyrating motion, which crushes and grinds the ore. The crank runs loosely on the pan shaft, which allows the muller to raise in case too much ore is fed into the pan. The ore is fed into the machine automatically through the openings around the cone at the center, and the coarse rock is broken up by a ring having corrugated steps; and when broken to the size of a walnut, works out between the shoes and dies and is ground up and discharged through the screens which surround the pan.

THE KINKEAD MILL.

INTERIOR OF PLANT, SHOWING MILLS AND VANNERS.

The inventor claims for this mill that it will do the work of a five-stamp battery, with less than half the power required to run five stamps, and can be built and put in operation for less than half the cost of stamps. The only wear is the shoe and die, which is less than one stamp. Having what they conceive to be a cheaper device for crushing ore than in ordinary mills, the Kinkead Co. believe it possible to make money out of ore so low in value that it has been treated as waste and thrown away. The material taken from the dump is run out in cars and dumped onto a half-inch grizzly, experiments having shown that the fine or decomposed material was the best. All that passes through the screen is treated as pay ore and is run to the mill. The coarser rock is run to a dump to be picked over by boys, who sell their pickings to the company on a percentage of the assay. About 5000 tons of the screenings have been run out and piled up at the mill. The assay value is about $4, and the company expects to recover about seventy-five per cent of the assay. It is estimated that there is at least 200,000 tons of material in the Con. Va. dumps that will average $4 per ton coin value. There is considerable waste rock adjacent to the Con. Va. susceptible of the same general treatment, rich in pyrites and containing gold which, if this idea be successful, can be recovered. The present plant is experimental and consists of two Kinkead mills and two six-foot plain belt Frue vanners. Each mill will crush fifteen tons in twenty-four hours through a forty-mesh screen. The pulp passes over amalgamated plates into sizing boxes, and thence to the vanners. A No. 2 Pelton motor (twelve-inch), with a quarter-inch nozzle under a water pressure of 220 pounds, runs the whole mill.

The concentrates will be shipped and sold, for the present, but later on, when the plant is enlarged, they will be worked by the company on the ground.

Oldest Mining Journal on the American Continent.

*Office, No. 220 Market Street, Northeast Corner Front, San Francisco*

☞ *Take the Elevator, No. 12 Front Street.*

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada..... .....$3 00
All Other Countries in the Postal Union..... 4 00

*Our latest forms go to press on Thursday evening.*

Entered at the S. F. Postoffice as second-class mail matter.

J. F. HALLORAN.....General Manager

San Francisco, January 25, 1896.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Kinkead Mill: Interior of Plant, Showing Mills and Vanners. 61. A Picturesque Rustic Bridge in the Foothills of California, 65. Map of Calaveras County Mother Lode Region, 66. Sectional View of Kinkead Mill, 67.

EDITORIAL.—The Kinkead Waste Rock Experiment, 61. The Situation in the Transvaal; The Present Activity in Electrical Progress; An Electrical Contrivance to Cure Consumption of the Lungs; Senator Dubois' Bill; Suspended Publications; Attempted Mining Swindles; The Antagonism Between Miners and Farmers, 62.

SCIENTIFIC PROGRESS.—Reversal in Invention; The Human Skin; Telephone Acts as a Sort of Barometer; A Successful Airship; A New Mineral; A Deep Bore-Hole, 68.

MECHANICAL PROGRESS.—Doctor of Machinery; A New Blasting Method; A Terrestrial Globe, 68.

ELECTRICAL PROGRESS.—Electrical Reduction of Colorado Ores; A Recent Decision; Pittsburg Reduction Co. In Operation; A Machine to Record a Man's Thoughts; Westinghouse Electric and Manufacturing Co.; The Monocyclic Generator; New Electric Motors; The Duty of a Trade Paper; A Patent To Construct Ventilating Armatures for Dynamos, 69.

PRACTICAL INFORMATION.—To Protect Forests from Fires; Causes of the "Setback" of the Earth; Magnifying Power; Production of Manganese Ores; A Novel Use of Magnetism; A Mass of Muscle; Ancient Highways, 69.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories. 70-71.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 78.

MISCELLANEOUS.—Concentrates, 63. Mines, Miners and Monopolies; Notes on Gold Milling in California, 64. A Rustic Bridge; Milling in Miniature; Petroleum Production in the United States in '93 and '94; Automatic Photographs, 65. Calaveras County Mother Lode Region; The World's Greatest Gold Field, 66. Value of Foreign Coins; Lives Lost in 1895 by Battle, Accidents, Etc.; Mines and Mining in Nevada County, Grass Valley District; The Yarrow Aluminum Torpedo Boat; Lives Lost by Railroad Accidents in the U. S. in 1895; Amount Donated to Colleges and Universities in 1895; Loss of Life by Battle Last Year, 67. Essential Difference Between Ice and Granite; Notices of Recent Patents, 72. Coast Industrial Notes; Personal; Commercial Paragraphs; Obituary; Dividends Declared This Week; Mining Incorporations This Week, 74. One Day's Mining Incorporations, 79.

WITHOUT desiring to enter in any way into the present political discussion regarding recent sensational occurrences in the Transvaal, it is in order to suggest to some who lay stress on the unwarranted action of the "Uitlanders" that the principle opposed by the English and Americans in South Africa is precisely that objected to by the American colonists in revolutionary days—taxation without representation. In the case of the Rand residents, it is not only taxation, but extortion. True, "if they don't like it, they can leave," but human nature is the same the world over and the Kruger-Jameson-Hammond-Rhodes trouble will ultimately result in proper representative government and the triumph of what may be styled the American idea.

THE present activity in electrical progress is shown in the fact that in 1894 there were 1704 patents issued in this country on devices wherein electrical power is to be applied, in Great Britain 1130, in Germany 481. Of this total of 3315 there were 365 for improvements in dynamos, motors, armatures, field cores, etc.; 450 related to the distribution of electrical power, apart from its generation or transmission; 395 applied to electric lighting, and a lesser proportion to electric haulage in mines, electric welding, and electrolytic devices; telegraph patents numbered 103, telephone patents 220, and signalling by sound 457. Electric meters called forth 158 patents.

FROM New York City is wired the absurd statement that Nicola Tesla, the great electrician, has invented an electrical contrivance to cure consumption of the lungs. It may be that some empiric has what he imagines to be a consumption cure, but it is ridiculous to associate Tesla's name with any alleged therapeutical application of electric force. The method claimed is "to kill by vibration the bacteria." It is probable that if applied in the manner indicated the vitality of the unfortunate patient would be overcome before that of the bacteria. A good many widely advertised "electrical" remedies are weekly exploited, but till now the names of leaders in electrical science have not been used in the attempt to create confidence in statements that justly arouse distrust.

THE Denver, Colorado, *Republican* is doing good work in showing up some of the attempted Eastern mining swindles in connection with the Cripple Creek district. Every reputable paper in the country is interested in exposing and denouncing the wildcat schemes that the present mining activity is sure to produce. There are at present appearing in some Boston and New York journals alluring prospectuses that are fraudulent throughout. The people who are deceived thereby are the very ones who can least afford to lose their earnings, and since the proprietors of those papers admit such advertisements and statements so palpably false to the speculator, investor and capitalist, it is a duty that every other journal owes to itself and its constituency to head off and expose the fraud as fully as possible. To the credit of most of the Pacific coast papers be it said the proffered advertisements of these bunco men are flung in the waste basket. They should be exposed and their trade destroyed wherever practicable.

SENATOR DUBOIS' bill has passed the Senate, and, it is thought, will pass the House and become a law. It is represented to prescribe that twenty-five per cent of the purchase price of mineral lands shall be given to the several States for the creation and maintenance of schools of mines, but that is not exact, for, ordinarily, there is no regular "purchase," as the ground is taken up, held by annual assessment work, and when U. S. patent is finally secured the fees are but $5 an acre, one fourth of which would not be more than $20 in any individual case. However, whatever the accruing amount, it will not be declined. It is probable the disposition of the fund will come within the province of the Legislature. It is believed that in this State such amount, whatever it may be, could best be utilized by turning it over to the State University at Berkeley, which already has a finely equipped mining department, and which has turned out some creditable graduates. To attempt an independent mining school on the pittance to be derived from any operation of the Dubois bill would be a waste of time and effort. Congressman Johnson of North Dakota introduced a bill in Congress December 16th providing for a federal appropriation of $25,000 to each State and Territory for the establishment and maintenance of schools of mines or of mining departments in State Universities already established. The bill is now in the hands of the Committee on Mines and Mining. The bill provides for the first payment to be made June 30, 1897. It is not likely that the North Dakota bill will prevail. At every session of Congress for the last ten years such a bill has been introduced, but the one championed by Senator Dubois of Idaho is now nearer than any of its predecessors to becoming a law.

THE last issue of the Creede, Colorado, *News* to hand says the paper has stopped, and gives as a reason that the business men of Creede didn't appreciate it. That is nonsense. A publication of any kind lives because there is reason for its existence, and it dies when such reason ceases. So long as it is of use it will live; when its patrons realize that it is of no use to them it will die, unless in the rare case of some rich man publishing a paper or magazine for personal gratification. Probably the Creede business men did "appreciate" the *News* in the true sense of the word; hence its demise. When the *Alta*, the oldest newspaper in the State or on the coast, died some years ago, its editor, the versatile Mr. Irish, wrote a touching tribute to its own worth, saying, virtually, that the paper was too good to live. As a matter of fact, it died because the Southern Pacific had tired of carrying it and concluded to stop that source of loss. Very different is the suspension this week of one of the most honored of our exchanges. Reference is made to *Industry*, a monthly devoted to science, engineering, and mechanic arts, and edited by John Richards, a man of ability and practical experience. In the current issue Mr. Richards, with honorable frankness and in a spirit of good-humored candor, briefly says that he cannot afford to continue the publication of *Industry* on its present lines; that the patronage does not warrant the expense, and implies that he does not choose to change the original purpose or policy of the journal, even were such change to possibly result in its continuance. Between the lines he simply says some high ideals were not realized, and retires. Such retirement is honorable alike to Mr. Richards and the cause he has represented, and is in marked contrast to the pitiful plea of the Creede *News* publisher, who expires with a plaint of non-"appreciation."

A RECENT Washington press dispatch represented a California congressman as saying that two lawyers —Ford and Devlin—were responsible for considerable of the antagonism between miners and farmers, that each got $250 per month to keep up the agitation, and that it was to their interest to stir up strife. It is very unlikely that any man with intelligence enough to form an honest opinion on anything, whether in or out of Congress, made such remark, and its publication requires notice. So far as Mr. Devlin is concerned, he is a member of the Anti-Debris Association, an organization that mistakenly, but doubtless honestly, opposes the efforts of the hydraulic miners. He is its attorney, is in receipt of a good salary, paid by the counties in which the Association is strongest. It is fair to assume that he earns his money and is not averse to the continuance of the unwarranted antagonism that retards the proper development of the State. Regarding Mr. Ford, he is a prominent member of the California State Miners' Association, an organization that is working for the public good, trying to aid the hydraulic, quartz and drift miners of California, without other present or future promise of reward than the consciousness of being of some practical benefit to the mining interests of this State. Neither Mr. Ford, nor any other member of the Association with the exception of the secretary, has ever been proffered or has ever received one dollar of salary. The only salaried office in the Association is that of secretary. The incumbent is paid the munificent salary of $50 a month; he, like the other officers and members, practically works for the common good, without any compensation. Mr. Ralston, upon retiring from the secretaryship last November, donated nine months' salary—$450—to the Association. It probably costs Mr. Sonntag, the present secretary, more than the nominal salary received to attend to the requirements of the position, and the same might have been said of his predecessors. There is little enough encouragement at best to men who are working for the public good, without having such ungracious slurs wired from Washington, intimating that they are simply "in the thing for what is in it." It is on a par with that other despicable assumption that "every man has his price." There is enough of that feeling in this State now, without further promulgation of it from the seat of our national Government. It is but due to the California Miners' Association and all connected with it to say that so far as that organization is concerned the statement is false.

IN self-defense and as a measure due to its own dignity, the Manufacturers' and Producers' Association some time ago issued a notice that in no way was it connected with any assumed "organ," and that no publication was in any way authorized to represent itself as being under its patronage or auspices. All great movements have their parasites, and from the inception of the Manufacturers' and Producers' Association there has been manifested a desire in some quarters to make personal profit by representing that the prestige of the Association is applied to sundry publications. The officers and members of the Association thoroughly understand this and rightly regard any effort on the part of such publications to secure business by claiming such authorization or official representation as a case of attempting to obtain money under false pretences.

## Concentrates.

WITH Utah in the firmament, Arizona is now the rising star.

THE Mountain Mines Co., Shasta Co., is reducing its building force.

THE Sierra County Miners' Association has sent $50 to the State Association

THE electric plant at the Rawhide mine, Tuolumne Co., will be ready about March 1.

COCHITI, New Mexico, confidently announces that nothing can prevent a "boom" there this year.

IN '95 the Witwatersrand, South Africa, gold product was 2,295,207 ounces; in '94, 2,024,159 ounces.

SIXTY new mining locations were filed in the Shasta county recorder's office for the week ending Jan. 18th.

ROCK CRUSHING at the Clover mine, Amador Co., has been resumed. The mill has been rebuilt throughout.

THE *Transcript* reports the sale of the Constitution, Mammoth and Siam quartz mines, adjoining claims, Willow Valley district, Nevada Co., to P. Tautphaus of this city for $10,000 cash

SUPERINTENDENT E. A. FRENZEL, Dover mine, Humbug Canyon, Placer Co., has twenty men at work. The 10-stamp mill is running.

THE Maxwell mine, in Big Cottonwood canyon, near Salt Lake, is the first mine in Utah to be operated entirely by electricity.

THE Washington State board of examiners of applicants for the position of mine inspectors have examined D. Edmonds of Seattle, J. James of Tacoma and J. Chapman of Burnett for the position.

THE Hall Mines smelter, Nelson, B. C., has begun operations. It is a water-jacket stack of latest style, with a daily capacity of 100 tons.

THE Northwestern Miners' Association now has 4000 members. At the Spokane, Wash., meeting on the 22nd prox., an "official organ" may be selected.

THE photographs from which the engravings illustrating the Kinkead mill articles in this issue were made were taken by E. B. Yerington, Virginia, Nevada.

COLLERVILLE, Mariposa county, is a prosperous mining town. During the past year it has doubled in population, and 132 new buildings have been erected.

N. B. CASSIDAY, a Colorado miner, has patented a combination dinner bucket and lantern, which, in certain cases, might be a handy arrangement.

"GOLD is at a premium of one per cent." So says the Wall Street *News*. It's been at a bigger premium than that for the past three years, though not noted in that particular form.

THE Marysville *Democrat*, whose editor was a prominent member of the convention, says the Johnson bill for river improvement was not indorsed by the River Improvement Convention.

THE Setting Sun Gold Mining Company has been incorporated in Oakland to dig for gold in California and Nevada. The capital stock is $100,000, of which $99,930 remains to be subscribed.

SENATOR TELLER is reported in Denver to have telegraphed to a Colorado mine owner: "Hold on to your silver properties. The price of the white metal will reach 85 cents by April 1, 1896."

AT the Gold Valley mine, near Downieville, fifty men are employed, the daily product being about 45 tons ore. There is a 25-stamp mill and chlorination plant. The mill and hoisting works are lit and operated by electricity.

A DISPATCH from Pierre, S. D., says that within a few months there have been organized twenty new companies, with a combined capital stock of $20,000,000, for the purpose of developing the Black Hills gold-mining properties.

THOUGH there was a little too much of a good thing in some parts of the upper Sacramento valley and foothills, last week's rain means to the mining industry of the State an increase of nearly half a million dollars a month in the gold output.

CONGRESSMAN SHAFROTH'S bill regarding the practical fencing in of mining claims has not yet passed either house. In the improbable likelihood of it becoming a law it will be rough on the prospector, who hasn't generally got a lumber yard at his command.

THE output of the De Lamar, Idaho, mine for 1895 is given out as follows: Tons of ore crushed, 43,680; amount of bullion sold, $827,472.27; value of ore shipped, $106,622.30; revenue from other sources, $1805; total receipts, $835,899.57; expenses incurred, $469,807.85; net profits, $466,091.72.

IN Butte county the Magalia property, formerly known as the Pershbacker, is proving satisfactory, pay gravel having been struck in the new shaft this week. The owners of the Princess, on the ridge adjoining, are putting in steam pumps and expect golden returns the coming season.

IN Shasta, Mariposa and Nevada counties over one million dollars is being invested in mining properties and improvements, each project—the Iron Mountain, Merced G. M. and North Star—involving preparation and appliance that require new methods which have passed the experimental stage.

IT is unfortunate that Speaker Reed saw fit to ignore California, which has no member on the House Committee on Mines and Mining. Any recognition of mining requirements in this State during this Congress, manifest though they may be, can only be secured by constant representation and hard work.

THE statement of Receiver C. P. Mason of the Salt Lake, Utah, Copper Manufacturing Company, for the quarter ending December 31st, shows receipts $29,077.19, disbursements $17,697.48, balance on hand $11,379.71. The smelter will shortly resume operations. Utah can furnish 1000 tons per day of $6 average value.

LAST Monday the Debris Commissioners granted permits to the following mines at their meeting: Manzanita, near Sweetland, Nevada county; Jay Bird, near Camptonville, Yuba county; Atkins mine, near Ono, Shasta county; Kanaka Flat, near Spanish Ranch, Plumas county. The Goyan mine, near Diamond Springs, El Dorado county, was given permission to build a dam.

STATISTICIAN YALE of the U. S. Mint is sending blank statements to mining superintendents throughout the State asking that they be filled out and returned. The information thus received is always of a confidential nature, the purpose being to secure correct official record of the gold output of the State as far as possible. The result inures to the general benefit of the mining industry.

AT the De Lamar, Idaho, mine the Pelatan-Clerici process is used. The ore, being first reduced in the ordinary way, is placed in a tank and reduced to a pulp. The chief dissolving agency is cyanide of potassium, the values being precipitated by electrolysis and deposited in a bed of quicksilver at the bottom of the tank, from which the contents of the ore are taken in the form of an amalgam.

FROM Grant's Pass, Oregon, J. E. Spires writes that he wants to sell asbestos, that he has a two-foot vein of fine fiber. If Mr. Spires is correct in his statements he has a good thing. There is a great and growing demand for asbestos, nearly 90 per cent of the country's supply being imported from Canada. In '94 San Diego county, this State, produced fifty tons of this fibrous talc, worth $2250.

TRACKLAYING at the Mountain mines, Shasta county, has been resumed. The company has begun work on the ditch to take water out of the Pit river about a mile above its junction with the Sacramento. The water will be piped across the Sacramento and the railroad and brought on down to Keswick, a distance of seventeen miles. A foundry and machine works will be erected at Keswick, where the company will make their own cars, etc.

THINKING that it was the Idaho-Montana mineral land bill as applicable to California that Congressman Johnson introduced, the Sacramento *Record-Union* editorially "pitched into it," but since it found out its mistake and that the bill introduced is acceptable to the railroad company, it has withdrawn all opposition and contents itself with decrying hydraulic mining and the earnest efforts of the miners to secure justice in the national legislature.

AN avalanche on Dec. 28 totally destroyed the stamp mill and entire surface plant of the Ebner Gold M. Co. in Upper Silver Basin, Alaska, and killed the watchman, J. F. Pearl. Wm. Ebner estimates his loss at $40,000. A. Sutherland, the watchman of the Juneau Mining Co.'s mill, adjoining, saw the avalanche descend, but said nothing of it and made no effort to find Pearl's body, or save him. The accident was not discovered till ten days after.

THE report of Surveyor-General Straughan, of Idaho, shows that eighty-three mining claims were surveyed for patent in Idaho during 1895. The applications for patent increased nearly 300 per cent over the previous year. The Surveyor-General states the operations are especially large in the gold-producing properties, although silver mines of known value and those of promising character are either being worked or placed in condition for renewed activity.

AMUSING things are sometimes noticed in the business office of this journal. Mention was made at the time of the man who insisted on paying his subscription in advance to the end of the century—Dec. 31st, 1900. Last week a Montana man, renewing his subscription, said he thought it was only fair to add a dollar—sending four dollars—and was further prompted to say that he would not be without the paper if it cost $20 a year. There are a good many like him, and such feelings are most cordially appreciated.

THAT the Virtue is a good mine, and deserves all the good things that can be said about it, does not justify the following from an exchange:

> An eighteen-inch streak of quartz in the Virtue mine near Baker City is so near pure gold that San Francisco jewelers pay $22 an ounce for it as it comes from the mine. The gold is so thick that it will not go through the screens in the stamp mill, which has to be stopped in order that the gold may be gouged out.

Such silly lies should be left to balloon promoters of wildcat schemes. No miner would take any stock in such stuff.

WASHINGTON, D. C., reports that the fact that the rich gold region on Forty Mile creek, Alaska, belongs to the United States has been accurately determined by an employe of the British Government, and General Duffield, Chief of the Coast Survey, says the survey shows but sixteen miles of the creek as the bird flies, and twenty-three miles as the water flows is in British territory; and in this portion no gold has been discovered. All the remaining of the creek is in Alaska and belongs to the United States. A bill has been introduced in Congress providing for the appointment of commissioners to fix the boundary.

ON Wednesday last Judge Seawell rendered a decision of interest to holders of stock in mining companies. Theodore Fox had brought suit to have the recent election of Con. Va. directors set aside because one of the trustees had voted stock which did not appear on the books in the name of the real owner. Under Section 3 of the act of April 23, 1880, relating to mining corporations, the name of the real owner must appear on the face of the stock or from the books of the corporation. Judge Seawell held that section is unconstitutional, being special legislation, and confirmed the election of the defendants as directors.

WORK is being pushed on the Goleta mine at Copper mountain, Mono county. Ore running from $8 to $10 a ton in gold has been struck, and preparations are being made for working the mine on a large scale as soon as the weather permits. A flume, ditch and pipe line will be built from a point on Mill creek, two miles distant from the mill site; these can supply 600 inches of water, with a fall of 300 feet. A forty-stamp mill will be erected as soon thereafter as practicable. The superintendent writes that the men are now working in an ore body over 100 feet in width, and that there is abundant ore uncovered to keep the mill employed for some years.

THE recuperative power of the American miner is well illustrated in Colorado. Two years ago the culmination of the silver depression left many of the Colorado miners apparently with occupation gone. They immediately began developing that State's gold resources, with the result that last year's gold output in that State exceeded the value of the silver yield, and it is thought that this year's aggregate of gold production in Colorado will exceed $16,000,000. The same thing applies to Utah. Mercur, in the Camp Floyd district, was one of Utah's great silver camps. With the slump in silver came ephemeral depression, quickly followed by gold discoveries; and to-day Mercur is such a promising gold producer that a local paper calls it "the Johannesburg of America."

A SOUTHERN CALIFORNIA summary says that there are in Los Angeles about 175 people who are operating mines in southern California, with a capital of over $2,000,000 invested. There are in Los Angeles county seven mills and about 275 miners working. Kern county has 25 mills, with 500 miners; Riverside county 28 mills, with 900 miners; two of the mills are twenty-stamp, and in one district; at Perris there are 175 miners earning $3.50 per day. San Bernardino county has 35 mills and 950 miners; it has the Gold Cross in the county with 110 stamps and 950 men working for good wages. The total number of mills in southern California is 120; number of stamps, 840; total number of men working for wages at mines, 1500; total miners and prospectors not working for wages, 2000; total capital invested in mines in southern California, $10,500,000.

RECENT minining decisions, in brief, are to the effect that "the Government is always a party in interest and may insist on a judgment of cancellation if the evidence clearly shows a failure to comply with the law, whether the protestant is entitled to such action or not;" "where an entry is thus canceled the right of the protestant as a preferred entryman will not be determined until such time as he seeks to exercise the same;" "where the plat of survey does not correspond with the field notes it should be corrected so as to exhibit the subdivisions called for by the field notes;" "a hearing as to the agricultural or mineral character of a number of tracts of land claimed under a railroad grant, and a judgment thereon that specific tract included thereunder is not agricultural, will not preclude a subsequent inquiry as to the character of such tract on the protest of a mineral claimant prior to the issuance of a patent therefor, if the showing made is clear and convincing."

THE famous Dred Scott decision of forty years ago figured in a U. S. Land Office decision in El Dorado county last week. Near Greenwood, Thomas Bolton, a colored man, claimed some land under pre-emption. The railroad company claimed it was within their grant. The corporation acknowledged that Bolton had settled upon the land before the grant was made to them, but held that he so settled on the 26th day of March, 1864, which was prior to the passage of the Fourteenth Amendment, and he could not, therefore, have been a citizen. In giving his opinion, Assistant Commissioner E. F. Best says: "I am constrained to hold in the light of the doctrine announced by the Supreme Court in the Dred Scott case, that at the date when the railroad grant attached to lands in the vicinity of the tracts in controversy, Bolton was not a citizen of the United States, and, accordingly, that he was not a qualified claimant under the public land laws."

REGARDING pending mining legislation by Congress for this State, Congressman Barham says: "I have the honor and distinction of having lived in California since September, 1849, and am fully in accord with the great mining interests of your State. I shall support measures which tend toward permitting the miner to work his mine, at the same time guarding the rights of the farmer and preserving navigable streams. I think it is the duty of the Government to construct dams, impound debris and do all things necessary to allow mines to be fully operated. This work should be done by the Government, so as to protect the farmer in carrying on his farm and so as to preserve navigable waters of California. There is not the slightest reason for a conflict between the farmer and miner on this subject. It is of the utmost importance to the farmer that the mining interest of our State should be fully developed. It produces a home market for much of the products of his farm and puts in circulation millions of dollars of gold."

COLORADO STATE COMMISSIONER OF MINES LEE has prepared a set of rigid rules for the protection of miners against accident and death, which rules will hereafter govern mine operators, and heavy penalties are prescribed for their violation. They revolutionize metalliferous mining in Colorado. In brief, the regulations require that explosives must be stored in magazines prepared for that purpose alone, far enough from the workings to prevent accident in case of explosion. Not more explosives than necessary for one day's operations shall be kept in a mine where work is going on. Under no condition will powder be allowed stored underground where men are working. Steam or water baths must be used for thawing powder; no miner may carry powder about his person. All boiler plants must be provided with a hose for emergencies. A uniform code of signals is established, violation of which will entail discharge of employes from service, on penalty to the employer; no man may use the shaft cage or bucket "at his own risk" as heretofore. Daily inspection of machinery and workings in mines where machinery is employed is required. Reports to the mine superintendent are to be made daily. Other important regulations are prescribed. This action on the part of the commissioner is the result of the terrible loss of life occasioned by the recent mine disasters in that State.

THE receipt of the *Inter-Mountain Mining Review*, a new publication just started at Salt Lake City, Utah, brings to mind the enormous increase in mining papers in the last year or two. Perhaps nothing better illustrates the great activity in the mining industry in this west half of America than the recent journalistic efforts in that line. Among the many new mining publications that have begun coming weekly and monthly to this office are the one just mentioned, the *Western Mining World*, published at Butte, Montana, the Grants Pass, Oregon, *Mining Journal*, the Gold Hill, Oregon, *Gold Miner*, *The Bullion*, Los Angeles, Cal., the Spokane, Wash., *Northwestern Miner*, the Baker City, Oregon, *Gold and Silver*, the Fort Jones, Cal., *Reporter*, the Sierra, Cal., *Leader*, the Black Hills, South Dakota, *Mining Review*, the Cripple Creek, Colorado, *Prospector*, the Cripple Creek *Mail*, the Jerome, Arizona, *News*, and others. Besides these there are three or four new publications with indirect reference to mining and industrial interests recently started in this city, Los Angeles and Portland, Oregon. Probably no department of business exhibits such activity. Of course the projectors of all of these enterprises figure on the laws of supply and demand and the fact of investing their money and effort show their faith in the matter. This is said solely with reference to this part of the world; elsewhere throughout the world is exhibited the same activity, though in a lesser degree. Every week comes a new mining publication just started somewhere, showing more or less merit and destined to live or languish according to its merits, and the amount of legitimate patronage bestowed upon it.

## Mines, Miners and Monopolies.

Written by J. A. EDMAN.

NUMBER II.

The mineral lands of California are chiefly represented in the gold belts of the Sierra Nevada and Coast Ranges, and may be defined as follows: The Main Gold Belt, the Southern Belt and the Northern Belt. For the first division I quote the general description by the U. S. Geological Survey: "The gold belt of California includes that portion of the Sierra Nevada lying between the parallels of 37 deg. 30 min. and 40 sec. This area is bounded on the west by the great valley of California, comprising about 17,000 square miles. The Sierra Nevada here forms a single range, sloping somewhat abruptly towards the great basin, and gradually towards the great valley of California. Within this area lie the chief gold deposits of the State, though by no means all of the area is auriferous.

"At the northern limit the deposits are scattered over nearly the entire width of the range, while to the south the productive region narrows down to small dimensions. The mass of the range north of Alpine county is comparatively barren. North of the 40th parallel the range is probably not without deposits, but the country is flooded with lavas which effectually bury them."

For the general geology I quote also from the Geological Survey:

"The southern portion of the range is composed of granite. The central and northern part west of longitude 120 deg. 30 min. consists prevailingly of schists, which have been produced by intense metamorphism of both ancient sediments and igneous rocks, and it is chiefly, but not solely, in these schists that the auriferous veins occur. The trend of the bands of altered sediments and of the schistose structure is generally from northwest to southeast, parallel to the trend of the range; but great masses of granite and other igneous rocks have been intruded among these schists, forming irregular bodies which interrupt the regular structure and which are generally bordered each by a zone of greater metamorphism. These schists, with their associated igneous masses, form the older of two great groups of rocks recognized in the Sierra Nevada. This group is generally called the 'Bedrock Series.'

"Streams flowing down the western slope of the Sierra Nevada in the past distributed another formation of great importance—the auriferous gravels. The valleys of these streams served also as channels for the descent of lavas which poured out from volcanoes near the summit. Occupying the valleys, the lavas buried gold-bearing gravels and forced the streams to seek new channels. These have been sunk below the levels of the old valleys, and the lava beds with the gravels which they protect have been isolated on the summits of ridges. Thus the auriferous gravels are preserved in association with lavas along lines which descend from northeast towards southwest across the trend of the range. The nearly horizontal strata, together with the auriferous gravels and later lavas, constitute the second group of rocks recognized in the Sierra Nevada. Compared with the first group—the Bedrock Series—these may be called the 'Superjacent Series.'"

The above geological features, while distinctive of the main belt, apply also in varying degrees to the other belts. Actually, the main belt continues southward from latitude 37 deg. 30 min. through the counties of Fresno, Tulare and Kern, gradually turning southward, then southwesterly, and becoming narrower until it may be said to cease somewhat west of Tejon Pass in the Tehachapi Range.

The Southern Gold Belt starting at the junction of the Sierra Nevada, with the Coast Ranges in the northeastern part of Ventura county, extends through the center of Los Angeles county, thence through Riverside county into San Bernardino, and finally through San Diego county to the Mexican boundary line. This belt, narrow in its northern part, gradually widens and at the center of San Diego county attains a width of about forty miles. It consists essentially of granite, with small bodies of crystalline schists, and it contains also old gold-bearing channels, which so far have been but slightly explored. Gold mining in this belt has not been extensive, chiefly from climatic causes, but also from the existence here of land grants. The most important gold mines are found in the Julian district in San Diego county.

East of the Sierra Nevada, and within the great interior basin, a mineral region but little known and explored extends from the northern part of Mono county, through Inyo, San Bernardino and San Diego counties southeasterly for a distance of 470 miles to the Colorado river and Mexico, and from the Sierra Nevada to the eastern boundary of California. Within this vast region, irregular mountain ranges appear wherein numerous gold and silver mines have been opened and profitably worked, and a large portion of these elevations will prove to be mineral land. Their geology is yet obscure, but presents some features in common with the Sierra Nevada. This region may be designated as the Great Basin Mineral Belt of California.

In the northwestern part of Plumas county the auriferous rocks of the Sierra Nevada are covered by the recent volcanic deposits which, radiating from Lassen's Peak, have extended not less than fifty miles on each side and even into the Sacramento valley, thus forming the northern boundary of the main belt. This volcanic region is generally devoid of useful minerals except on its eastern confines, at Hayden Hill in Lassen county, and contains desert, agricultural and timber lands. Its geology, topography and scenery have been most graphically described by Mr. J. S. Dreer of the U. S. Geological Survey.

The auriferous rocks emerging from the western edge of the volcanic deposits form the Northern Gold Belt, extending thence to the Pacific ocean. Its eastern boundary up to the Oregon line is marked by the non-auriferous volcanic rocks of the Mount Shasta and Lassen Peak flows, along a line but little eastward of the Oregon division of the Southern Pacific railroad; its southern limit may roughly be marked by a straight line drawn from Red Bluff to Trinidad Head on the coast. It covers an area of 10,000 square miles, and in its geological features is closely related to the main belt, being in fact the continuation of the Sierra Nevada, which already in Sierra county had lost its distinction of a well-defined mountain range, and within the northern belt broadens and divides into many irregular ridges. Placer mining has flourished here for many years, as well as vein mining. Ancient auriferous gravel channels occur at many points, as well as gold-bearing beaches, and a notable auriferous conglomerate deposit has been explored in its northeastern corner, but these latter classes of mines have not here been as fully developed as in the Main Gold Belt.

As a typical exposition of the gold rocks of California; as covering the first gold discoveries in the State; as the field for the most extensive, thorough and well-conducted gold mining of the Pacific coast; and last, but not least, as being the territory covered by the first railroad land grant in this State, the mineral lands of the Main Gold Belt should receive our first study, as from the testimony here to be obtained, and the conclusions to be drawn therefrom, an inquiry into the mineral characters of the other gold belts will become much simplified.

The center of this gold belt, and largely within the Central Pacific land grant, has also been the field of the most thorough work of the United States Geological Survey, as shown by the three folios now published of the Sacramento, Placerville and Jackson sheets, on all of which topography, as well as economic and structural geology, have been carefully delineated.

From the inception of the State Geological Survey of California under Professor Whitney, and to its untimely close, a large part of the territory within the Central Pacific land grant was mapped and thoroughly explored, and specially the auriferous gravels fully described, chiefly within the counties of El Dorado, Placer, Nevada and Yuba, and the experience then gained of the geology and economic conditions of the gravel deposits of this region were given to the public in Prof. Whitney's great work, "The Auriferous Gravels of the Sierra Nevada of California," and became a household word since 1880.

From the day of Marshall's discovery of gold at Coloma, hundreds and thousands of miners have been at work on the rivers, creeks, gulches and flats. Later these indomitable men pierced the holes, seeking for the deep gravel channels, while others found the quartz veins and followed them to the depths for hidden treasures. The hydraulic miner brought the streams from the snows of the high Sierra, and with infinite patience, labor, skill and expense carried them for many miles to the deep gravel beds to produce an annual revenue of more than ten million dollars. And the chief field of this activity was within the counties of El Dorado, Placer, Nevada and Yuba, and within the limits of the now vastly expanded C. P. land grant.

From the earliest days of gold discovery in California the U. S. Government had freely offered the occupation and use of mining land to its citizens under simple regulations, chiefly made by themselves, and it was in reliance on the premises thus made that California developed into a great State and more than a thousand millions of dollars were added to the wealth of the United States.

Much of the land thus open for mining was not surveyed until later years. The distinction between odd and even numbered sections did not exist, or had no practical significance to the miner, relying on the honor and justice of the Government.

Meanwhile, in the hour of our country's peril, a horde of shrewd speculators conceived the project of Pacific railroads, and by a combination of political forces succeeded in obtaining government aid in bonds fully equal to the cost of the roads, and to perpetuate their power revived in full perfection the odious and dangerous system of land grants—first on a small scale and later in enormous proportions. However, the enabling acts of Congress exempted mineral land from the operations of the grants, which allayed the fears of the miners that their possessions would be absorbed. How hollow this defense was, how soon it was undermined and finally set at defiance by the combined monopolies, the sequel shows, as well as the page of history.

Meadow Valley, Cal., Jan. 18, '96.

## Notes on Gold Milling in California.

NUMBER XI.

By E. B. PRESTON, M. E., Field Assistant State Mining Bureau.*

GRINDING AND AMALGAMATING MACHINES.

*Arrastras.*—Although the arrastra has been largely superseded by the stamp-mill, the fact remains that it is the best and cheapest all-round gold-saving appliance we have. Hence, its use is always indicated where small, rich veins are worked in the higher mountain regions, but it is also found valuable placed below the present quartz mill, where the waste waters from the mill can be picked up and used over again for power on horizontal or overshot wheels. In these cases, it handles the tailings from the mill after they have passed over the concentrators and canvas-plants. This part of the milling is usually leased to parties who pay the mine a fixed amount per ton for the tailings, the lessees putting up all their own machinery. The arrastras are built of a size to handle at least four tons of tailings in twenty-four hours. Their foundations are either formed of hard rammed clay, concrete, or a plank platform with broken joints, on which a bed of clay is placed. The foundation is always made larger than the circumference of the proposed arrastra. The bed is formed of rocks harder than the substance to be crushed, usually fine-grained basalt, granite, or quartzite. These are picked with a partially level surface, and as near of the same thickness as possible, usually from 1 foot to 2 feet thick. They are built around a center cone, forming an annular ring from 2½ feet to 6 feet wide, and are laid with narrow spaces between each rock, into which dry clay should be tightly rammed to within an inch of the surface. The outer circle is formed of rocks or staves, with rammed earth behind, and built from 2 feet to 4 feet in height. On the central cone, which consists of stone or a block of wood, and which stands somewhat above the paved bottom, a center post is let in, from which project four arms at right angles to each other, and extending nearly to the outer circle. Heavy, hard rock-drags, weighing from 200 to 1000 lbs. each (from 400 to 600 lbs. is the usual weight), are attached to the arms by ropes or chains passing through the eye-bolts secured in the rock-drags. They are placed so that part of them drag near the cone, with the inside corner slightly in advance, while the remainder sweep near the outer circle with the outer corner in advance. The front edge should always be slightly elevated, so as to permit of the particles passing under the drag instead of being pushed ahead.

Where a horizontal wheel is used, the arms are attached to the center post and the wheel encircles the arrastra, the water striking on buckets set to an angle of 45°. With overshot wheels the arrastra may be run by a belt and pulley attached to the center-post, or by a spur gearing. It requries about 6 H. P. to run an average-sized arrastra. Running tailings, a speed of fifteen to thirty revolutions per minute is given; crushing ore, the arrastra should be run slower and the pulp thicker.

For discharging the arrastra, plug-holes at different levels are put into the outer circle, leading the pulp into sluices lined with plates, riffles, and blankets. In some cases the arrastra has been made to work continuously by fitting a screen to a part of the outer circle and letting it discharge into a line of sluices. As the arrastra bottom and drags are extremely uneven and rough when first set up, some coarse sand and water are introduced on first starting and the drags are allowed to run slowly until somewhat smoothed down, before the regular charge is introduced. The machine is usually only cleaned up thoroughly when the bottom is worn away; between times the crevices are picked out for the depth of an inch or two with picks, scrapers, and spoons, and panned out, with what pulp remains on the bottom, after the charges have been successively thinned down and run off through the plug-holes. If crevicing has been done, a little fresh clay can be rammed in to within 1 inch of the top of the bed. During the grinding of the charge, the quicksilver is introduced through a cloth; the amalgam should be kept drier than in the stamp battery, though not sufficiently so as to become "crumbly." Great attention must be paid to tamping the bed in solid, otherwise an excessive loss of quicksilver may occur. Continual horn tests of the pulp furnish a guide for the proper working.

Machines have, from time to time, been introduced in California to replace stamps, claiming to do more effective work, both as regards the crushing as well as the amalgamating. Those mostly seen in operation, and finding the most favor, are the Huntington and the Bryan mills, which may be taken as types, and which reduce the ore by a continuous rolling motion; in the one case the roller acting on a ring on the circumference, and in the other on dies in the bottom.

*The Huntington Mill* consists of a shallow iron pan with a central cone, through which an iron shaft revolves. Bolted on the sides of the pan and inclosing it, are semi-circular iron sections made in two halves and also bolted together; one of these sections con-

* Bulletin No. 6, California State Mining Bureau.

tains an opening about 9 inches deep, divided into three parts, into which curved iron screen-frames are keyed, while the other section contains a feed-trough, attached near the top. Between the bottom of the pan and the lower edge of the screen-frames an iron or steel ring die fits against the sides of the shallow pan, being secured by wooden wedges, against this die, four rollers, suspended from yokes resting on an iron cover, revolve, receiving their motion from the central shaft. These suspended rollers are pressed by centrifugal force against the ring-die. Each roller is encircled by an iron or steel shoe fastened by wooden wedges; this can be renewed when worn too thin, or when it becomes unround—flattened. Means are provided for lubricating the shafts on which the rollers work without permitting the lubricant to come in contact with the pulp. As the rollers hang about ½ inch above the bottom of the pan, scrapers are attached to the revolving cover between the rollers, and reaching to the bottom of the pan, to prevent the baking of the pulp.

The size of the pan most frequently used is 5 feet in diameter, though for prospecting purposes one of 3½ feet is also made; the former is run at a speed of seventy revolutions per minute, the latter at ninety revolutions. They are provided with self-feeders, which introduce the ore at regular intervals—the only way in which they can be operated, though not correct in principle. A 5-foot mill requires about eight H. P., and crushes about twenty tons per day. Before starting up a certain amount of quicksilver, up to fifty lbs., is introduced into the pan with some water and rock. The supply should be regulated to make a stiffer pulp than in a stamp-battery; quicksilver is added from time to time. A groove in the bottom of the pan, connecting with a plug-hole on the outside, permits of the quicksilver and amalgam being drawn off at intervals to recover the latter, after which the former is returned. If the pan is working correctly the bottom around the center remains bare; this can be observed through the cover while running; when not bare, it is a sign that the pan is being overfed. As the machine throws the pulp with considerable violence through the curved screens, a shield is placed outside of them, directing the pulp into a narrow sluiceway with a spout opening on the apron-plate. It is claimed that the percentage of gold amalgamated and saved on the inside is far grater than in the stamp-mortar, going above 80%; all rusty gold being subjected to a heavy scouring action. The Russian-iron screens used are short-lived; they can be made to last somewhat longer by placing a false screen, made from an old worn screen with the openings enlarged, between the pulp and the screen proper.

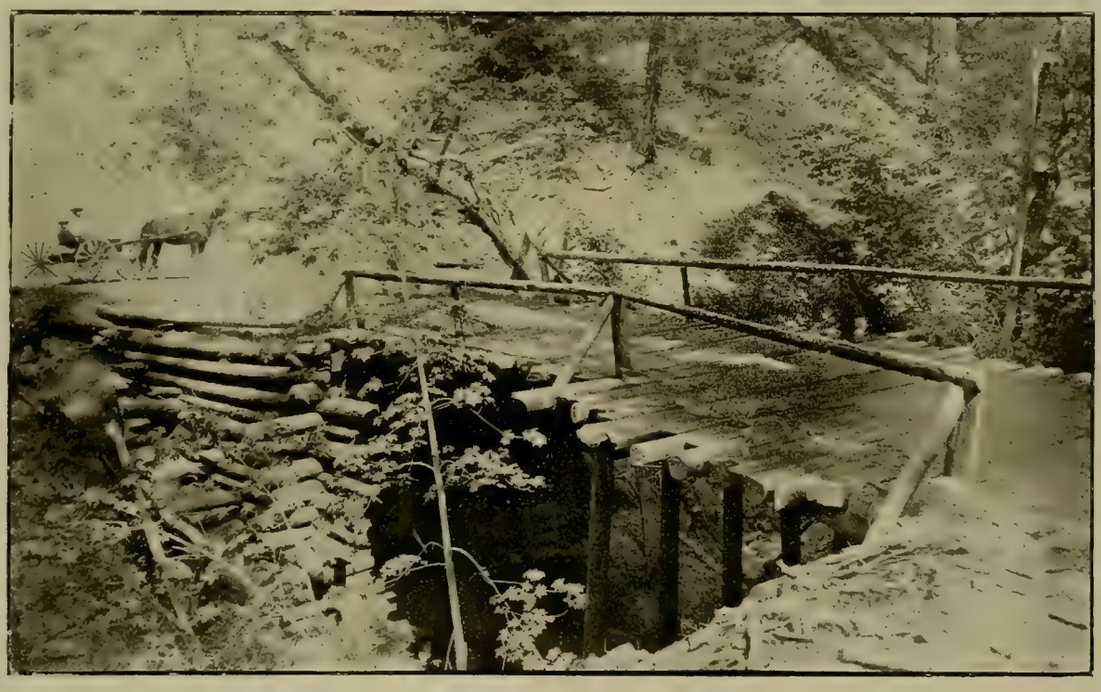
Great care must be exercised in putting up one of these machines, to get it perfectly level and on a rigid foundation, and to keep all the bolts holding the pan on the foundiation well tightened up; the feed also requires close observation.

When cleaning up or renewing the ring-dies or shoes, the top cover, with the suspended rollers, are lifted out with chain block and tackle, leaving the interior of the pan free for operation.

The mill works well on soft quartz and clayey ores, introduced in pieces not larger than walnuts. A great drawback to the machine is that the rings on the rollers and also the dies become "unround" so that instead of rolling smoothly, they strike in places, necessitating changing the rings before they are worn out; this changing takes up some time.

The opinions of millmen who have handled the Huntington mill, as to its merits, are very diverse. Where the ore produces a large amount of fine stuff, by using a grizzly with closely set bars, the Huntington can be run to advantage on these "smalls" in conjunction with the stamps.

*The Bryan Roller Mill* is a modified form of the Chili mill, built in sizes of 4 feet and 5 feet diameter. It consists of an annular mortar with an outside gutter and spout, cast solid, containing steel dies arranged in the track of three crushing rollers, which in the 5-foot mill have a crushing face of 7 inches, a diameter of 44 inches, and weigh 3,650 lbs. They have fixed axles, "journaled" in a central revolving table, attached to and driven by a belt pulley. This pulley is a cylindrical tank, which, in the smaller pattern, rests immediately on the rollers, and can be made to increase their crushing power by being loaded. The mortar is supplied with curved screen-frames around the entire machine, the pulp being discharged all around into a gutter delivering through a spout, on one side, to an apron-plate.



The chief wearing parts are the steel dies and tires on the rollers, these latter are fastened to the rollers by wooden wedges. According to the statement of the manufacturers (Risdon Iron Works, San Francisco), one set of these wearing parts will crush from 4,000 to 8,000 tons of ore in the large size, and 1,500 to 2,000 tons in the smaller size, and at the rate of 25 to 35 tons and 12 to 20 tons per day, with a speed of 30 and 60 revolutions, respectively, per minute, the smaller size requiring from 5 to 6 H. P. The oil channels for lubricating the bearings are arranged to prevent the oil from entering the mortar. To keep the pulp from baking the rollers or dies, and to assist in equalizing the ore received from the feeder, scrapers with adjustable springs follow each roller. They are also provided with self-feeders. In operating the mill, ore, water, and mercury are introduced into the mortar, the pulp passing around next the screens in a current not less than 300 feet per minute, while the motion inside of the rollers is much slower. The amalgam, working its way toward the center cone, is kept from being re-ground, and and can be observed while the mill is in operation; it is claimed to retain 80% of the amalgam in the mortar. To clean it up, the dies between the rollers are removed, the pulp and amalgam taken out, and wooden blocks of the thickness of the die put in their stead, on which the rollers are revolved, when the remaining ones can be taken up. It is claimed for these mills, that they wear smooth, and even while crushing hard quartz, discharge freely (on account of large screen area), avoid sliming and flouring of quicksilver, are good amalgamators, can be cleaned rapidly, are easily put in place, and require small power for amount of work done.

*The Griffin Mill* belongs to that class of mills using a roll running against a ring or die; but instead of several rollers, as in the Huntington, this has one roller only, swinging from a longer shaft, hung from a point in the central axis of the mill, and rotated about its own axis by the power applied at the top. It is run at a speed of 190 to 200 revolutions per minute, crushing from 1½ to 2½ tons per hour, the power being applied to a horizontal pulley above, from which the shaft is suspended with a universal joint, and the roller is rigidly attached to the lower extremity of the shaft. The roller swings in a circular pan supplied with a ring or die against which the roller works; and carries on the under side scrapers or plows to prevent the pulp from baking. A circular screen-frame is fastened on the pan, to the top of which a conical shield is attached at the apex, through which the shaft works. The pulley revolves upon a tapered and adjustable bearing, supported by the frame composed of iron standards, two of which are extended above the pulley to carry the arms in which is secured the hollow journal-pin. The shaft is suspended to a universal joint within the pulley. This joint is composed of the ball or sphere with trunnions attached thereto, which work in half boxes that slide up and down recesses in the pulley-head casting. The lubricant is supplied, for all parts needing it, through the hollow pin. The roll revolves within the ring-die in the same direction that the shaft is driven, but on coming in contact with the die, it travels around the die in the opposite direction from that in which the roll is revolving with the shaft. A pressure, by centrifugal force, of 6,000 lbs. is brought to bear on the material being pulverized between the roll and die. The water is introduced with feed when running, and receives a whirling motion from the roll, which brings the pulp against the screens 9 feet in area. A circular trough on the outside of the pan conducts the pulp to one side, where it discharges over an apron.

## A Rustic Bridge.

The bridge structure illustrated herewith is chiefly commendable on the ground of picturesqueness. It has not the durability nor the strength of a well-framed bridge resting upon good abutments, and yet such bridges have served a most excellent purpose and will long continue to do so. They are readily built of material which is just at hand, and their cost is very small. If well located and the underpinning shielded from erosion they may endure for a long time, for logs of coast timber are long-lived. But such bridges are only tolerable on side roads of limited travel. In the natural improvement of our highways such bridges must give way to less picturesque but stronger and safer structures of frame or iron, which do not rest upon midstream posts, but will span the torrent successfully, no matter how swollen or angry the winter storms may make it. In spite of this progress and development, however, those who enjoy the picturesque will probably always be able to find such bridges to exercise their pencils or cameras upon. The form will survive because it is fitting to conditions which will always prevail in retired regions, whose natural beauty is their chief resource.

A PICTURESQUE RUSTIC BRIDGE IN THE FOOTHILLS OF CALIFORNIA.

## Milling in Miniature.

A curio has been presented to the State Mining Bureau which will possess great interest for all who are curious about gold mines. It is a miniature of the ten-stamp quartz mill at the Rising Sun mine in Placer county. Though the scale is only an inch to the foot, every detail has been introduced, so that the mill will possess considerable educational value.

The hoisting works, engine-rooms, stamp mill, concentrators, carpenter shop and blacksmith shop are all in their proper places. Cars, men and the various tools and appliances are put in so that the observer can follow every step in the extracting of the gold from the quartz.

The model is a little over twelve feet in length, the original being 145 feet long. It was made by N. J. Young, the builder of the mill. It became the property of J. Z. Davis, who has presented it to the Mining Bureau.—S. F. Call.

THE following table shows the number of barrels (of forty-two gallons each) of petroleum produced in the United States in 1893 and 1894:

| *Fields.* | *1893.* | *1894.* |
|---|---|---|
| Appalachian | 31,365,890 | 30,783,424 |
| Lima-Indiana | 15,982,097 | 17,296,510 |
| Florence, Colorado | 594,390 | 515,746 |
| Southern California | 466,179 | 705,969 |
| Kansas | ..... | 40,000 |
| Wyoming | ..... | 2,369 |
| Other | 4,110 | 498 |
| Totals | 48,412,666 | 49,344,516 |

PHOTOGRAPHS have recently been taken automatically on kites 3000 feet high.

## Calaveras Co. Mother Lode Region.

For some time a correct and authentic up-to-date map of the Calaveras County Mother Lode Region has been requested, and in compliance with that desire is herewith presented a map engraved in this office last week from the best procurable data.

Following are the names and designation of the mining properties referred to by numbers on the map. The map is drawn on a scale of one-half inch to one mile:

T. 5 N., R. 11 E.

| No. | Sec. | Name of Mine. |
|---|---|---|
| 1 | 26 | McNevin and millsite |
| 2 | 26 | North Extension Quaker City |
| 3 | 14-15 | Finck Gold |
| 4 | 10-15 | Hancock & Tibbitts |
| 5 | 15 | Barattini |
| 6 | 15 | Oneto |
| 7 | 15-22 | White Swan |
| 8 | 22 | Flour Sack |
| 9 | 21-22 | North Paloma |
| 0 | 21-22-27-28 | Gwin |
| 1 | 27-28 | South Extension Gwin No. 1 |

## The World's Greatest Gold Field.

Written by DAN DE QUILLE.

Now that the attention of the majority of the miners and prospectors of the Pacific Coast States is specially directed to the search for and development of veins of gold-bearing quartz, we may very safely predict as the result the discovery and development of thousands and tens of thousands of mines on veins now unknown and in regions at present unexplored. While the majority of the workable mines opened will be such as may be rated as moderately rich, a few wonderful discoveries will doubtless be made here and there in the different mining States. Even in California, the oldest of the coast mining States, there probably remains to be discovered a richer gold mine than any that has yet been found. Undoubtedly, immense deposits of gold are to-day lying hidden in nooks in the hills and mountains of California where their presence is little suspected. These may not be out in the wilds; they are as liable to be under the streets of the oldest of the mining towns as anywhere else.

The local papers of the Pacific coast show that new and valuable finds of gold are being made almost daily in some sections; therefore, in a few years the total number of gold-producing properties must be immense. The area of country in which the finding of paying gold mines is not only possible but also probable, is almost boundless, as all the region lying between the Rocky mountains and the Pacific ocean, and from Mexico to the extreme northern shores of Alaska, may be set down as gold producing. A gold mine that has proved a paying property, is now very seldom permanently abandoned as worked out; work may be suspended for a time, but it is always with the intention of resuming operations at some time in the future. In the early days of quartz mining in California not a few mines were permanently abandoned after working out a single surface deposit or ore chute, and some of these are now the best-paying gold properties in the State. To-day there is probably not to be found in all California a single mine on a vein of gold quartz which once paid a fair profit for working that can be set down as permanently abandoned; some one is holding on to all such mines, and sooner or later work is resumed on all, and with as good results as would be obtained in working new veins showing the same prospects.

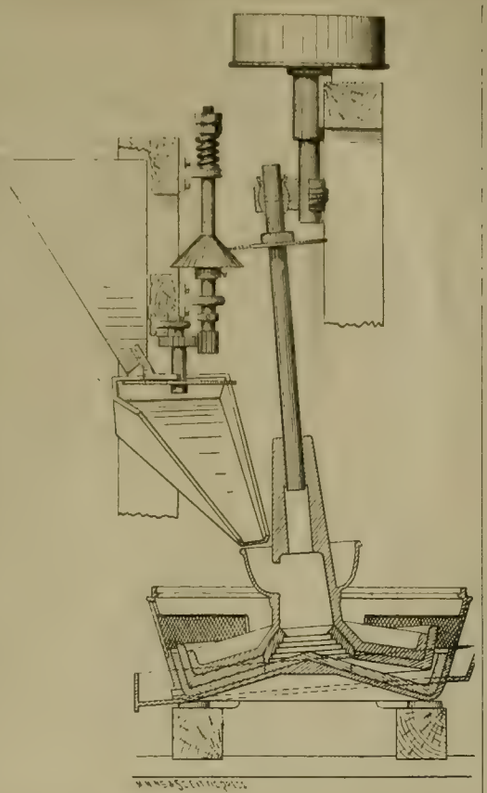
At Grass Valley and about Nevada City, where quartz mining first began in California, mines that were opened forty years ago are still paying richly, and at the depth of 2000 feet show no sign of exhaustion. It seems probable that the ore will continue to as great a depth as man is able, with all his inventions and ingenuity, to follow it. It is the same at the other old quartz mining camps in California. Not a mine or vein of gold quartz in California that once paid a fair profit can be set down as worked out. Some may say that this permanence may not be found in the gold-bearing veins of the mining States which lie to the east of the Sierra Nevada range, but actual work shows the same vitality in the mines of the eastern gold belts. In Nevada, where gold quartz mining began at Silver City thirty-five years ago, the mines are still being worked, and are now paying better than ever before. At Pine Grove and one or two other places are mines of gold quartz that have been worked for from twenty-five to thirty years, and they are still paying as well as at first. At all these places new and rich mines are still occasionally being discovered.

There are, of course, in all sections of the Pacific Coast States quartz veins that do not pay for working. Some of these are barren, while others show some metallic value. A man may have a claim on a vein and may do a large amount of work on it, but until he has developed a paying deposit of ore he has not a mine; he has only a prospect, and it may never be anything more. Once a claim is worked to a profit it takes its place in the list of mines, and only such properties are considered—or worthy of being considered—in an examination of our mines in regard to their permanence; we have nothing to do with prospect holes. Counting only the properties that have once been paying, we may consider the gold mines of the Pacific coast as permanent, as very few have been completely abandoned.

Once a mine, always a mine. What is to-day but a prospect hole may to-morrow be a mine. Our prospectors are constantly adding to the list of our mines, and in a few years they will be almost innumerable. Some of these will yield immense profits, a great number will be good paying properties, and they will then taper down in productiveness to such as merely pay fair wages for working. However, we can see that at the rate at which new veins are being discovered and new mines being developed the total yield of the Pacific coast gold regions will be immense. The thousands of little mines will count. Of course, the great yield of a big mine sounds well in a report and attracts great attention, but more gold may be produced by half a dozen small mines about which nothing is said. Another advantage to be derived from the workings of a great number of small mines will be the regularity of the total production. The best of mines are not always in "bonanza," for barren places are to be found in all veins, therefore

while some are out of luck for a time, others will be doing well. The small average run of mines will prove to be the regulators. These are nowhere to be despised; they are as good for the country as the biggest and richest gold mines.

As for the finding of additional paying gold mines, we as yet hardly know what we have got in the region of country we are prospecting. It is only within the past three or four years that miners and prospectors in the States east of the Sierras began a special and earnest search for gold, while in California they are but now awakening and resuming the work of prospecting their immensely rich gold fields, having done next to nothing in that line for several years. To day there are probably as many rich gold discoveries remaining to be made in California as in any region on the Pacific coast, and not up in the mountain wilds, but in the immediate vicinity of some of the oldest and richest mines in the State. The "mother lode" of California is not a single large quartz vein, as many suppose. It is an auriferous belt from twenty-five to thirty miles wide, and over one hundred miles long, in which are many veins of all sizes. It is a great system of parallel veins. Many of these crop out on the surface, but there are also many that do not reach the surface. After some further ages of erosion these latter would show up to the light of day, but at present they are hidden. I think that, without a sign of a vein on the surface, it would be a safe and sensible operation for a man of capital to put down a first-class prospecting shaft in the mineral belt near Grass Valley, Angels, Sonora, or any of the old and rich California camps, taking the chances of finding veins belonging to the system not yet brought to the surface by erosion. The great mineral belt is full of parallel veins and those that do not come to the surface are often as large and rich as those that crop out. There is no better place in which to prospect than immediately about the old and rich California camps. No doubt fifty years hence rich discoveries will still be made about these camps. No man can see into the rock in which he is at work the length of his pick handle, and until every foot of ground in a mineral belt has been cut across, there is always a chance of finding a paying deposit of ore. This being the situation in the oldest mining camps of the coast, the innumerable veins yet to be discovered in the great States lying to the eastward of the Sierra Nevada range may be imagined. In this region new and valuable discoveries are still being made in and about the camps in which are known and paying mines, while outside there are immense regions thus far unprospected and in places almost unexplored; indeed, there are in many places in this great American gold region immense sections that are absolutely unexplored. To exhaust the possibilities of the Pacific coast's gold region will require ages.



Taking all the Pacific coast States and Territories, the total number of mines being added to the list of paying producers each year is very great, and will continue to be great far into the next century. As the oldest of our gold mines—those opened twenty, thirty and forty years ago—are still being profitably worked, and as there is no reason why the paying mines now being developed should not prove equally permanent, it is evident that in five or ten years there will be in operation in the Pacific coast region an almost incalculable number of mines, great and small. In a few years the production of the yellow metal in the great Pacific coast gold field will far surpass that of South Africa, Australia, or any other gold region in the world.—Denver Mining Industry and Review.

---

THE following is a list of the values of foreign coins as proclaimed by the Secretary of the Treasury on January 1st for the quarter. These values are to be taken in ascertaining the dutiable gold value of all foreign merchandise exported to the United States on or after January 1st for the purpose of assessment of duties. Values given in cents. Austria-Hungary, gold, crown, 20.3; Belgium, gold and silver, franc, 19.3; Bolivia, silver, boliviano, 49.1; British Posessions, N. H., gold, dollar, 100; Central American States, silver, peso, 49.1; Chile, gold and silver, peso, 91.2; China, Shanghai, silver, tael, 72.5; Haikwan, (customs), silver, tael, 80.3; Tientsin, silver, tael, 76.9; Cheefoo, silver, tael, 75.9; Colombia, silver, peso, 49.1; Cuba, gold and silver, peso, 92.6; Denmark, gold, crown, 26.3; Ecuador, silver, sucre, 49.1; Egypt, gold, pound, 494.3; France, gold and silver, franc, 19.3; German Empire, gold, mark, 23.8; Great Britain, pound, sterling, 486.65; Greece, gold and silver, drachma, 19.3; India, silver, rupee, 23.3; Italy, gold and silver, lira, 19.3; Japan, yen, gold, 99.7; silver, 52.9; Mexico, silver, dollar, 53.3; Netherlands, gold and silver, florin, 40.2; Norway, crown, 26.8; Peru, silver, sol, 49.1; Spain, gold and silver, peseta, 19.3; Sweden, gold, crown, 26.8; Venezuela, gold and silver, bolivar, 19.3; Switzerland, gold and silver, franc, 19.3.

---

IN the United States 3600 persons lost their lives by railroad accidents last year, and 2610 were seriously injured. The fatalities from fires were 1850, explosions 950, falling buildings 730, mines 730, cyclones and storms 410, and lightning 300.

## Mines and Mining in Nevada County, Grass Valley District.

NUMBER II.

Written by SAMUEL BUTLER.

Great activity has prevailed in mining in Grass Valley during the past year. This has been noticed more in the extensive preparations for the rehabilitation of abandoned mines that are known to be valuable than in the mines already producing gold. Arrangements have been perfected whereby the gold output of this town will be greatly increased. Internal and external conditions point to this conclusion. The town itself has improved greatly in appearance in recent years, over $135,000 having been expended in real estate and building improvements in the past twelve months, and it now claims a population of 8000 people, which places it in the first rank of interior cities.

In the past two or three years the claims of Grass Valley have been presented to the public notice through the medium of the MINING AND SCIENTIFIC PRESS and the local journals in a manner which its rich and unequaled resources deserve, and the result has been the acquisition of influential capital from foreign sources that has accomplished much good. The advantages for judicious investment in the mines of this district have become recognized in every mining and capitalistic center in the world, which fact has brought the city to an era of prosperity which promises to be unprecedented in its history. The spirit of progress has seized the prominent citizens, and they are more indefatigable in their efforts to advance the legitimate interests of the town than they were heretofore.

During 1895 the greatest interest centered around the Massachusetts Hill group of mines. Preparations were made to develop these mines under one management on an elaborate scale. The group includes the North Star, Rocky Bar, Great Britain, Stockbridge, Massachusetts Hill and several smaller claims. The North Star has been one of the most productive and prosperous mines ever developed in Grass Valley. It has a depth on the incline of 2800 feet, and several miles of drifts have been excavated. Some years ago James D. Hague, a noted geologist and prominent mining engineer, assumed the presidency of the North Star Company. While administering the affairs of his company he became thoroughly conversant with the rich resources of the district adjacent to that mine. He perceived the great advantages and profits to be derived from the development of the veins existing there, by operating the properties conjointly and on an extensive scale, and commenced negotiations for the purchase of all the veins it was possible to secure. He succeeded, and the company which he represents has one of the richest and most extensive mining properties to be found in California. External improvements have been made; a Rix air compressor has been erected on the property by the Fulton Engineering and Shipbuilding Works of San Francisco. The compressor will supply the entire motor power for the immense machinery to be propelled, and is capable of developing 800-horse power. Water will be supplied to a Pelton water wheel, eighteen feet in diameter, through a steel pipe twenty inches in diameter and 8000 feet in length. The enterprise is something of an innovation in the manner of securing motor power, and its operation will be watched with interest by mining men throughout the world. The cost of the entire plant will exceed $150,000, which shows a spirit of enterprise worthy of emulation by other capitalists who are interested in this section. The success of the project is assured, for the mines which it comprises have, in the aggregate, produced several millions of dollars, and the depth to which the veins in the North Star, Omaha and other large mines have attained gives assurance to similar depth here. The mine, when fully developed, will be capable of employing from 200 to 300 men, and its productiveness will be a source of great revenue to the town and will greatly augment the output of gold.

Another abandoned property which has recently been resuscitated is the Bullion consolidated mines, which comprise the John Bright, Galena, Ione and Alaska claims. This property is being operated by a wealthy and influential company, and is under the supervision of George Mainhart, M. E., whose efficient management is synonomous with success. A substantial hoisting and pumping plant has been erected and the property is otherwise supplied with all the modern appliances which are capable of developing it to a depth of 2000 feet. It was formerly one of the great gold producers of the district, but was, like most other valuable properties of that regime, abandoned because of lack of capital, incompetent management and inefficient machinery. Mr. Mainhart is one of the best mining engineers of this county, and it is the belief of competent engineers that under his supervision the Bullion will eventually become one of the great gold producers of Grass Valley and thereby regain its former prestige.

The W. Y. O. D. mine has made marked progress during the past year. Internal and external improvements have been numerous and very substantial. The mine is equipped with complete milling, hoisting and pumping plants which are capable of developing it to a depth of 3000 feet. During 1895 ten stamps were added to the mill, which makes twenty stamps in all. The mill runs night and day on ore which is extracted in quantities large enough during the day to supply it the entire twenty-four hours. The mine is in a very prosperous condition, milling 1200 tons of ore per month, and will undoubtedly greatly increase its product during the present year.

The Pennsylvania mine, which is adjacent to the W. Y. O. D., is rapidly progressing. After some very persistent prospecting the company has discovered a vein which is two feet in width, rich in sulphurets and free gold. The owners are mostly Grass Valley business men and miners.

During the past year the Crown Point mine has exchanged hands, having been purchased by a French syndicate, and the new owners state that the mine will be developed in a manner commensurate with its value. The mill and machinery now on the mine will be superseded by new and modern appliances which will be capable of developing it to a great depth and putting it on a profitable basis, to which we respond, Amen.

The other mines in operation in this district—the Empire, Omaha Con., Maryland, Electric, Orleans, Granite Hill, Independence, Merrimac, Wisconsin, Norambagua and North Star are all in a prosperous condition and daily adding to the output of this district. The prospects in Grass Valley were never brighter, and the present outlook indicates a very prosperous year.

Nevada City, Jan. 13, 1896.

---

ACCORDING to *Industries and Iron* the Yarrow aluminum torpedo boat has had but a brief career. Although it is but a short time since the vessel was floated, the metal has corroded to such a degree that it can be penetrated with slight pressure. M. Moissau has found that this pressure is produced by the presence of a certain impurity in aluminum, each of three samples of aluminum examined by him containing a minute percentage of the metal sodium. This may be a discovery of the greatest importance in regard to the commercial development of aluminum, and one which at the same time amply accounts for the deteriorating effects of water upon this material.

---

AS NEARLY as can be ascertained, 275,000 lives were lost in 1895 by battle, railroad accidents and various other disasters in this and other countries. The loss of life at sea has been estimated at 4000, and on inland waters at 148. These losses in 1894 reached nearly 7000.

---

THE total amount donated to colleges and universities last year was $12,379,820, charities $5,745,670, churches $2,089,150, museums and art galleries $1,724,500, libraries $532,433, and other institutions $6,471,976.

---

LOSS OF LIFE by battle last year cannot be closely estimated, but it is believed that it reached 157,986—in Armenia, China, Africa, India, Cuba and South America—during the year.

# Scientific Progress.

### Reversal in Invention.

In line with the recent article of W. H. Smyth of this city, in an article entitled "Is the Inventive Faculty a Myth?," which has received considerable attention, Edward P. Thompson, in an article in the journal of the Franklin Institute, entitled "Reversal in Invention," comments on a topic of importance to inventors, viz., that a large number of important devices may be sorted out into pairs, one of each pair being what he calls a "reversal" of the other. Thus, the dynamo, which transforms mechanical into electric energy, on being reversed becomes the motor, which changes electric energy back again into the mechanical form. Had this principle of reversal been recognized long ago, each of these pairs of inventions would have required but a single inventive act, instead of two entirely independent ones. Both the invention and its reversal would have been devised at once, instead of by different persons going through different trains of thought at widely different periods. Following are a few of Mr. Thompson's illustrations of these "reversed" inventions:

"At the time the microscope was invented the principle of reversal could have been applied by reasoning that, if a distant large object could be made to appear nearer, could not a near object be made to appear larger? Had this idea been created, the mechanical execution could have been carried out by experiments with lenses of different convexities, concavities and numbers.

"A reversal of the telephone, which causes distant sounds to appear near, would be a microphone, but the present instrument is improperly named, as it does not enlarge, but simply creates a sound. When first invented its wonderful power was spoken of as making the walking of a fly sound like thunder, but this is false, because the fly jarred loose carbon electric contacts, thereby causing great fluctuations of current and violent action of the receiving telephone. * * * *

"The present air-brake system is now recognizable as a reversal of the early type, but a long time passed before the change took place. The principle had not been used as a kind of tool, and, therefore, the idea of the new brake did not come by demand of the mind, but by a combination of circumstances—that is to say, accidentally. The two systems of brake referred to are perhaps already conjectured by the reader, the first operating to stop a train by the positive action of compressed air agninst the wheels through the medium of the usual brake shoes, and the second by the negative action of compressed air, which normally holds the shoes away from the wheels in opposition to a spring. The advantages of the second way are apparent as soon as compared as to their main object, safety; for, by the former the train cannot be stopped in the case of a leak or a disordered pump, while with the latter the train stands still as soon as the air leaks out or the pumps refuse to work. * * * *

"The mental process of investigating this subject makes the principle so simple that it is a wonder that inventions existed so long before their opposite phases were thought of. Electricity furnishes several examples besides the dynamo-motor example, where the principle was not applied by a predetermined act. The old form of burglar alarm had an open circuit, and the process of opening the window closed the circuit and rang a bell. The reversal of this is a normally closed circuit. The opening of the window breaks the circuit and the bell rings. The idea once gained, and the advantages are apparent, for an alarm is given if the burglar cuts the wire. * * *

"The storage battery, although condemned for railway traction, is still one of the valuable inventions of the day, and is an exact reversal of the galvanic battery. The reversal is disclosed by stating that the operation of the primary or galvanic battery consisted in placing metal plates into a solution of salt or acid, and carrying off the electric current by a wire. The reverse of this consists in starting with an electric current, after the battery is partly exhausted, and passing the current through the solution in order to restore the chemicals to their original composition, ready to give off current as before the charging."

---

THE human skin in a condition of health may be inflamed by light of great intensity, and in smallpox the already inflamed skin seems to be as sensitive to the chemical rays as a photographic plate. This discovery has led to recent experiments in the exclusion of the actinic rays of sunlight from smallpox patients to prevent suppuration and pitting. From an account by Dr. N. R. Pinsen of Copenhagen, it appears that the treatment should be commenced as early as possible, that the chemical rays should be carefully shut out by window glass of a deep red color, or by very thick curtains, that the patient may safely use weak candle light when taking his meals, and that natural daylight must not be admitted until the vesicles have dried up. This treatment does not interfere with any other that may be considered necessary. In several cases of unvaccinated children suffering from smallpox one physician, at first skeptical as to the influence of the red light, was surprised at the favorable course of the disease, as the vesicles did not suppurate, there was no secondary fever, and no permanent pitting resulted.

---

A CORRESPONDENT of the *L'Etincelle Electrique* states that the telephone, on account of its marvelous sensitiveness, acts as a sort of barometer in the following manner: Two bars of iron, split and separated at their lower ends in order to increase their surface of contact, are placed in the earth at a distance of five or six yards from each other. Every week or two the earth at the faces of these bars is saturated with a solution of chlorhydrate of ammonium. Each of the bars is connected to a telephone in an adjoining house by a conducting wire. Twelve or fifteen hours before a storm a characteristic chirping sound is heard in the receiver, which increases as the storm approaches—a sound like hail on a metal roof. At each lightning flash a sound like a dull blow is heard. Previous to changes of temperature a sort of murmur is heard like the distant song of birds.

---

We may say, then, that the invention of a successful airship will cause an entire revolution in the art of war more stupendous than that caused by any invention since that of gunpowder, and even surpassing that, since it only increased the distance between the lines of the combatants, while the principles of attack and defense, strategy and supply, remained unchanged, or were only slowly modified. A flying machine, however, will nullify strategy, make vital changes in the principles of attack and defense, diminish the importance of navies and seacoast fortifications, and by bringing the theater of operations to the doors of palaces and legislatures, render speedy settlement of national grievances imperative.—From "The Influence of the Airship on War," by Lieut. J. K. Cree, U. S. A., in North American Review for January.

---

*Le Naturaliste* announces that a new mineral has been discovered at Allchar, in Macedonia, by Professor Krenner, who named it lorandite. It is found in short prismatic crystals, and more rarely in oblique rhomboidal prisms. Its color varies between cochineal and cardinal red, the crystals are transparent and flexible, like those of gypsum.

---

A BORE-HOLE near Port Jackson, New South Wales, has reached a depth of nearly 3000 feet. It shows an increase in the earth's temperature of one degree Fahrenheit in eighty feet, while the average in the northern hemisphere is one degree in sixty feet.

# Mechanical Progress.

### Doctor of Machinery.

Among the multitudinous trades and professions there are many which are entirely unknown, even by name, to the general public. One of the least known and most interesting is that of the expert in machinery. The work of a machinery specialist is far higher than that of a skilled engineer, and many years of experience and special training are necessary to fit the expert for his duties. A New York paper says there are only about half a dozen of these men in the country, one in every large city. When anything goes wrong with a machinery plant of whatever nature, the cause of which the engineer in charge, frequently the builder of the engines, cannot discover, the machinery doctor is called in. Every chief engineer of a big plant may be called a specialist, so far as the machinery under his charge is concerned, but the specialist in machinery is an expert in engines of every description.

Though he has never seen the engine before, he rapidly diagnoses the case and prescribes a remedy, just as a doctor does for a sick patient. The instrument most used by him is a dentophone, which consists of a thin steel rod about a foot long, which he holds between his teeth, and applies to the head of the cylinder. To the practiced ear of the expert every sound transmitted from the cylinder tells a story. The working of the piston in the cylinder, and, indeed, of the whole engine, can be heard distinctly in this manner by anybody, but it takes an expert to tell just what those sounds mean.

In the case of a mysterious knocking which was heard in the cylinder of the big driving engine in a large spinning factory not long ago, an expert was called in to determine the cause. Every method had been tried to discover where the trouble was, but without avail. Bearings were examined, the cylinder was taken apart, and every part well oiled, all to no purpose. When the expert came he traced the mysterious knocking from the cylinder, along the piston rod, crank shaft, and through the main shaft, away off among the looms, where one of the looms was found to be the cause of the trouble.

Often an expert's services are required in the case of synchronizing looms. If all the looms in a big spinning factory happen to beat together, as sometimes happens, the vibration is strong enough to bring the building down. For the same reason soldiers always break step when going over a suspension bridge, for otherwise the measured tramp of the many feet, all striking the ground at the same time, would seriously endanger the structure. The power of sound is also enormous when exerted in a particular way. Every substance in nature has a keynote, and when a sound of the same pitch is caused near it a considerable amount of vibration is produced. When the great tubular bridge was being built across the Menai Straits, which divide England from the island of Anglesea, a traveling violinist nearly caused the collapse of the whole structure. He happened, while playing, to hold for a considerable time a note which chanced to be the keynote of the huge bridge structure. The sound echoed along the vast tube and re-echoed with ever-increasing force until the whole bridge vibrated as if an earthquake were taking place. The bridge engineer, who was near by, instantly divined the cause, and stopped the playing of the violinist.

Part of the business of the machinery doctor consists in so arranging the distribution of looms and other machinery that their working will not endanger the stability of the factory. Defects in a boiler can also be instantly determined by the practiced ear of the specialist. A plate in the boiler is selected which is known to be in good condition, and he takes mental note of the pitch of the sound made when the plate is struck with a hammer. All the other plates are struck in the same way, and any one which does not ring true and conform to the correct pitch is examined and replaced. A case is on record where a machinery specialist was crossing the ocean and detected crystallization in the center of the shaft, thereby averting what might have been a serious accident in mid-ocean. Measures were taken to strengthen the shaft in the place where the quick ear of the expert detected weakness, and when the vessel was docked his suspicions proved correct.

Few men, even with the most exhaustive training, can become experts at this business, as it requires a marvelous quickness of ear and delicate perception of sound with which few men are blessed. Technical knowledge is of little avail in itself, and a fine engineer might be a poor machinery doctor, just as a great musician might make an indifferent piano tuner. Whenever a big mill is erected, a specialist is always consulted as to the placing of the machinery, and his fee is generally well worth the expense and trouble which an injudicious distribution of machines may cause.

---

### A New Blasting Method.

During last year blasting tests have been made in several mines of Austria-Hungary according to a charging and firing method invented by the mining counsellor, L. Jaroljmek, which tests are said to have furnished very good results. While so far blasting was connected with the greatest dangers, as for firing the charge by means of fuses or electricity external manipulations producing fire and sparks were required as impulse for the explosion of the charge, Jaroljmek locates the igniting impulse in the interior of the hole. The priming is based upon a chemical reaction, which is produced within the hole by water introduced into a body of caustic lime, which is arranged above the charge. The heat developed by the slacking of the lime is allowed to act from the outside upon a peculiarly constructed cap, which by its detonation explodes the charge within a certain time. By a timing arrangement the operator is enabled to fix the time of the explosion. This arrangement is very simple. The body of lime is covered more or less by a sheet of tin foil. Thus the access of the water is limited to a larger or smaller surface of the lime body, whereby on account of the heat being developed quicker or slower the charge is exploded correspondingly sooner or later. The tests proved the method to be practicable even under the most unfavorable conditions. The difficulty to conduct water to vertical holes is removed by laying wet moss or peat upon the cap. The water used for the charge furnishes in connection with the lime, which inflates very strongly by hydration, a stopping up of the hole, which is extremely effective against the blasting gases. Hereby a fiery blowout of the shot, which used to be so dangerous, is automatically made impossible. As this method further forces the operator to surround the blasting material with water, the developed gases are cooled off below the inflaming temperature of firedamp by their intimate contact with water, and because they lose heat while co-operating in the sprayification of the water. This was the case even when a certain kind of dynamite was used, which otherwise always ignited the firedamp, and for shots highly overcharged, too. In fact, the blasting gases are made entirely harmless, which is of great importance for the indispensable blasting in mines containing methyle ($C^2H^3$) and coal dust.—Organ der Bohrtechniker.

---

A TERRESTRIAL GLOBE on a scale of 1 to 100,000 has been projected by M. Elisee Reclus, the French geographer, who believes that such a work would promote geographical discovery and topographic knowledge. The globe would be about 400 feet in diameter, and mountains a mile high would appear as elevations of about half an inch.

# Electrical Progress.

### Electrical Reduction of Colorado Ores.

W. S. Stratton of the Independence mine, Colorado, has contracted for the equipment of a complete electrical reduction plant to be installed at one of his extensive ore mines either at Cripple Creek or Colorado City. The equipment will consist of a direct connected generator having a capacity of 2,000 amperes at twenty-five volts. The ore will first be crushed, then placed in vats to be acted upon electrolytically; the process being similar to that employed at the Anaconada mine. In this plant there are seven generators. Four give a current of 1,200 amperes at a pressure of sixty volts and three give 750 amperes at 140 volts. The tanks each contain 100 plates placed in series. The tanks are connected up in sets of five, and these sets are connected with the feed wires in multiple. The original plates are cast in the shape of a very broad T, the two flanges at the top being the supporting points and the bottom going into the tank. The solution in this tank is made up of copper, gold and silver, mainly copper. While running, the solution is kept up to almost saturation. The action of the plates is for the solution to dissolve copper off the first plate and deposit the same amount on the bottom of the second, and at the same time dissolve off a portion of the face of the second and deposit this on the rear of the third, and so on. The first plate, instead of being copper, is lead and does not contribute to the solution. The backs of all the other plates are blackleaded, so that the copper may strip when wanted. By keeping the copper solution up to its highest point in value, as is readily determined by the use of a hydrometer with frequent assays as a check, the copper dissolves off the face of the plates only in very small proportions, while the amount deposited on the rear is extremely great.

When the solutions are first made up, says *Electricity*, all the metals present are dissolved, and, if they were all deposited on the plate there would be no advantage. As nearly all metals require a slightly different current for plating or depositing, the current is so regulated that the copper only is deposited and the gold and silver are dropped to the bottom of the vat as slime, which is cleaned out frequently and refined. At the same time the solutions themselves grow saturated with these metals, and they are also at long intervals taken out and the contents precipitated and recovered. By the electrolytis process copper of more than 99 per cent fine can be produced.

---

A RECENT DECISION in one of the Federal courts has awarded the priority of invention to a naturalized Belgian, who died some years ago, in regard to the little underrunning wheel which makes contact at the end of the long pole with the wire which brings the current from the power house to the cars on the road. Street railway practice has settled down to the use of this device all over the United States, but as a matter of fact many other devices have been tried, and some are in regular use, especially in Europe. In America an early form was a real little "trolley"—hence the present misnomer—which ran along on top of the wire, but was always tumbling off and hitting the roof of the car with a noise like thunder. The scared passengers often thought it was an explosion of electricity, and the car crew often lost their patience putting the device back on the wire with the aid of forked sticks carried for that special purpose. Another method tried in this country with fair success was to run a sort of metal shoe along in sliding contact with the wires. In Europe for many years a split tube sliding over and around the wire has been used with excellent results, but the most popular form is a trolley pole with a cap of bent wire, making it look like an exaggerated letter T; and this is sometimes modified into a triangular shape of wire, supported from the car roof. Both these scrape along under the wire and their width gives them plenty of play. In this country one of the very latest forms has a trolley wheel pressing against the side of the wire, just as though the top of the ordinary trolley pole had been bent over.

---

THE works of the Pittsburg Reduction Co. have now been in operation at Niagara Falls for several months. The necessary electric current has hitherto been furnished through four of the General Electric Co.'s 400 K. W. rotary converters, but owing to a considerable increase in the reduction plant they have been found inadequate for the service, and each of these 400 K. W. converters is about to be replaced by one of 600 K. W. capacity. The new machines will be mounted upon the same base frames as the 400 K. W. converters, and thus the converter plant will be increased one-half without any increase in floor space. A fifth converter of 600 K. W. capacity will be installed beside the others and will be similar to them in very respect. The total rotary converter capacity will then be 3000 K. W. Including the transformers installed in the works of the Carborundum Co. and the Calcium Carbide Co. at Niagara Falls, the General Electric Co. will have furnished 5000 K. W. capacity of transformers for operation in connection with the Cataract Construction Co.'s system.

---

THE latest in the way of electrical progress is announced by Julius Emmner of Washington City, who says that he has invented a machine which will record a man's thoughts. He states that this machine "receives the magnetic thought waves which stream from the physical brain of the operator, and portrays them with microscopic fidelity, in an imperishable message," which causes the *American Manufacturer* to reflect that the record of some men's thoughts thus shown up would be a sight fearful to look upon.

---

THE Westinghouse Electric and Manufacturing Company, which was organized in 1886, has installed upwards up 600 lighting plants in various parts of the world, representing over 2,000,000 sixteen-candle power incandescent lights. This company also manufactures motors and generators, as well as apparatus for the electric transmission of power by the Tesla polyphase system. The capital of the company is $10,000,000; the number of persons employed 4000, and the product in 1895 over $6,000,000.

---

THE second direct coupled 800 K. W. monocyclic generator built by the General Electric Co. has been started successfully in the St. Louis station. This machine and its brother, which has been operating for some time in that station, are the largest generators in the world, so large, indeed, that it was impossible to assemble them at the works before shipment. They are now operating successfully incandescent lamps, arc lights and motors in the city of St. Louis.

---

OFFICIALS of the New York, New Haven and Hartford road are examining some new electric motors designed for heavy service, which are the joint product of the Baldwin Locomotive Works and the Westinghouse Electric and Manufacturing Company. This road is reported as having in contemplation the equipment of several of its branches for electric service in addition to those already in operation.

---

IT is the duty of a trade paper to do all it can for the best interests of the industry it claims to represent, and to foster its honest, stable and sound development; and it is equally the duty of every writer on the subject connected with the technical press of this industry to do likewise. Statements in the columns of the electrical journals of this country, tending to "boom" the industry on unsound lines, are sure to eventually injure the industry; and flowery and fanciful articles in the daily papers, written by persons connected with such journals, and tending to mislead the public concerning the possibilities of utilizing electrical energy, without reference to the commercial or practical results, are to be deprecated and looked upon as a direct and positive injury to the industry.—Electricity.

---

A PATENT has just been granted to George Westinghouse, Jr., for the construction of ventilating armatures for dynamos. The armature discs are formed with lips or projections stamped up so as to stand at right angles to the main body of the disc. Any desired number of the lips may be made, and in making the armatures the discs will be inserted with sufficient frequency to obtain satisfactory ventilation, and the screwing up of the armatures will hold them firmly in place.

# Practical Information.

### To Protect Forests from Fires.

Representative Shafroth has introduced a novel bill, which has gone to the House Committee on Public Lands. It is designed to protect forests on the public domain from destruction by fire. It authorizes and directs the Secretary of the Interior to lay out ways 1000 feet in width through such forests on public lands as are liable to destruction by fire, putting them at "intervals of from five to ten miles apart," so that when cleared they may be effective for preventing the spreading of fires. The timber on these roads or ways is to be offered for sale at public auction, on the condition that each purchaser is to clear that part of the way of which the timber is bought by him. As to those parts which cannot be so cleared, bids are to be called for for clearing them. The purchaser or contractor, as the case may be, is to give a bond for the faithful execution of his work. Apparently, it is thought that a good deal of it must be done by contract, as the sum of $500,000 is appropriated by the act.

It is provided that anybody who willfully sets fire or causes setting fire to any timber upon the public domain, or who negligently leaves a fire burning unattended near any such timber, shall, upon conviction, be fined not less than $50 nor more than $5000, or be imprisoned not less than six months nor more than two years, or shall be both imprisoned and fined, as thus provided. Any person who builds a campfire or other fire near timber upon the public domain, and fails to extinguish it before leaving the place, is to be punished by a fine of not less than $25 nor more than $1000, or imprisonment for not less than thirty days nor more than a year, or by both.

It is provided that the Secretary of War shall, at the request of the Interior Department, detail soldiers to patrol the forests, and that they shall have power to make arrests under this act. The Secretary of the Interior is authorized to make other provisions for protection also against fire.

---

SOME ancient highways of the Mexican State of Michoacan, according to Baron von Brackel, appear to center toward the Bay of Maruata, on the Pacific coast, and may have been used in the transportation of copper and other minerals from the vicinity of Coalcoman. The roads are straight, six or seven feet wide, and paved with large unhewn stones. Many of the stones have been removed for modern buildings, but enough remain to make it possible to trace out and map the entire system.

---

THE explanation of Lord Kelvin's estimate that the "set-back" of the earth in its daily rotation round its axis amounts to twenty-two seconds per century, is reported to be that such retardation is owing to the friction caused by the tides, the latter acting as a brake, and such action is calculated, according to the same authority, to be equal in weight to some 400,000 tons applied on the equator. Other causes, he says, have also to be taken into account, as, for example, the increase in the size of the earth, due to the falling on it of meteoric dust, which, if deposited at the rate of one foot in 4,000 years, would produce the observed retardation by itself. Further, such a phenomenon as the annual growth and melting of snow and ice at the poles, by abstracting water from the other parts of the ocean, introduces irregularities into the problem, the abstraction accelerating the earth's motion, the melting, by restoring the water, retarding it.

### Magnifying Power.

Few persons have a clear notion of the magnifying powers that have been or can be obtained by means of the microscope. The following will be found trustworthy: A common hand magnifier, one-inch focus, magnifies ten times; very strong glasses, twenty times; small globule lenses, such as were sold for twenty-five cents, about fifty to seventy-five times; the most powerful single lenses that can be generally used, 150 times; the most powerful single lenses ever found available, 300 times; ordinary compound microscopes, highest power, from 250 to 500 times; highest power ordinarily obtained with the best microscopes, 1,500 times; highest power yet obtained, giving fair light and definition, 15,000 to 20,000 times. Claims have been made for much higher powers, but such claims are generally ignored by the best microscopists. By times, we mean in all cases, diameters. Sidewalk opticians generally mean areas when they speak of times. Areas are found by multiplying the diameters by themselves. Ten times, mentioned above, is 100 areas. The cheap microscopes, said to magnify 1,000 times, magnify about 33 diameters.

---

MR. JOSEPH D. WEEKS reports that the production of manganese ores proper in the United States in 1894 shows a reduction from the previous year, the product being 5308 tons in 1894, as compared with 7718 tons in 1893. The production of 1894 is the smallest of any year since 1884. The production of Arkansas in 1894 was about the same as in 1893; California shows a reduction of 122 tons, Virginia a reduction of about 2300 tons, while Georgia shows an increase of 553 tons, Tennessee an increase of 440 tons, and West Virginia, which does not appear at all in previous years, shows a production of 100 tons. The total value of the 6308 tons produced in 1894 was $53,635, or $8.50 a ton, as compared with a total value in 1893 of $66,614 and an average value of $8.63.

---

A NOVEL use of magnetism is reported from a foundry at Sandycroft, England, where electric cranes are operated from the electric power and lighting circuits, together with electromagnets, which permit the ready lifting of pieces of iron or steel weighing up to two tons. The magnets constructed for lifting purposes are attached to a crane. One magnet takes five and one-half amperes at 110 volts to excite it, at which energy it will support a weight of two tons of iron or steel. A switch controls the supply current delivered to the magnet. By the use of this magnet or crane three men do the work in one-quarter of an hour which previously took six men one hour and a half to perform.

---

GEORGE B. SPRIGGS of Baltimore, recently, in the presence of several physicians, pushed a car loaded with pig iron, weighing 65,000 pounds, twenty-five feet up grade. Spriggs is a blacksmith, who doesn't seem to know his own strength. He is twenty-five years of age and weighs 172 pounds. He is a mass of muscle. Eight men, aggregating 1500 pounds in weight, made an attempt to move the car, but failed. After the exhibition Spriggs was examined by the physicians. He has a chest expansion of forty-four inches and can lift 750 pounds on his fingers.

# Mining Summary.

## CALIFORNIA.

### Amador.

THE SULPHURETS PLANT. — *Republican:* Messrs. J. W. Dwyer and L. C. Gillian, from Washington State, have nearly completed their sulphurets saving plant below the Zeila mill. It is by far the most elaborate plant of the kind in the county, although it perhaps covers a somewhat less area than the Gates plant at the Kennedy. The building is built exclusively of galvanized iron, and is 160 feet long by about 70 feet wide. Four rows of blankets running the entire length of the building will be arranged for the pulp to run over and deposit the gold-bearing mineral. By machinery the tailings will be elevated at least ten feet, to flow over this series of devices for extracting the sulphurets. Altogether the plant will cost fully $3000. The owners, however, evidently know what they are doing. The precious metal is in the tailings flowing to waste from the mill, and they are confident of their ability to extract a sufficient percentage to make the investment a profitable one. They expect to start the plant early next month.

WORKING SULPHURETS.—The cost of treating sulphurets is a matter of vital importance to the mining industry of this county. The future of gold mining depends largely upon improved methods of saving a larger percentage of the gold-bearing sulphurets from the rock, and also upon the maximum extraction of the precious metal from the sulphurets at the minimum cost. Every step in either of these directions is a permanent benefit to the business of mining. Many a mine, abandoned in early days as unprofitable, would be working to-day had the present facilities of saving and treating sulphurets been known in those days. The difference in the yield would have sufficed to turn the scale, and make the venture a paying one. For many years the sulphurets produced here have been reduced within the county, at a cost—where the mine has no chlorination plant of its own—of from $15 to $20 per ton, and a saving of ninety per cent of the assay value. Latterly keen competition has arisen in the smelting business, inducing some of our mine owners to see what could be done in shipping their concentrates beyond the county. The Bay State Company sent sulphurets to a smelter in the State of Washington, and actually saved money thereby. The Selby Smelting Works at Vallejo Junction has made a reduction. The Wildman and the South Eureka companies have sent ores there, where they were treated at $14 and $15 a ton, the Selby Works paying the cost of transportation from Ione. This is a saving of fully $5 a ton, and amounts to considerable in the course of a year, where the output of a forty-stamp mill averages from two to three tons per day. One reason why ores can be worked to better advantage at the smelter is that they are able to save other metals besides gold, whereas the chlorine process depends entirely upon the gold. Whether our local reduction works can successfully compete with the reduced rates remains to be seen. In any event, however, the outcome cannot prove otherwise than a decided advantage to the leading industry of Amador county.

THE WILDMAN-MAHONEY.—*Record:* At the Wildman-Mahoney mine they have had a large force engaged for some time in laying new pipes and changing and rearranging old pipe. Some 2200 feet of new pipe has been placed in position and 400 feet of the old pipe changed. Both mills are now connected with the same pipe and each hoist is now operated with power from its own pipe. This new arrangement makes the mills and hoisting works separate, and in the future an accident to one will not cause a cessation of work on the other. Twenty more stamps will be put in operation about the first of next month.

GENERAL NOTES.

ARGONAUT.—*Republican:* The shaft is down 1050 feet. Assessment No. 1 on the entire capital stock was levied this week. This means that the $100,000 realized for a working capital by the sale of a portion of the stock has been exhausted. While the sinking has been very expensive owing to the adamantine nature of the rock passed through, still it is right to say that $20,000 has been expended in the purchase of real estate adjoining the mine, namely, the Leonard property, the Volunteer mine and the reservoir site, etc. Also a large sum has been spent in the purchase of machinery and erection of the buildings. Sinking will be continued until 1300 feet is reached, when drifts will be run to the line, where, it is alleged, the Kennedy has trespassed upon the Argonaut ground.

ONEIDA.—The Oneida has started up. Ross Brown has located the point for a new shaft about 500 feet east of the old works. The shaft is already down six or seven feet. A steam boiler and engine are expected from the city shortly. The shaft is to be put down as rapidly as possible to a depth of 1700 feet. The reopening of this property is believed to mark the commencement of a long career of activity. There is an immense quantity of low-grade rock, which it is believed with modern appliances and close management can be worked at a profit, although looked upon as worthless twenty years ago.

SOUTH EUREKA.—The mill of this mine has been in operation for three months. In November 800 tons were crushed, averaging $6 per ton; December, 900 tons, $10 per ton; January, 900 tons, $5 per ton. The result, even of the minimum yield, is more than sufficient to pay expenses, and insures the steady working of the property. The above figures include sulphurets.

ALPINE.—The Bank of California, the owner of this Plymouth mine, has given a London company an option for thirty days, the terms being that the company, on spending $50,000 in development work, is to have a one-half interest in the property. It is thought the English capitalists will take up the proposition.

KENNEDY.—The Kennedy mine keeps up its reputation as away in the lead among the gold producers of the county. We have it on good authority that the November cleanup amounted to $75,000, out of which a dividend of fifty cents per share was declared. In December the output was $54,000, and the dividend thirty cents per share. The new ore body on the east is yielding the bulk of the precious metal.

Several teams are engaged in hauling the old ten-stamp mill of the Hardenburg near Middle Bar to the Mechanics mine, near Sutter Creek. Everything is to be moved—both old timbers and ironwork.

At the Gover mine the shaft is free from water. The shaft itself, however, was in a very bad shape, necessitating the expenditure of a large amount of money in putting it in working condition. The mill is about ready to start.

At the Hazard claim on Rancheria creek the shaft is down 300 feet. The water is troublesome, and militates considerably with the sinking operations.

GWIN MINE.—In running west from the 1000 ft. level a vein of quartz was cut of a fine quality. The south drift has been run a distance of 150 ft. on the east side of the ledge, tapping it in two places, showing an increased thickness going south. The mine is now employing about thirty men. Mr. F. F. Thomas, Supt., has recovered from his late illness.

At the South Poloma, the shaft is nearing the 100-foot level from the tunnel; from this level drifts will be run 100 ft., north and south. The ore from the shaft is of a ribbon character, showing a large percentage of sulphurets.

### Butte.

At Forbestown the ledge in the lower tunnel of the Gold Bank mine which was begun a year ago and is in 1200 feet has cost about $12,000 and taps the ledge at a depth of 2400 feet. It is locally stated that a hundred-stamp mill will be erected in the spring at the mouth of the tunnel.

### Calaveras.

AROUND MURPHYS. — Corr. *Citizen:* The Falcon mine closed down its mill on Monday, as all available ore had been extracted—from the old levels up to the surface. Sinking is now an absolute necessity, and a force will commence this work at once.

The Gum Boot mine, on Indian creek, is reported to have been bonded during the past week. J. Willard is the representative of the company bonding.

The report that the McQuig mine has been sold has gained currency, and it is undoubtedly the fact that the property has changed hands and that the coin was put up.

The confirmation of the sale of the Rose Rock mine has given new encouragement. The deed, which was placed in escrow with Wells, Fargo & Co., at St. Louis, was taken and the price paid. The money arrived in Murphys a few days ago and all has been definitely settled as to the fact of the sale. Operations are proceeding considerately under charge of J. Heinsdorf.

*Chronicle:* Work at the Peek Ranch hydraulic has been suspended; but the tunnel, which is being driven into French Hill for the purpose of tapping the numerous quartz ledges that were uncovered by the surface washing, is being pushed steadily ahead. The rock encountered in the tunnel is extremely hard.

*Dispatch:* The old Hardenburg ten-stamp mill has been taken down and removed to a mine near the town of Sutter Creek, there to be put up on another quartz claim. Everything is gone from this old mine near Middle Bar that Hayward & Lane have been running for the past four to six years.

*Citizen:* All the machinery for the Donnallan mine is now in position and ready to start. The track is being built and will no doubt be completed by Monday. Mr. Hackett says there is now nothing more to do about the grounds except to start the work of development, and this will commence about the middle of next week.

### El Dorado.

(Special Correspondence).—The Bacquette Company of Los Angeles has bonded from D. H. Burlingham and is rapidly pushing development work in the reopening of an abandoned claim, in the neighborhood of the Idlewild.

The Idlewild, commonly known as the Taylor mine, has been run continuously for seven years with the single exception of one day in all these years.

The Melton & Witmer new ten-stamp mill near Grizzly Flat is crushing out medium class ore at a profit to its owners.

St. Louis people have bonded property near Kelsey four miles north of Placerville, and will begin development work at once.

San Francisco people, principal among whom is Mr. Palmer, have begun operations on the south extension of the Big Sandy, which after years of idleness is being taken up by its Toledo owners to be sunk to greater depth. The Kelsey neighborhood is rapidly gaining ground as a good field for deep mining.

The Lady Emma has struck a rich vein of six-foot ore, high grade, at a depth of 275 feet, and is now constructing a ten-stamp mill.

The demand for mining properties in this county is growing quite apace. Purchases are being made and bonds extended in various sections to a gratifying extent, and within the next six months, judging from present indications, El Dorado county will be quite alive in the mining field. Hotels and liveries are beginning to show the influx of mining men. Ranchers are preparing to give way to hammer and drill, and prospects are fair that hoisting works and mills will, ere another year has passed, tower far above the windmill and tank, and the noise of blast and stamp mill supersede the crowing of barnyard fowl and the lowing of cattle on the hillsides in many a section.

### Nevada.

ELECTRIC LIGHT AT THE W. Y. O. D.—*Tidings:* An electric light plant has been put in at the W. Y. O. D. mine, and Mr. Lockwood, the electrician from the Westinghouse Co., San Francisco, is now here to start it going. The dynamo will be run by water power. The grounds surrounding the mill and hoisting works will be lighted with arc lights. Incandescents will light the shaft and the main buildings. There will be 75 lights of this character.

### Plumas.

STRUCK GRAVEL.—*National Bulletin:* The drift from the shaft of the Elizabethtown Channel mine has cut into gravel. As the gravel was struck in the upper part of the drift, and as the bedrock at that point is pitching, it is evident that the bottom of the channel is lower than the drift—miners estimate it to be ten feet. The gravel exposed is reported to be of very nice quality and, at this point even, to yield a fair prospect. Thus far the pump is handling the water with ease. If necessary, it could lift nearly double the present flow.

H. A. Swift, of Oakland, has bought the Pat Malloy mine at Bucks Ranch and will place it in operation.

### San Diego.

THE THOMAS MINES.—Yuma *Sentinel:* There arrived here yesterday from Stockton, Cal., for Supt. R. M. Strauss of the Thomas group of mines, from Mr. Lane, one of the owners of the famous Utica mine at Angels Camp, Cal., and also the principal owner of the above mines, a carload of wagons and two of horses. They will be put in use at once freighting from Blaisdell station to the mine.

Eight carloads of timbers for the contemplated mine are now on the ground. Next Monday the millwright of the Utica mine, with his assistants, is expected to arrive and active operations on the twenty-stamp mill will be commenced.

The machine for the new mill is now being cast and, with some nine miles of water pipe, is expected shortly.

This will, no doubt, be one of the richest mines ever opened up in this locality.

The Young America gold mine in Ogilby district has been located by H. Le Roy. J. Y. Byers has filed upon the Wonder mine in Deer Park district.

The Golden Cross Mining and Milling Company has mortgaged nineteen gold mines at Hedges, to secure the payment to Mary E. Hedges of $19,000 within sixty days.

### Shasta.

*Democrat:* Everything in the shape of mining property in and around Muletown is being bonded.

At the London and Burton mine at Muletown, owned by the California Gold Mining and Milling Company, the assays go from $9 to $18 to the ton. The company has concluded to push development work and open up the mine.

Fred A. Deakin will begin active operations at the Spanish mine in Texas Springs.

The Shasta County Development and Mining Company have begun active work on their group of mines in the Flat Creek district, near Iron Mountain. Twenty men are at work sinking two shafts and a tunnel running now 160 feet. Lumber and machinery are now on the ground for the new hoisting works. There will be three hoisting engines. There are eleven claims in the group, the principal one being the Alta mine. Ore bunkers are being built and filled and the Iron Mountain company are putting in two side-tracks to haul the ore, which they have contracted for, to the smelter at Keswick.

*Searchlight:* The heavy rains of the past week have proven a godsend to placer miners, who have been taking out dirt and awaiting water. E. P. Connor and sons have found a piece of ground at their Salt creek camp, a few miles out of Redding, that was overlooked by the argonauts. The ground is 50x400 feet in area, and evidently was at one time the bed of the creek. Several nuggets weighing a half ounce have been found, and the placer will pay the lucky prospectors good wages all winter.

The expected happened when, during the heavy rains, slide after slide filled the narrow cuts on the Iron Mountain road. The completed furnace will not receive ore for several months yet, although Superintendent Hill hoped to start before the end of January. The loss will be heavy, but as the loose overhanging earth had to be removed at any rate, it will not be as great as at first reported. As soon as the weather will permit the force of workmen will be increased largely.

A. W. Graham is down from the Shasta Development Co.'s property on Flat creek, and states the work there is progressing well. As soon as the buildings are completed the force will be increased and from twenty-five to thirty men will be employed in taking out ore, which will be treated at the Keswick smelter.

The back channel on Dog creek, near Delta, has been found, and the stockholders of the company that has been pushing development work there since last August are correspondingly jubilant. That a covered channel existed in this district, and that from this source came the heavy channel gold, has been recognized from the time that the surface diggings of this section were the richest in Shasta county. Pay was found in gulches from the north and on the main creek to a point about a mile and a half above Delta; here pay suddenly ceased. Many have tried to solve the mystery; shafts have been sunk; tunnels have been run, but mainly above the lava flow, and resulted in disappointment invariably. The attention of C. E. Brown, a local mining engineer, was called to the disappearance of the pay channel, and, after tracing the course, eight claims were located and deeded to C. E. Brown, Murray Brothers and M. E. Dittmar. These gentlemen incorporated the Ancient Channel Drift Gravel Mining Company, with $6,000 capital, made up mainly by local business men, though a few hundred shares of stock are held in San Francisco. Work was commenced on the theory that the channel carrying the pay was under the lava. A bedrock, crosscut tunnel was driven in 200 feet, and on last Thursday the channel was broken on an upraise, and its value was demonstrated from the first shot. Owing to the irregularity of the trains, no news has reached here since Saturday, but there is little doubt that a valuable find has been made. The gravel prospects well; $4 a car, or $10 a day to the man. This prospect is from the rim; when the bed of the channel is reached, much better results can be looked for.

The company is officered at present as follows: Thos. B. Dozier, president; George Deming, vice-president; C. E. Brown, secretary, and M. E. Dittmar, treasurer; these, with Jos. Kahny and Mr. Deistlehorst, make up the directorate.

Plenty of wood can be had on the claims, and Dog creek, a never-failing stream, flows past the tunnel's mouth.

### Siskiyou.

GENERAL MINING NOTES. — *Journal:* The Blue Gravel mine at Greenhorn started up yesterday, and two shifts will be kept constantly at work, as the recent heavy rain has furnished plenty of water, and some good work will now be done on this mine.

The mines on Barkhouse, which have been closed down for a few weeks, will start up again and continue all summer. These mines are expected to produce some very rich quartz this year.

Siskiyou is destined to be one of the greatest gold producing counties in the State. Her rapid strides towards the head of the list of gold producing counties last year has brought her great resources in that line under the eye of the investor, and her advancement this year will be much greater, especially if we have a favorable season for the miners, which means plenty of snow in the mountains. The rains of last week have sent many of our miners to work in a jubilant mood.

Some very favorable reports may be expected this year from Thompson Creek. The Seattle Placer Mining Company is investing a large sum preparatory to working the old Shinar claim on an extensive scale and with plenty of water. This is a fine property, and will fully justify its owners in making these developments.

The Espey, Hunter & Co. mine at Hawkinsville, has been steadily at work since the pumps were repaired. They were compelled to close down a few hours one day last week, owing to the high water in Shasta river.

At Cherry Creek the miners are supplied with an abundance of water from the late continuous rain storms, to carry on ground sluicing with good success. They have no use for the reservoirs at present and will sluice off a great quantity of the top gravel and boulders, which will enable them to wash up the rich bedrock gravel when the water supply is light, aided by the reservoirs in saving water during the night.

Fort Jones *Reporter:* Barton & Co., of Oak Bar, are constructing a mile ditch to bring water onto a high bar near Walkers. The bar is rich, paying from five to ten cents to the pan.

Culver, Humphrey, Hossick, McLeague, Pitts and Wallace have organized at Barkhouse for the purpose of working the creek, which is supposed to be very rich.

The Commodore mine, owned by Humphrey, Quigley & Billups, will start up again in a few days. They have just finished cleaning up from a seventy-ton crushing, which gave them $2560. John Quigley, of Oro Fino, is running the arrastras. He is a first-class mill man and amalgamator and made the rock go better than on any previous test. They are running a tunnel, about 220 feet lower than their present works, which they expect to finish in about six weeks. They have enough ore in sight to run them for years.

*Union:* The miners in all the gulches and small streams leading into Klamath river and its tributaries are now busy at work sluicing since the late rain storms commenced and all appear to be doing well. In the high hill diggings, where there is no water of consequence except from melting snow or while raining, good results are also obtained.

*Journal:* The mines on Barkhouse and in the vicinity of Oak Bar and Scott Bar are still closed down, but it is expected a number of them will be in operation in another month, when everthing along the river will be lively.

### Trinity.

CINNABAR.—A Castella correspondent of the Redding *Free Press* writes: S. Conway has the contract to pack all the quicksilver out this winter from the Altoona mine, and it keeps him busy. He started on the 15th of December and has already more than 400 flasks at the depot. He uses about forty horses, and has been compelled to erect more sheds at Castella, as also sheds at a certain point on the road. The Altoona mine at Cinnabar is turning out from twenty-five to thirty flasks of quicksilver per day. It is one of the richest mines in the world. Professor Noles of the Integral mine has come out for the winter. He says that the company has nine men employed in running tunnels. He believes the Integral to be immensely rich if he can get on the right ledge. The Altoona and Integral are in close proximity to each other, and it appears that the richest pay chute of the former is running direct for the latter.

## NEVADA.

THE DEAL OFF.—From Carson is reported the repudiation of the purchase of the Buckeye placer mines. The sale was made in October, '95, to Messrs. Lane, Hayward and

Hobart for $250,000, the purchasers giving a bond and paying $10,000 cash down. They also purchased from outside parties a water right or reservoir site on the headwaters of Carson river, to bring water through fifty miles of canal, ditch and flume to work the mines. This water right they retain. They started a survey of the ditch, located a large amount of ground adjoining the 1700 acres they bonded and put forty men at work prospecting and developing. The principal work had been done on the Black Horse claim or location in Buckeye canyon, where an open cut developed a bed of fine-looking gravel 12 or 15 feet deep, rich in coarse placer gold which sold at the Carson Mint for $19 per ounce. But what was called the bedrock was not generally considered to be so, and among the first of the new proprietory operations was to sink a shaft down into this bedrock; sunk to the depth of 153 feet through a wash deposit and no true bedrock. Some fair gold prospects were found all the way down, but nothing like that at the surface. Near the bottom of the shaft some beautiful pieces of silicified or agatized wood were found, being sections of the trunk and branches of a good-sized tree, which, judging from the formation and grain, must have been cottonwood. No finer or more beautiful wood petrification was ever found on the Pacific Coast. Its greatest significance, however, is a demonstration of the geological character of the earth at that particular point. Sinking deeper was discontinued by reason of too much water and the necessity of the erection of costly machinery for pumping and hoisting.

Various reasons are assigned for the abandonment of the purchase: that the property does not turn out as valuable or prospectively productive as was anticipated; too much trouble and cost in procuring and introducing the necessary water; big commissions claimed for parties securing the purchase and title; alleged trespasses by locators, etc. Anyhow the whole negotiation is off and the property reverts to its original locators and owners, residents of Ormsby and Douglas counties.

Buckeye is nearly 35 miles southeast from Carson and the mines are a discovery of the last three or four years. The Zirn mine (quartz) is in the direction, at Pinenut, 10 miles nearer. It is also bonded for $70,000, which is expected to be paid in a few days.

THE AURORA TAILINGS.—Bodie *Miner*: Courchaine, Stewart and Cottrell on the first of January located the Aurora tailings, which had been accumulating since the early days of that once famous camp. Owing to the great growth of sagebrush on these tailings no one realized the extent nor the value of them; but Mr. Courchaine, who had known of these for the past twelve years, was on the ground first and located forty acres, one-half of which is covered with rich tailings. These gentlemen have a snug fortune awaiting them in the working of these tailings by the cyanide process. They will begin work on them about the first of April, or as soon thereafter as possible.

STOREY COUNTY.

THE MILL TO BE ENLARGED.—On the front page of this issue is an illustrated description of the Kinkead plant on the Con. Va. waste dump. The *Enterprise* says the plant has been running smoothly for over two weeks. During these two weeks the mill has demonstrated that the undertaking is a success in every sense of the word. The rock from the C. & C. dump, on which the experimental run has been made, has yielded sufficiently to demonstrate that the plant will pay. Mr. Kinkead has let a contract to enlarge his mill to twice its present capacity, and the work on the addition to the present building will be commenced soon. He says that, unless he could make rates with the Selby Company which were entirely satisfactory to himself, he would build a roasting furnace there to treat the concentrates which his plant produces. Sulphur is the only base metal contained in these concentrates and this can be drawn off, Mr. Kinkead estimates, at a cost not exceeding the cost of transportation of the concentrates to the Bay.

LINCOLN COUNTY.

De Lamar *Lode*: Upwards of $200,000 has been expended on developments on the Jim Crow and Monitor, and in the erection of the milling plant, the development of water with which to operate it involving about half of that sum. Nearly 10,000 tons have been put through the mill, however, from which $650,000 has been derived, while with additional stamps that are now being shipped from the East the earnings in 1896 will far exceed those of any period since the purchase of the property by its present owner. Every modern improvement is to be found on the property, the ores being conveyed from the mines to the mill by a tramway, while a coach with three guards is employed to deliver the bullion product at Milford, a distance of 170 miles.

SPRING VALLEY DISCOVERIES.—Concerning recent discoveries near Spring valley, the Pioche *Record* says they are thirty-two miles from Pioche, about twelve miles east of Spring valley, and in a range of mountains suspected for a long time to be valuable for mineral, but on which no particular locations have heretofore been made. The Millett and Rice boys of Spring valley appear so far to have the best locations. The ore is of a quartz character and was first tested and prospected for gold. Returns of about $20 to the ton were the best obtained, until it was suggested that some parts of the stuff looked more like silver than gold ore. It was found then to carry about $50 to the ton in silver.

This discovery brought in parties from the outside, and the location of new ground by all parties, rather than a development of what they already have, has taken up the time since. It is less than four weeks since the general value became known, but in that time the country for a distance of seven miles has been staked off. The result and experience following the location of claims in Ferguson district induces the prospectors of the new camp to look very carefully after their fences before the crowd comes in.

A miners' meeting took place on the 20th inst., to regularly organize a mining district. The mineral belt crosses the State line between Nevada and Utah, running northwesterly and southeasterly, and one of the best claims lies partially in both States, as is seen by one of the boundary-line monuments, which stands out prominently close by.

APRIL FOOL LEASE EXPIRES. The lease held on the April Fool mine by Frank Wilson and W. J. Dooley having expired, the property will be handled by Wilson for the owners, who propose to work it on its merits. The two cars of ore just shipped brought $43,000 in Salt Lake.

EUREKA DISTRICT.

Thos. Wren writes to the *Sentinel* as follows: Few persons who have never resided in Eureka are aware that Eureka has been one of the greatest gold-producing districts on the Pacific coast. Outsiders have known Eureka as a great lead-smelting center in the past, and smelting and gold mining are not associated in the minds of most persons. Nevertheless, Eureka has added to the world's stock of gold, at a very low estimate, ten millions of dollars.

At some future time I propose to give the exact figures as far as they can be ascertained from sworn returns made to the assessor. Some of the gold ores have a quartz gangue and could probably be reduced and the gold saved by mill process. Other gold ores have an iron gangue and the best method of working these ores has not yet been determined by practical tests. There are scores of mines in the district containing gold ores assaying from $60 a ton to $100 and upward. These ores are generally associated with silver and lead ores. The lead rarely carries much gold, but is rich in silver. The gangue of the gold, when not quartz, is iron. Owing to the difference in specific gravity, appearance and hardness, there should be no difficulty in separating the silver-lead ores from the gold ores. The silver-lead ores bear shipment to Salt Lake, where they find a ready market, and the $8 and $10 gold ores should be worked here by some of the many processes for reducing gold ores and saving the gold. The cost of shipment of these ores to a market—$6 a ton and upward—would pay an enormous profit if they were worked here. Our large companies—the Eureka Con. and Richmond—have fine smelting plants lying idle, but they do not seem inclined to try working ores by any process except smelting. Gold ores assaying up into the hundreds have been taken out of the mines of the Eureka Con. and shipped away to find a market elsewhere, while the poorer ores that would not bear shipment went over the dump. In the meantime our people seem almost paralyzed by the adverse silver legislation and the low price of silver, and scarcely an effort is made even to call the attention of investors in gold mines to the value of this district as a gold-mining district. Why not wake up and tell the outside world what we have here, what we have done and what may be done? By a little concert of action, without expending any considerable sum of money, we can attract attention to the district at least.

## OREGON.

GENERAL SOUTHERN OREGON NOTES.—The Ashland mine is preparing to ship a car of ore to the Selby smelter.

H. M. Hicks, in Cottonwood mining district, on south side of Siskiyous, has a force of men in placer operations at the Hicks & May claim there. Placer miners along the smaller water courses are "making hay" now while the water lasts.

A working test of ten tons of ore from a ledge which B. F. Wagner uncovered west of Ashland, near the Ashland mine, was made at the Hicks quartz mill last week, yielding $16.50 per ton.

The sheriff has attached the Hammersly mine for Jones & Otten of Gold Hill.

Over in the Applegate country there is activity in placer mining. The Sterling mine people are confident of cleaning up over $100,000 this winter.

G. Bartlett, McMullan Creek, Deer Creek district, is locally reported to have received $75,000 for his prospect near Preston's peak, about thirty-two miles west of Kerby. This is supposed to be a great strike and Mr. Bartlett demands $100,000 for it. The lowest assay is as follows: Gold, $40; silver, two ounces; copper, 40 per cent, or 800 pounds to the ton. The ledge is twenty-seven feet wide.

THE VICTOR.—W. W. Taylor, of the Victor, has returned from this city where he recently contracted for $150,000 worth of additional pumping machinery. Within the last ten months he has expended nearly $65,000 on the Victor, principally on the present pumping plant which has yielded 52.8 ounces of gold on a ten days' run. When the new pumps are added, the whole plant will run ten 4-inch nozzles the year around—the first instance of hydraulic mining on such a large scale in that section. The water has a 300-foot head and ten 4-inch nozzles under such a pressure will do considerable amount of work. Col. Taylor last week showed the Ashland *Tidings* a letter which he had received from his friend, Lord Stanley, of England, only the previous day stating that he had £50,000 ($250,000) which he desired to invest in gold mines out here, and asking his interest and advice in the matter.

WALDO COPPER MINES.—In the copper mines near Waldo the vein has widened out into a good sized ledge of carbonate of copper and black oxide of copper ore, the former carrying 36 per cent and the latter 54 per cent in copper. The company will at once erect its smelter; within six weeks two smelters will be running in Josephine county. The Elmer Brown Copper Company has had the machinery—save the blower—for this smelter on the ground for several months, partly in place and housed. The mines are about five miles southwest of Waldo, in Page gulch. The main ledge is about 4' feet wide and pitches from west to east. The development work consists of a tunnel on the south side of the creek 120 feet in length, a shaft on the north side of the creek 85 feet in depth, and two tunnels and a shaft a short distance to the southwest and about 900 feet above the creek. The force at the mines will be increased.

*Journal*: Two giants are running night and day at the Hampton & Lewis mine on Grave creek. This is one of the largest placer mines in southern Oregon. It now has a water supply of more than 4500 miners' inches and will next season have 1000 inches additional.

## BRITISH COLUMBIA.

A Vancouver dispatch says: American capitalists have purchased the Best, Idaho and Mountain Chief mines, near New Denver, for $90,000. They have also bought up all the claims for sale in the vicinity.

THE NELSON SMELTER.—*Spokesman-Review*: After numerous delays incident to the starting up of a smelting plant, the Nelson smelter blew in on Wednesday morning, and, much to the surprise of the owners, ran through 120 tons of ore the first day. The plant was purchased with a view of treating only 100 tons daily. The matte is 50 per cent copper, and 10 tons of ore are required to make one ton of matte. The value of the matte is about $250 a ton.

It was confidently expected that work would commence on the first day of January, but there were numerous vexatious delays which prevented. Sir Joseph Trutch was watching everything with a great deal of interest and expressed himself as being more than pleased with the result of the first day's work.

PILOT BAY.

THE BLUE BELL MINE.—During '95, the Blue Bell mine, 10 miles up Kootenay lake from Pilot bay, produced 51,361 tons ore. There was shipped to the works 2994 tons of lime rock. The smelter was put into operation March 16; to December 31 there was produced 6,440,000 pounds. The mine and smelter are owned by the Kootenay Mining and Smelting Company. A. B. Hendricks is general manager.

The Pilot Bay smelter started up last week.

## UTAH.

Capt. DeLamar has bonded the Viking, Mercur district, for $36,000.

An English syndicate has bought a group of properties owned by the Searchlight Mining Company adjoining the Sunshine Mining Company, Camp Floyd district, for $150,000 cash. C. W. Miles will manage the property.

"THE AMERICAN JOHANNESBURG."—Those who have examined the Mercur district and are familiar with the Rand in South Africa point out several similarities. The lodes are not unlike and the same oxidized arsenical ores are to be found in Mercur as in the South African district. The best values are said to be found near the porphyry channels in both instances.

The hanging wall is of shale and the foot wall of lime, but between these are a variety of mineralized bodies, all of which seem to carry gold to a greater or less extent. Half a dozen tunnels have been run into the mountain and by means of upraises and winzes the ore is economically sent to the surface. The ore channels vary from 5 to 25 feet. The ores are of a grayish blue or black color, and in appearance are deceptive. Their values run from $3 to $20 dollars a ton, the average running about $12. The ore can be mined and milled for something under $2 a ton. In the Mercur property the work of breaking ore begins at the terminal wall, and when all has been removed from the chimney the timbering that has been necessary for such work is removed and the walls allowed to collapse, the men meanwhile working towards the outlet or tunnel.

A great deal of prospecting has been done from the various tunnels, and a double compartment shaft is being sunk, to learn what there is further down the mountain.

The Mercur mill has a capacity of 200 tons a day, and the Mercur property keeps it going all the time.

## IDAHO.

The most important feature of the mining development of the State during '95 was the development of the Boise gold belt. It is now known that a gold belt extends from Camas prairie on the southeast in a northerly direction to and beyond the Willow Creek district. In a general way, the mines of Elmore and Ada counties, together with the Willow Creek district in Boise county, are located on this belt, and wherever development work has been prosecuted on this belt, satisfactory results have rewarded the operators.

A company has been organized in Chicago that proposes to operate on gravel bars at the Horseshoe bend of Salmon river. The object of the company is to run a cut through the neck of the bend, a distance of 13,000 feet, and turn the river into a new channel, some feet lower than the original channel, and thus drain 9000 feet of the present bed. It is supposed there are millions of dollars of gold in the bed of the river. The enterprise will require the expenditure of something like $100,000.

Harry Thompson, manager of the Bear creek bedrock flume enterprise, in Elmore county, has gone to Scotland, the home of his company. He will return in the spring with funds to continue operations. The company has already constructed 2220 feet of double flume and is now about ready for productive operations; it has expended $45,000 in prosecuting the work, but much barren ground had to be run through to reach the pay dirt.

The mining exchange recently organized at Boise City is not intended to be a mining stock board, dealing in and listing mining stocks, but rather a bureau of information for collecting and imparting information relating to the mining industry in Idaho.

CAMAS NO. 2.—The Camas No. 2 mine, twelve miles from Hailey, recently purchased by H. K. Thurber and others of New York City for $250,000, paid in December a dividend of $17,000 and in November $15,000. This was the product of an old twenty-stamp mill. Mr. Thurber has decided to build a double-compartment shaft through which to work the property and will put in machinery of sufficient capacity to work the mine at the depth of 1000 feet.

A snowslide near the Star group of mines, near Hailey, on the 17th, carried the blacksmith shop, together with two men, half a mile down the gulch. One of the men, George Hague, is missing, and it is believed he has been killed. A strike of a seven-foot vein of galena was recently made in this group, which belongs to the Vanderbilt Milling Co. of Salt Lake City.

## MONTANA.

*Inter-Mountain*: The Missoula Gold Mining Co. has been organized to operate the San Martina mines in Missoula county; H. S. Corbett, president; H. L. Frank of Butte, treasurer; W. Q. Ranft, secretary. The company is said to have the necessary financial backing.

GILT EDGE MINES.—H. S. Sherard of Gilt Edge has negotiated a deal whereby the New Year and some adjacent mines in the Judith mountains, belonging to W. G. Norman and Adolphus Harmon, have been bonded for $100,000, for one year, to New York capitalists. The first payment, $25,000, is to be made May 1, 1896; the second, $25,000, Sept. 1, 1896, and the third, $50,000, Jan. 1, 1897. There shall be deposited in the Bank of Fergus County, before work commences, a forfeit of $5000.

Basin *Times*: The whole of the Cataract along Cataract creek, including the Eva May, is now under the jurisdiction of the Basin Miners' Union, whose schedule for underground work is $3.50 a shift. President Padden and Secretary Sprout of the Basin Union had an interview, the latter relinquishing their claim, as the mine is adjacent to Basin since the completion of the road, which was built by Butte money.

Butte *Miner*: There is a sure enough boom on in men seeking leases on property. This leasing mania is not confined to copper and gold properties, but silver as well.

## WYOMING.

From Collins comes news of a mining excitement in the mountains about twelve miles west of that place. The new camp is in Independence mountain, and several claims are being operated. Development has not proceeded far enough to justify any opinion regarding the camp, but values have been found in almost every claim, and one claim has been sold for $12,000 cash.

## NEW MEXICO.

The *Miner* of Kingman, N. M., reports the discovery of a gold ledge in that vicinity a few days ago "which assays 105 ounces in gold."

## COLORADO.

LA PLATA COUNTY.—(Special Correspondence).—The heavy snows in November put a stop to most work in these hills. Only a few mines had foresight to put in supplies for winter. The Little Kate mill in Basin gulch had already proved a success. If the mill assayer's report is true, the mill saved all the gold in the ore, tailings not showing more than a trace—a most remarkable showing; and if the ore continues to be so entirely free, the owners certainly have a bonanza. The ore thus treated is surface ore, having a value of $8 per ton.

The Bromination mill in Lewis gulch made a short run on ores from different properties, demonstrating to the satisfaction of all concerned its possibilities in working refractory gold ores. In many instances 90% of the gold value was extracted. This process has the objection that, by using same, the silver is lost; and as most La Plata ores run from two to twenty ounces in that metal, the process is too expensive in its cheapness. Many large bodies of pyritic ore will contain about 0.5 ounces gold and 17 to 20 ounces silver, and that class cannot be handled at this mill.

The Columbus did not get the coal supply up before the storm, so sinking had to be stopped; but a few men are drifting on the vein and on the 100-foot level.

The Small Hope is greatly improving in size and quality as depth is gained.

The Durango Girl is working four men, taking out some very rich tellurium ore. This claim, with 280 feet of development, has shipped $7000 worth of ore, taken out during drifting on the vein with little or no stoping.

Durango, Col., Jan. 14, 1896.

AT WARD.—Col. Brainerd is adding machinery to his mine and mill on Left Hand. Last week he received a 500 horse power Leffel water wheel and three more will follow soon. A company, of which Lyman J. Gage of Chicago is at the head, is backing him. It is claimed that a number of years ago this company set aside a million of dollars, the interest of which is spent annually in development work.

THE GOLDEN FLEECE.—The Golden Fleece Mining Co., at Lake City, Colo., report that from September, 1892, to January 1, 1896, there were 5,772,245 pounds of high-grade ore shipped, having a value of $722,022.78, and 1,979,806 pounds of milling ore treated, valued at $7,229.41, making a total of $729,252.19. The expenditures during that time amounted to $213,830.64, leaving a profit of $515,421.55, of which amount $401,979.85 was paid in dividends, leaving a surplus of $113,441.70 at the beginning of '96.

The Leadville *Herald* says: Twelve months ago the output of the camp was not over 1000 tons per day. To-day it is probably 1300 tons, with every indication of an increase. The de-

mand for iron is steady and all the smelters report an ample supply of ore.

The Victor Mines & Land Co. paid dividend No. 9, of $3000, on the 20th inst., making a total of $27,000, of which $24,000 was paid in '95.

### ARIZONA.

Pearceville is the name given to the new town at the Pearce mine. A stage line has been started connecting the new camp with Fittsburg and Tombstone.

The English company at Harqua Hala have dismantled their mine and leased the property to Arizona miners.

The Congress Mining Company's monthly pay roll amounts to about $400,000.

Globe *Belt:* At the Buffalo smelting works, owned by the United Globe mines, a large force of workmen is getting the plant ready to begin smelting. It has been entirely remodeled, and, while not yet complete, the work is sufficiently advanced to start one furnace. It is a 36-inch jacket with a daily capacity of 45 tons, and another furnace of the same size will be erected and blown in at an early date.

Robert McBroom is superintending the work and will have charge of the plant. Mat. Cavaness is hauling ore from the Buffalo mine and a pack train of 36 burros is delivering about 18,600 pounds of ore daily from the Carrie and Buckeye mines. The rock crusher has been running several days, and the supply of ore will be ample for two furnaces. Coke is arriving freely and the bins are almost full.

At Lost Gulch, eight miles from Globe, the Kasser Gold Mining Company is running ten stamps, with two Frue vanners, and showing good results. Two more Frue vanners will be up inside of a week. They are only running from 14 to 16 tons of ore per day so as not to crowd the vanners too much. Some of the ore is free milling and some concentrating, and the plates and Frue vanners are doing fine work. The concentrates average 40 to 50 per cent lead, and from $80 to $120 per ton gold.

AT JEROME.—*News:* At the United Verde Copper Co.'s works the improving and enlarging of the smelter and mining machinery is being pushed; it is thought that two months more will see all improvements finished and production doubled. The new iron addition to the smelter has been raised. The new electric power engine is in place, and Jerome will have an improved electric light service in a short time. The 500-foot tunnel is being enlarged so that the electric trolley system can be introduced to move cars of ore from the mines to the roasts. When completed, the facilities for the perfect and systematic working of these mines will compare favorably with any in the world.

A LARGE STATEMENT.—Mojave *Miner:* This week a sale of twenty-eight mines in Gold Basin was made to a Scotch syndicate represented by Messrs. Stuart and Orr, of Scotland. The amount paid is stated to be $250,000, and the mines are the Patterson and Schaefer group. Charles Pickenbach, who managed the Harqua Hala mines for Hubbard and Bowers, is the superintendent for the new company. All the water rights in the neighborhood of the mines have been bought up and will be thoroughly developed and brought to a point where they can be used for milling purposes. At least $500,000 will be used in developing the mines and erecting an immense plant for the extraction of the gold and silver in the ores.

YARNELL.—*Journal-Miner:* The Virginia Gold Mining Co is working a force of thirteen men in the Yarnell mine, which consists of three claims. The Juniper has a 700-foot shaft, with levels run every seventy five feet. The Mother Lode claim has a shaft down 375 feet, with levels run at 130, 200 and 260 feet.

### LOWER CALIFORNIA.

TO MINERS.—*Lower Californian:* The Custom House of Todos Santos has given information to the Treasury Department of the City of Mexico that very frequently there arrives at this port *gambusinos* (prospectors), bringing with them small quantities of gold dust, coming from places where no stamp offices exist, whose duty it is to make the invoices provided for by Art. 26 of the Regulations of June 26, 1895, or which are situated within the zone of forty kilometers referred to by Art. 35 of said regulations, and that said custom house further states that those small quantities of gold dust are sold or exchanged for provisions to local merchants, where periodically said gold dust is accumulated in sufficient quantities for exportation, and in order that this mineral shall not be comprised within the penalties established by subdivision 12th of Art. 61 of said regulations, the President of the republic has considered it proper to determine that in the sea ports, where transactions of this kind shall take place, that all merchants or purchasers of those small quantities of gold dust shall be required to keep a memorandum authorized with the seal of the custom house, wherein the said office shall make entries of the value, weight and nature of all said mineral verbally reported to the said office by said merchants, or other persons having so purchased in the locality, to the end that said entries or reports shall be considered as evidence and basis of the invoice required by law to be used upon the exportation of said gold dust. * * The above order was issued in the City of Mexico, Dec. 23, 1895, and is now in effect at the Ensenada Custom House, and the Collector, Don Pedro Victoria, will receive the gratitude of the mining community in having simplified a regulation which prospectors and small miners found great difficulty in complying with.

PROF. GEORGE F. BECKER writes that in regions near the pole, ice is as much a rock as limestone. This may remind some who might not have thought of it otherwise that the essential difference between ice and granite, considered as rocks, is merely a matter of the greater or less degree of heat it takes to "thaw" them.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR THE WEEK ENDING JANUARY 14, 1896.

553,148.—STOVE—C. W. Barzee, Wasco, Ogn.
553,150.—STEERING GEAR—C. E. Bergman, Everett, Wash.
552,952.—CONCENTRATOR BELT—W. F. Bowers S. F.
552,954.—ELECTRIC RELEASE—J. W. Chute, San Jose, Cal.
553,105.—CAN OPENER—W. G. Cogswell, Los Angeles, Cal.
552,995.—CONCENTRATOR—John Frey, Berkeley, Cal.
553,004.—SAW SWAGE—B. LaFleur, Hilgard, Ogn.
552,963.—TREE FELLER, ETC.—J. Lomas, Ashland, Ogn.
553,133.—MAIL DELIVERY FOR BUILDINGS—L. J. Pechner S. F.
552,924.—ELECTRIC RELEASE—S. H. Reynolds, San Jose, Cal.
553,089.—PIPE COUPLING—D. C. Wilgus, Los Angeles, Cal.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

EVAPORATOR.—Jeremiah Wellington Mote, Wilbur, Oregon. No. 552,667. Dated Jan. 7, 1896. This evaporator is especially for drying fruit and consists of an outer shell, an inner wall concentric therewith and forming between itself and the outer shell an annular space, a source of heat communicating with the lower portion of said space, a rotating frame within the upper portion of the space and a tray-carrier mounted upon said frame and independently rotable or adjustable thereon. The object of the invention is to effect a perfect distribution of the heat and an even exposure of the fruit to the heat, so that the drying shall be equable throughout the entire charge.

AUTOMATIC ELECTRIC RELEASING DEVICE.—John W. Chute, San Francisco, Cal., assignor of one-half to James White. No. 552,954. Dated Jan. 14, 1896. This invention relates to an automatically operating release and resetting device which is applicable to open gates or doors, to disengage horses from their fastenings, to release any mechanism, and for other similar purposes. It consists of a swinging, spring-actuated arm and a latch lever therefor, an independent disengaging lever, an electro magnet and an armature-carrying lever by which the disengaging lever is normally held in position, together with a curved attachment carried by the swinging arm, and a lug upon the releasing lever adapted to be engaged by the attachment when the arm is disengaged and moved whereby the releasing lever is returned to its normal position and engaged by the armature lever and set in readiness for the new operation. In conjunction with this is a spring-actuated bell crank lever, fulcrumed with relation to the latching lever so as to strike and disengage it when released, and a catch by which this lever is normally retained out of contact or engagement with the latch.

MAIL DELIVERY FOR BUILDINGS.—Louis J. Pechner, San Francisco, Cal. No. 553,133. Dated Jan. 14, 1896. The object of this invention is to provide a simple and effective means to be set in operation by the postman upon depositing the mail for carrying said mail to the several floors or flats of large buildings, and depositing it at the proper points, giving notice at the same time of the operation. The device consists essentially of a box for the mail, an endless traveling cable connected with said box and adapted to transfer it to an upper floor of the building, and to return it to its initial point, a means for operating said traveling cable, a receiving receptacle at said upper floor, and automatic connections whereby the box, upon reaching the receiving receptacle, automatically discharges its contents into said receptacle. The device is operated by an electric motor, which is provided with means for throwing the circuit into and out of action.

TREE-FELLING AND LOG-SAWING MACHINE.—Joseph Lomas, Ashland, Or. No. 552,963. Dated Jan. 14, 1896. This device, as its name implies, is for sawing trees and logs, and especially for cutting both standing and fallen timber, and is applicable on mountain sides or elsewhere. The object of the invention is to provide a machine for this purpose, the power for which is derived from compressed air or steam, or other suitable medium, which is conducted through a hose or other conduit to any distance desired, whereby the machine, itself, which is firmly attached to the tree or log in any position or on any ground, no matter how steep, rocky, or swampy, may be operated within a given radius without the necessity of moving the source of power. The machine consists of a frame, a cross-beam adapted to slide up and down thereon by means of chains and pulleys, an engine carried by the cross-beam and adapted to be operated by suitable medium, a saw connected with the piston rod of the engine, and suitable dogs for holding the frame to the log.

CONCENTRATOR BELT.—Wm. F. Bowers, San Francisco, Cal. No. 552,952. Dated Jan. 14, 1896. The object of this invention is to provide a simple and practicable removable flange for a concentrator belt. The flange is provided with a flaring wedge-shaped base, and the belt is provided with an under-cut or dove-tailed groove adapted to receive the wedge-shaped base of the independent flange, the walls of said groove being so constructed that they will automatically fold down and clamp the base of the flange, as the belt passes over the terminal drums.

# Professional Cards.

**JOHN W. GRAY, Mining & Hydraulic Engineer.**
Explorations, Examinations, Reports, Surveys, Maps, Development and Working of Mines. Correspondence invited from those wishing to make investments in mines or secure and develop promising claims.
**Res.—923 Linden St., Oakland, Cal.**

**W. J. ADAMS, E. M.,**
**PRACTICAL MINING ENGINEER.**
Graduate of Columbia School of Mines. Expert on general mill work and amalgamation. Fifteen years' experience. Specialties: The saving of fine gold; vanner concentration and chlorination. Address Golden King M. Co., Alleghany City, Sierra Co., Cal.

**Mark B. Kerr,**
**MINING ENGINEER**
—AND—
**Deputy U. S. Mineral Surveyor.**
(Formerly Topographer U. S. G. S.)
**Valley Springs,.....Calaveras Co., Cal.**
Surveys executed and U. S. Patents obtained for Mining Claims, Mill Sites, etc.
S. F. address care Judson & Shepard, 402 Front.

**LOUIS FALKENAU,**
**STATE ASSAY OFFICE,**
**434 California St., near Montgomery.**
Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.
Court Experting in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

**The Evans Assay Office.**
W. N. JEHU, - - - - Proprietor.
Successor to Jehu & Ogden.
**628 Montgomery Street, San Francisco.**
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

**School of Practical, Civil, Mechanical,**
**Electrical and Mining Engineering.**
Surveying, Architecture, Drawing and Assaying.
**723 Market St., San Francisco, Cal.**
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
☞ Send for Circular.

F. H. HARVEY. W. S. HUTCHINSON.
**HARVEY & HUTCHINSON,**
**GALT, CAL.,**
**Mining and Metallurgical Work in All Branches.**
Assays, Chemical Analysis of Ores and experiments on rebellious ores for treatment by cyanide or other processes. Surveys and reports upon mining properties.

W. B. TAYLOR. H. C. WARD.
**Nevada Metallurgical Works,**
Established 1869.
**Ores Crushed and Sampled and Working Tests Made by any Process.**
Assaying in all its branches.
Analyses of Ores, Minerals, Water, Etc.

FOR SEVENTY-FIVE DOLLARS

This College instructs in shorthand, typewriting, bookkeeping, telegraphy, penmanship, drawing, all the English branches, and everything pertaining to business, for full six months. We have a large corps of teachers and give individual instruction to all our pupils.

A Department of Electrical Engineering

Has been established under thoroughly qualified instructors. The course is thoroughly practical. Send for Circular. C. S. HALEY, Sec.

## Coast Industrial Notes.

—The Port Blakeley, Wash., mills have let a contract for cutting 800,000,000 feet of logs.

—The Oregon census of '95 gives that State a population of 362,000—a gain of 48,000 since '90.

—Last Friday overland freights on borax, canned goods and wines from this State were advanced from 50 to 75 cents per hundred.

—About 400 men are again at work at the Sugar Refinery in this city, which, it is thought, will run continuously through '96.

—During last month there were received here 2904 flasks of quicksilver, making a total for 1895 of 31,024 flasks, against 25,717 in 1894 and 24,227 in 1893.

—Real estate in Fresno is said to have advanced 30 per cent in value as a result of the Valley railroad. The first check the Valley road has received is in that town.

—San Diego's City Council has adopted its City Engineer's plans for the new water works and is about to accept the bid of the Mountain Water Co. for $1,500,000.

—The Northern Pacific Railroad Co. talks of building all its freight and passenger cars at Tacoma, Wash. A large quantity of coast timber is now sent East for car-building purposes.

—It is proposed to begin construction of the Clear Lake and Napa Railway about May. It will be 72 miles long and will cost $700,000. Storage batteries will be established every 15 miles.

—The Manufacturers' and Producers' Association propose to hold an exposition of California products at this city next April. The annual meeting of the stockholders will be on February 5th.

—Oregon and Washington sawmills shipped 29,915,743 feet of lumber here in December, 1895. California mills shipped 12,765,070 feet, making the total receipts at this port 42,680,813, as against 26,494,924 feet in December, 1894.

—The Board of Directors of the Mechanics' Institute has decided that the next annual fair begins on September 1st and closes October 3d, and that it will include a display of the natural products of the State and a complete exhibit of manufactures.

—Bliss & Son of Nevada are having built at the Union Iron Works a steel steamer which is to run on Lake Tahoe at the rate of twenty-three knots an hour. They also propose to build an electric road from Truckee to Lake Tahoe and build a large hotel near the lake.

—This week the Pacific Rolling Mills resumed work, about 700 men on the payroll. During the two weeks the furnaces have been altered to admit the use of oil for fuel. The Mills expect to use about 100,000 barrels per year. This industrial establishment is the first on this coast to make so general a use of oil fuel in blast furnaces.

—Francis Smith & Co. of this city have shipped 312 tons 30-in. steel pipe to the Cariboo, B. C., mine of the Horsefly G. M. Co. It goes by steamer to Victoria, B. C., thence by steamer to Vancouver, B. C., then by rail to Ashcroft 200 miles, then on snow sleds 170 miles north to the gravel ground; the freight bill will be a little over $15,000.

—F. M. Smith, "the borax king," has at last succeeded in his project of placing his product on the European market. His original idea was to ship the crude borax from here to Liverpool, a build a refinery there. Since his recent European trip he figures that he can do about as well by selling the raw material to the Liverpool refiners, and on this basis a large percentage of the borax product of this State will be sent.

—During December, '95, the value of breadstuffs exported from Pacific Coast customs districts was as follows: Oregon, Or., $16,220; Willamette, Or., $681,196; Puget Sound, Wash., $332,433; San Francisco, $1,578,974; total, $2,608,823. The total value for the past twelve months ending December was $22,732,108, against $17,102,595 for the previous year. The exports for 1895 included 3,341,393 bushels barley, value $1,377,050; 30,115,573 bushels wheat, value $16,322,305; and 1,718,089 barrels flour, value $4,905,588.

—In December, '95, the Port Blakeley, Wash., mill beat the mill record of the State by sending out 14,989,512 feet in December: the total shipments from the ten largest mills in the State footed up for that month 47,502,584 feet. The total receipts at San Francisco for that month were 42,680,813 feet as against 26,494,924 feet in December, 1894. The mill at Port Blakeley leads in the total of its shipments for 1895—106,426,403 feet—an average of about 30,000 feet a day the year round.

—Los Angeles oil men have "got together" and combined to stop the cutting in oil rates. There are about 400 of them. Last July, crude oil brought 75 cents a barrel. It has got down to 30 cents, and though of 15 specific gravity and of this 25 per cent asphalt and 6 per cent sand, is susceptible of economical use under large boilers under forced steam draught. So far the freight to San Francisco has been about 60 cents per barrel. Freights went up yesterday and the Los Angeles men are tired of producing for the benefit of the carrier.

—Another phase in the fortunes of the Nevada Southern Railroad is furnished in the incorporation of the Southern California and Salt Lake Railroad Company at Los Angeles last Monday, "to construct and maintain a standard gauge railroad from the Needles, Cal., to Milford, Utah." Connection will be made at Blake with the Atchison, Topeka and Santa Fe Railway, thence running northeasterly through the southern portion of Nevada to Milford, 295 miles, where junction will be made with the Union Pacific system; capital stock, $7,000,000. A. B. Hotchkiss of Los Angeles is one of the trustees of the road and an attorney for the Southern Pacific. He says the road will be commenced within six months.

—Daniel Best, San Leandro, Cal., has built a train of traction engine and wagons for the Crystal Rock Salt Mining Co. for use on the company's road, 32 miles long, from the mine to the A. & P. station. The company produces salt of fine quality, pronounced by assayers equal to the Liverpool imported. It has recently incorporated with $500,000 capital in this city and controls about 1000 acres of "mining ground" in San Bernardino county about 50 miles west of The Needles on the Colorado river, from which the salt is mined in large crystal blocks.

—The *Review* says that a new feature in the flour industry has recently developed in Washington State trade with Guatemala. The flour is packed in 100-pound sacks, which, when thus packed, is admitted free of duty to the ports of that country. The Washington mills have worked up considerable trade with Guatemala and Chile, which is increasing rapidly. Ships load with flour and lumber at Tacoma and Seattle and return with cargoes of coffee and cocoa. The export trade has grown so that sixteen steamships will ply between Puget Sound and the Orient, beginning in April. The trade has hitherto been carried by six steamers. Flour as a staple article of food is rapidly supplanting rice in China and Japan.

## Personal.

Capt. A. H. Ward returns to his Mariposa Co. property next week.

Prof. Thomas Price and Melville Attwood have returned from Grass Valley.

Tirey L. Ford arrived at Washington, D. C., yesterday and is at the Hotel Normandie.

Maj. Frank McLaughlin is at Paso Robles and will return to Butte Co. about Feb. 15.

W. C. Quiney has returned from an extended and successful business trip to Australia.

E. B. Dunham is succeeded by Supt. Ball in the management of the Gold Bar mine at Sawyer's Bar.

J. F. Lansing, of Butte, Montana, has assumed the management of the Trail Creek, B. C., smelter.

Jno. L. Truslow of Santa Barbara is the reputed successor of C. H. Speers as assistant Gen. Pass. Agt. of the Atlantic and Pacific.

John Howell, late manager of the Broken Hill Proprietary, Australia, is at the new works of the smelting company at Illawarra, N. S. W.

G. W. Garside, Fuseter Bay, Alaska, expects to have the new Willoughby mill finished by Feb. 1st. Five tunnels are being driven with satisfactory result.

Dr. Schiedel is visiting the Thames, New Zealand. It is understood that he will fill the position of supervisor of the Waihi, Waite Kauri, Crown and Woodstock mines, recently occupied by the late Richard Spratt.

Geo. B. Milburn, well known at Candelaria, Nev., and Shasta, Cal., was recently killed in a fight with marauders at Selukne, Matabeleland, South Africa, where he was at work for the Dunraven Mining Co.

Capt. Thomas Mein, one of the California miners under arrest in the Transvaal, South Africa, was once a miner in southern Oregon, and was superintendent of the Ennis & Cameron mine on Galice creek. From California he went to Venezuela and then to Alaska, where he was foreman of the Treadwell mine.

Mr. W. S. Keyes was recently elected to the board of trustees of the Academy of Sciences. President Jordan of Stanford University was recently elected to the highest administrative office in the Academy, and the new movement will doubtless add to the practical efficiency of that scientific body.

Prof. Jas. Bryce, the distinguished political economist, has returned to Great Britain from South Africa. In an address last Saturday before the Edinburgh Chamber of Commerce, he estimated that the Transvaal gold mines would produce £700,000 worth of gold. Should this estimate prove correct, he added, the ratio between gold and silver might need altering.

Clarence King is inspecting the Old Dominion mine at Colville, Wash. The owner, G. B. Dennis, contemplates the proposition of putting in a big machinery plant at the mine, and commence shipment of the ore product. The Old Dominion is developed now to a capacity of from fifty to seventy-five tons of ore per day, that will represent a value of $100 per ton.

## Obituary.

"Doc" Shurtleff, a typical '49er and a man who made and lost several fortunes in gold mining, died at Sacramento last Saturday. In Placer county he took out over $100,000 from the Ophir, near Auburn.

Thomas Prosser, senior member of the firm of Thomas Prosser & Son, 15 Gold street, New York, died on the 10th inst. at his home in Brooklyn. Mr. Prosser was for forty years the American representative of the Krupp Works of Germany.

An alleged letter from Mr. J. H. Hammond to the Santa Rosa, Cal., postmaster, dated Mashonaland, S. A., Dec. 16, '95, states the death of Mark Elliott, of Santa Rosa, at Mashonaland, of Asiatic fever. Mr. Elliott was a mining engineer who left this State three years ago to engage in mining. The letter is doubtless a forgery, for Mr. Elliott has been heard from since the date of the communication, and had anything happened him his South African friends would have wired.

## Dividends Declared This Week.

The Homestake Mining Company has declared a monthly dividend of 25 cents per share.

The Highland Mining Company of South Dakota has declared a dividend of 25 cents per share, or $25,000, payable since the 20th.

The Ontario Mining Company of Utah has declared a dividend of 10 cents per share, $15,000 payable January 31st; the first since October, 1892, when a 50-cent dividend was declared.

The trustees of the Boston and Montana Consolidated Copper and Silver Mining Company have declared a dividend of $2 a share, payable February 20th, to stockholders of record at the close of business January 21st. This makes the total dividend to date $3,725,000.

## Commercial Paragraphs.

A Rand compressor and complete drill plant has been sent up by H. D. Morris & Co., 141-143 First street, this city, to the Sierra Buttes Mining Company's Mammoth mine, Tuolumne county.

The Colorado Iron Works has finished the machinery for Taylor Brothers' concentration mill at Russell Gulch, Colorado. This mill will treat the low-grade ore of the Saratoga mine, and has a daily capacity of fifty to seventy-five tons.

The Standard Boiler Co. of Chicago has moved into its new offices, 1120 and 1121 Marquette building. These boilers are built by the Link-Belt Machine Co. of Chicago, who have put in new and improved machinery for their manufacture, reducing the prime cost, as well as making the various parts interchangeable. During the past year a number of fine plants have been installed, among others being 4000 H. P. for the North Chicago Street Railroad Co. at their new power station at Hawthorn avenue; 500 H. P. for the Cincinnati-Edison Co. at Cincinnati, O.; 600 H. P. for the Western Electric Co. at their factory in Chicago, and various others.

## Mining Incorporations This Week.

The Goodtitle Consolidated Mining Company; principal place of business, Nevada City; directors, John J. Dailey, Dobbins Ranch, Yuba county; J. E. Poingdestre, L. M. Hancock, Nevada City; W. Raley, San Jose; W. Meredith, San Francisco; capital stock, $60,000. The Goodtitle mine is near Dobbins Ranch, in Yuba county.

The Mayflower Gold Mining Company has incorporated here; capital stock, $3,000,000, all subscribed by the directors, as follows: Alvinza Hayward, $1,050,000; C. D. Lane, $1,050,000; C. A. Davis, $300,000; C. W. E. Shepman, $300,000; T. M. Lane, $300,000. The principal purpose of the corporation is to develop the Mayflower mine in Nevada county.

SAVE MONEY BY USING

## THE "DANIEL BEST" CRUDE OIL ENGINE

FOR POWER.

THIS IS WHAT THEY CAN DO:

**Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines,** using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

| | |
|---|---|
| Coal Gas, ten hours' run, 1000 feet | $2 00 |
| Gasoline (74 deg.), ten hours' run, 8½ gallons @ 14c | 1 25 |
| Coal Oil, ten hours' run, 7½ gallons @ 10c | 75 |
| Crude Petroleum, asphaltum base, 16 gallons @ 3c | 48 |
| Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c | 65 |

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon=21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

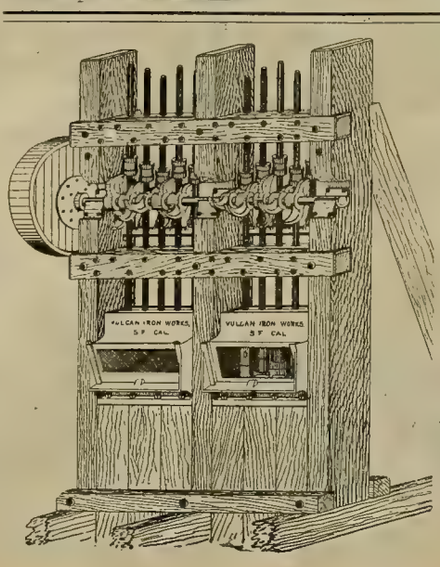
IMPROVED PORTABLE HOISTING ENGINES.

**Improved Self-Contained Three or Five Stamp Mill,**

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.



SECOND: The saving in millwright and mechanics' labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight.

**Send for Circulars and Price List.**

## The Pelton System of Power

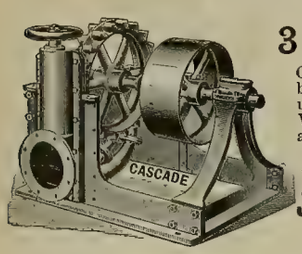
Represents the highest development yet attained in water wheel practice and affords the most simple, efficient and economical means of utilizing water for power purposes.

## Six Thousand Wheels Now Running,

Aggregating over 400,000 horse power. Adaptation made to all conditions and every variety of service.

## Electric Power Transmission.

PELTON WHEELS are the recognized standard for electrical work and are running a majority of the stations of this character in all parts of the world.



Catalogues furnished upon application. Address

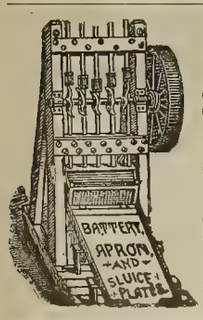
THE PELTON WATER WHEEL CO.,

121 MAIN STREET, SAN FRANCISCO, CAL.

## TURBINE AND CASCADE WATER WHEEL

*Adapted to all Heads from*

### 3 Feet to 2000 Feet.



Our experience of 33 YEARS building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.

# Market Reports.

## The Markets.

SAN FRANCISCO, Jan. 23, 1896.

Silver is steady. Of the metal market little new can be said. The outlook has more encouragement in it than in the first weeks of the year, and general activity is predicted.

In his annual trade review of the industries of Pittsburg, Jos. D. Weeks, treating of manufactured iron and steel, says:

Regarding the prices of manufactured iron and steel in 1895, it may be said that, while there have been some decided changes during the past year, the jumps have not been as great as those recorded in other lines. Merchant bar iron for the first four months of the year continued at $1.10@1.15, but in the early summer began to advance. By September 1st the prices quoted were $1.45@1.50, and the highest figures shown were $1.55. In the early fall the reaction came, and the year closed with $1.35@1.40 as the quotations. Structural material made the best showing of the market during the year. Beams and channels which were quoted at $1.25@1.30 at the beginning of the year went down to $1.20, then began to go upward. By June the quotations were $1.33@1.40, and the rise continued until August, when the highest figures of the year—$1.60@1.70—were recorded. But in the last quarter the demand fell off and prices slid downward, closing the record of the year at $1.50@1.55. The sheet-iron trade during the year has shown similar features. Thus No. 24 sheet began the year at $2.25@2.35, dropped as low as $2.05, and then with other branches started upward. The highest prices—$2.50@2.60—were quoted in August, and with a slight change held on for several months. Prices weakened later, but not to the extent shown in other lines, and the closing rates were $2.45@2.50. The demand for plate and tank material during the latter half of the year was extraordinary. In January the prices quoted were $1.15@1.20, and lower values were recorded. Through July, August and September the rise in prices was very rapid. The highest figures were reached in September, when quotations stood at $1.85@2.05. The demand then began to fall off, and the last quotations of the year for plate and tank stood at $1.45@1.50.

Under date of Jan. 2nd, Jas. Lewis & Son, of Liverpool, England, write regarding copper: To-day's closing value is £41 6s 3d for cash (after a fall to £41 3s 9d) and £41 13s 9d for three months. For English refined and manufactured copper the cousumptive demand continues very good, India being a buyer of the latter. The gradual fall in the New York quotation of lake copper from 10.875 to 10 cents per pound, with free offerings on the Continent at the equivalent of the latter price, was the chief cause of the decline in values here. A sale of 5000 to 6000 tons at 10 cents, by the Calumet and Hecla Company to American consumers on the 30th ult. for delivery over the first three months of this year, their previous sale in September having been at 12 cents, has however had a steadying effect on our market, as our company will now have but a limited quantity for sale here and on the Continent. As some of the leading American producers have had a conference to decide upon a definite policy to arrest the decline in values, and the Calumet and Hecla Company have announced their intention to reduce their monthly output after the 1st inst. to their normal monthly quantity of about 2800 tons (2000 pounds), against an average of about 4300 tons during October and November, it is probable that we shall see a considerable reduction in the total American production during the next three or four months. Should this take place, in view of the present large reduction in public and private stocks as compared with what they were twelve months ago, and the large consumption of England and the Continent, we shall probably, ere long, see an improvement in prices. Eleven cents per pound for an output of 40,000 tons per annum would prove considerably more profitable to the Anaconda company than 10 cents on 50,000 tons.

Gold, 77s 9d per oz. standard. Silver fell from 30⅝d to 30d on the 12th ult., advanced to 30⅝d on the 30th, and to-day's quotation is 30½d per oz. standard. Quicksilver from second hands is quoted at £7 4s per bottle. Sulphate of copper is firm at £15 12s 6d to £15 15s per ton. Lead, £11 8s 9d per ton for English; soft Spanish, £11 5s to £11 6s 3d; rich in silver, £11 7s 6d to £11 10s per ton; ore of 70 per cent, £4 15s per ton and fine silver value. Antimony quiet at £30 to £30 10s per ton. Nickel offers at 1s 1d to 1s 2d per lb net. Tin advanced to £63 on the 5th ult., declined to £61 10s on the 11th, recovered to £62 5s on the 13th, and closes at £58 17s 6d, a total fall of £4 per ton during the month.

J. W. Harrison's coal report says: During the week there have been eight arrivals from the coast mines, with 15,379 tons of coal, from Glasgow 1760 tons, from Australia 2400 tons. These arrivals only aggregate about half of our actual consumption, yet there is no visible scarcity of fuel of any grade. Of Swansea anthracite there is a larger quantity in yard than at any period of last year. The recent stormy weather has materially diminished the stocks of domestic coals, insomuch that the dealers take immediate delivery from ship's sides of all British Columbia cargoes now arriving. The general rainfall throughout the interior is certain to induce shipowners to become liberal shippers of coal cargoes in the near future, anticipating an abundant harvest this season. It is true that so far as we are wanting twenty-five per cent of our annual average of rain up to date, still this last storm has been most propitious. The list of coal carriers is decreasing from Swansea and Australia. Latterly there have been over two arrivals here for each new name added there. The last engagement from Swansea was made at 14s. This shows no decline. From Australia rates are merely nominal, but few charters are being made.

## Mining Share Market.

SAN FRANCISCO, Jan. 23, 1896.

The past week under review has been uneventful. Prices shaded off slightly for the Comstocks, then stiffened just enough to encourage hangers-on, but not enough to let others come in as buyers. The market had hardly exhibited a strengthening tone before the bears began to come in, and, under their selling, values weakened again only to pick up under a better demand for Savage. The improved tone in these shares was somewhat of a surprise, yet it has not been, up to this writing, of sufficient moment to induce traders to come in. Operators have been so terribly hurt on the bull side that it will take something more than street points and a sickly movement to bring them in as buyers. Those who do enter are easily satisfied, for when the slightest opportunity presents itself to make a turn it is taken advantage of, but these opportunities have, for some time past, been as scarce as hens' teeth. A person to get them must be very quick, and not hesitate in selling or else the opportunity is lost. The way the market has been handled—if it can be dignified by calling it such—is enough to disgust the most chronic dealer. Notwithstanding the way in which it works, still there are persons who have confidence that a deal is on foot. While these persons believe that we will witness better prices before long, yet they do not look for anything very good. They state that conditions are not such as to expect more than a fair-sized move on the bull side. They contend that one or more outside combinations have good lines of shares on which they are in the hopes of realizing profit by creating the belief that a spring deal is at hand. It may be that they may be rewarded this time and get a large proportion of their holdings out on the more credulous. Heavy disbursements of money are being made, and it is only reasonable to conclude that some of the money can be transferred to their pockets. It is a well-known fact that work in some of the mines is to be pushed, with the expectation that it may result in striking more ore than has as yet been found, when, by methods but too well known to manipulators, the find can be enlarged and put out through the papers and also through cappers on the street in such a way as to attract gudgeons. Occidental has been the most active the past week, but if signs do not fail it looks very much as if the best prices have been seen, for a while at any rate, and that they are working down.

From the Comstock mines the news received the past week is not calculated to inspire confidence or excite buyers who operate on surface reports, but the better informed miners see, or seem to see, much in the reports to encourage them in the belief that better things can be looked for before the spring months pass. In the Alta group the work under way is essentially unchanged, and probably will not be until the assessment on Alta has performed its purpose of causing holders to unload so as to save the ten cents assessment. Why this stock has been so fearfully abused is an enigma and cannot be satisfactory solved except on the theory that there is too much stock out on the public. In the Gold Hill group the work under way should attract more interest, for there is an almost certainty that something of importance will be run into before the end of next month. Of course this assertion is made on the supposition that the powers that be will not stop the work or turn it aside, as was done last year when there was a dispute over the spoils. It is the division of spoils that has worked more injury than all else, in the absence of moneyed men not being in the market. When the latter come in openly, nothing is allowed to interfere with their projects as they are amply able to handle the market in any direction they wish. The skeleton official letters given from these mines are far from satisfactory to outsiders, yet the very disastrous run and direction given, are to the better informed, inspirers of confidence. In the middle group considerable ore is being raised each week, but this very fact with prices ruling low is far from creating faith that things are correctly given. It is argued that with the quantity of ore raised shares should command more money. Probably the reason they do not is due to the fact that the mine managers have very little, if any, faith that the ore will hold out. It would be singular, and yet it should not, if a good body of ore was run into. The Comstock lode has been prolific in surprises, and, as history is said to repeat itself, there is no reason why the Comstock should not also. Some good work is under way in the middle group. In the north ends Con. Virginia continues the attraction. The work in this mine always creates interest owing to its record of always coming to the front when least expected, and it is not at all unlikely but it will again, and perhaps within the next sixty days. Operators, though, look for the shares to sell for less money. The levels on which work is being done ought to show well later on. In Ophir and Mexican the work is attracting attention, but from all the writer can see from official letters it is most too soon to expect much for awhile at any rate. That ore will be found can be confidently asserted, but when is another thing. From Union and Sierra Nevada there is nothing new reported, and nothing expected, for awhile, as the work is too slow.

From the Brunswick lode more or less colored reports through private channels are at hand, yet the public does not bite, which must be quite tiresome to one or two persons who are said to be well loaded up with stocks. While saying this it must be admitted that the work is being pushed with more or less vigor, and if the lode is as good as some assert, it ought to be soon showing up something of value. When ore is found it will take considerable time and money to get it in working condition.

From the Bodie district there is nothing new to report. They are still scratching around on levels from which nothing can be expected to benefit shareholders. In Bodie they ought to go deeper, but this will cost money.

The following illustrates the changes of the week:

| Mines. | Jan. 16. | Jan. 23. |

## One Day's Mining Incorporations.

The following named mining companies filed articles of incorporation last Saturday with the Colorado Secretary of State:

The Idaho Placer Mining Company; capital stock, $500,000; to operate in Washington county, Idaho, Malheur and Baker counties, Oregon. offices at Denver; J. D. Parker, J. L. McKeever, W. L. Morrell.

The Whiting Gold Mining Company; capital stock, $1,000,000; Arapahoe and Gilpin counties. offices at Denver. W. J. Barker, E. L. Halleck, T. L. Cathcart.

The Cripple Creek and Clear Creek Mining Company, capital stock, $1,000,000; El Paso and Clear Creek counties. offices at Denver; J. E. Benjamin, W. H. Chittenden, G. G. Newcomb, F. W. Schenk.

The Assayers Gold Mining and Milling Company; capital stock, $1,500,000; Arapahoe and El Paso counties; offices at Denver; E. F. Perry, H. W. Cotton, F. Webb, D. E. Wheeler.

The Bonita Gold Mining and Milling Company; capital stock, $1,000,000; El Paso county; offices at Colorado Springs; E. M. Blair, O. Messinger, J. W. Tibbitts.

The Mound City Gold Mining Company; capital stock, $2,000,000; El Paso county; offices at Colorado Springs; H. McAllister, Jr., H. M. Blackner, J. L. Arnit.

The Argus Gold Mining Company; capital stock, $1,500,000; El Paso and Douglas counties; offices at Colorado Springs; R. A. Christy, C. A. Howard, H. R. Smith.

The Old Gold Mining Company; capital stock, $1,500,000; Arapahoe, El Paso and Fremont counties. offices at Denver; J. M. Downing, E. T. Jones, H. K. Chittenden.

The Cripple Creek and Park County Gold Mining Company; capital stock, $1,000,000; El Paso and Park counties; offices at Denver; R. E. Perry, G. A. Wright, W. B. Chapman, E. F. Witbeck, A. Chapman, J. W. Fredrum, W. P. Garrison.

The Venado Mining Company; capital stock, $1,000,000; El Paso and Arapahoe counties; offices at Denver; H. A. McCrary, C. D. Parker, D. J. Haff, R. E. Shryock, A. Van Valkenburg.

The Herald Gold Mining and Milling Company; capital stock, $1,000,000; Arapahoe, Fremont and El Paso counties; offices at Denver and Chicago; H. C. Charpiot, L. R. Hubbard, M. Storrens.

The New York and Cripple Creek Gold Mining Company; capital stock, $1,500,000; El Paso county; offices in New York and Cripple Creek; J. Becker, S. B. Dickens, I. G. Gregg.

The Sterling Gold Mining Company; capital stock, $1,000,000; El Paso and Fremont counties; offices at Colorado Springs; E. K. Carnes, V. L. Evans. J. H. Fullerton.

The Cripple Creek and Chicago Mining and Milling Company; capital stock, $2,000,000; El Paso and Fremont counties; offices at Victor; A. Goodrich, H. C. Lloyd, T. H. Ball.

The Honduras. Mining, Milling and Development Company; capital stock, $1,500,000; Fremont county; offices at Anaconda; S. M. Bell, L. M. Philbrick, Morris Lehman.

The Denver *Republican*, from which the above is condensed, does not state the amount of capital stock paid up in each instance.

**The Explorers' and Assayers' Companion.**

**A Third Edition of Selected Portions of the "Explorers', Miners' and Metallurgists' Companion."**

By J. S. PHILLIPS, M. E.

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and discriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Price $5.00 postpaid. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

## Assessment Notices.

JUSTICE MINING COMPANY. Location of principal place of business, San Francisco, California. location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 14th day of January, 1896, an assessment (No. 6) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 328 Montgomery street, Room 23, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of February, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 9th day of March, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. E. KELLY, Secretary.

Office—No. 328 Montgomery street, Room 23, San Francisco, California.

---

ALTA SILVER MINING COMPANY. Location of principal place of business, San Francisco, California. location of works, Gold Hill, Gold Hill Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of January, 1896, an assessment (No. 51) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of February, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 9th day of March, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. E. JACOBUS, Secretary.

Office Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

---

SAVAGE MINING COMPANY.—Location of principal place of business, San Francisco, California. location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the fourth (4th) day of January, 1896, an assessment (No. 88) of twenty cents (20c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 50, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the sixth (6th) day of February, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 26th day of February, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. B. HOLMES, Secretary.

Office—Room 50, Nevada Block, No. 309 Montgomery street, San Francisco, California.

---

WEST SIDE CANAL AND LAND COMPANY.—Location of principal place of business, San Francisco, California. Location of Works, Fresno and Kings counties, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 30th day of December, 1895, an assessment (No. 3) of one (1c) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 8, Floor 8, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of February, 1896, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on THURSDAY, the 27th day of February, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. E. NAYLOR, Secretary.

Office, Room 8, Floor 8, Mills Building, San Francisco, California.

---

ANCHOR COAL AND DEVELOPMENT COMPANY.—Location of principal place of business, San Francisco, California. Location of Works, Kelso, Cowlitz county, Washington.

Notice is hereby given, that at a meeting of the Board of Directors held on the second (2d) day of January, 1896, an assessment (No. 6) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 632 Market street, Room 5, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the third (3d) day of February, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 6th (6th) day of March, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. D. FARISH, Secretary.

Office, No. 632 Market street, Room 5, San Francisco, California.

## Hallidie Ropeway at Halls Mines, Nelson, B. C.

A Hallidie wire ropeway has just been finished on the Silver King mine, belonging to the Halls Mines Company, an English corporation, in the Kootenay district, British Columbia. It was constructed by the California Wire Works under Mr. A. S. Hallidie's patents, and all the material for the same was supplied from San Francisco. The ropeway passes over a very rugged country in that mountainous district, and is remarkable for the great length of the line and the difference in the elevation of the two ends. Over 50,000 feet of special steel cable was used, and the distance between the two ends is 23,797 feet—a trifle over four and one-half miles—and in that distance there is a fall of 4100 feet. Snow falls heavily at the upper end, sometimes attaining a depth of sixteen feet, and at times the wind blows at the rate of seventy miles per hour and the cold is intense. Throughout the entire length of the ropeway the timber, which is very dense, was cleared off to the width of 200 feet. The ropeway is a continuous moving rope which measures in place 47,900 feet, and has attached to it 900 ore conveyors which are rectangular in shape, contain 100 pounds of ore each and are self-dumping. The steel rope is made from special material, specified by Mr. Hallidie for the purpose, and passes at each end around patent grip pulleys, ten feet in diameter, to which are attached strong brakes, to control the speed of same. Between the two ends, and located at suitable points, are 126 intermediate supports or stations, having projecting arms with sheaves on which the steel rope rests. The ore conveyors are attached to the steel rope by peculiarly designed clips, which are so shaped and fitted as to pass over the station sheaves and the end grip pulleys. The steel rope runs at a speed of three feet per second, and delivers ten tons of ore per hour. The ore dumps at the mine hold 8000 tons of ore, which contains forty ounces silver and five per cent copper. About 2500 tons have already been transported from the upper to the lower ore bins by this ropeway, and the ore is ready for the smelter which is about completed.

FIG. 1.—ORE BINS AT LOADING STATION, UPPER END OF ROPEWAY, SILVER KING MINE, KOOTENAY, B. C.

Work was commenced on the ropeway last July and progressed well until a forest fire swept through the timber in September and delayed the work very much. A great deal of damage was done and some of the great coils of steel rope were en route to the top of the mountain in the line of the fire. With great forethought the engineer in charge, Mr. E. I. Parsons, had these coils buried in the ground and the fire passed over them.

We show some views of this line, which are reproduced from photographs. Fig. 1 illustrates the ore bins at the mine, and was taken before they were roofed in. The square log structure encloses the upper works and loading station of the ropeway. Fig. 2 shows the interior of the loading station, in which are seen the grip pulley, ten feet in diameter, around which the steel rope, one and one-sixteenth inch in diameter, lays in the grips, also the rope sheave and one ore conveyor, No. 318. Two steel bands, 4½x¼, work on seven-foot brake wheels controlled by hand wheels. Mr. E. I. Parsons, the engineer, is in the foreground and gives a good comparison for dimensions. Fig. 3 is station No. 1, and other stations are seen in the distance. Fig. 4 (on page 85) has station No. 54 in the foreground; this station is eighty feet high. The station on the crest of the hill is three-quarters of a mile distant. The clearing in the woods is 200 feet wide. Fig. 5 (on page 85) shows the lower terminal frame of the ropeway, grip pulley and the ore bins which hold 10,000 tons of ore. From station No. 1 to the lower terminal there is a descent of 4100 feet, and the line of the ropeway passes over several divides and across several valleys.

The California Wire Works has constructed five other Hallidie ropeways the past summer, but this one is the longest unbroken line built under the Hallidie system. The cost of conveying the ore the distance of four and one-half miles will be from 30 cents to 35 cents per ton, and sufficient power is developed by the descending load to convey back free of cost all the usual supplies of such a mine.

FIG. 2.—GRIP PULLEY AND UPPER WORKS OF ROPEWAY, SILVER KING MINE, KOOTENAY, B. C.

FIG. 3.—INTERMEDIATE STATIONS AT THE UPPER END OF ROPEWAY, SILVER KING MINE, KOOTENAY, B. C.

THE series of articles on "Mines, Miners and Monopolies," now appearing in this paper, is of present point and value. In No. 3, in this issue, Mr. Edman directs attention to the language of Commissioner Lamoureux regarding the need of examination and survey before that official allowed himself to be subjected to certain influences not conducive to a judicial aspect of the case.

SOME time ago *Printers' Ink*, the best authority on advertising in the United States, sent an unsolicited statement to the MINING AND SCIENTIFIC PRESS that this paper had the largest circulation of any paper devoted to mining in the State. It is believed that with one exception it has the largest circulation of any mining paper in the United States. Subsequently *Printers' Ink* sent a similar unsolicited statement relative to electrical matters. More recently the same eminent authority on the science and art of advertising says "character advertising pays the investor best. It is not the extent of the circulation of the paper, but the class of people who read it. Class journals reach a particular set of individuals. If it is a mining and scientific publication its circulation must necessarily be among that class of readers who are engaged in mining and kindred occupations. Advertisers have begun to realize that quality and quantity are co-existent in a good medium; and that a few who are probable buyers are better than the multitude who are not. Any sensible man knows that one gold pin is worth twenty brass ones, but it is only recently that the bulk of advertisers have come to appreciate the same idea as applied to newspaper circulation." All of which is so. It will be observed that while no amount of money proffered the proprietors of *Printers' Ink* would induce them to make any statement not supported by truth, yet the MINING AND SCIENTIFIC PRESS has succeeded in securing from the best authority on advertising in the country three unsolicited testimonials as to its value as an advertising medium. There must be some reason for that. There can be but one real reason, viz., recognition and statement of an unanswerable fact.

CONFLICTING claims regarding the efficiency and cost of acetylene, the new illuminant, lend present interest to the illustrated article on page 87, descriptive of the first plant in the world, just built to manufacture the article on a large commercial scale. Whatever the merits or the ultimate result of the controversy, there is manifestly sufficient practical value in the idea to justify the notice accorded it in former issues and the present number of this journal.

## Proposed Change in the United States Mining Laws.

A committee of the Miners' Association, of which John Hays Hammond and Ross E. Browne were members four years ago, drafted a bill making radical changes in the manner of locating and holding mining claims. The bill was introduced into Congress, but seems to have got no further. The time seems opportune to have it reintroduced, possibly with some changes, as it would not only be as desirable and effective as it then seemed, but has an added value from the assistance it would give to the solution of the railroad mineral land question. To recall the matter to our readers, the bill proposed is, in effect, that a mining claim should be located and claimed by means of a procedure requiring the survey of the claim by a United States mineral district surveyor, at the charge of a Government mineral survey fund formed by the payment of some fixed amount by the mine claimant on making his request to be allotted the claim. His claim surveyed, not appearing in conflict with any allotted claim, it would be allotted to him and his possession would thereafter be maintained by an annual rental to the United States. These rental payments would take the place of the present annual requirement of assessment work. A failure to pay the rental would render the claim forfeit, and it could then be resurveyed and allotted to other parties. The advantages to the mining industry of the proposed law are many. Definiteness to claims would be given by the official record of the surveys; conflicts of locations and the litigation incident to such conflicts would be very largely avoided; there would be no uncertainty as to when a claim became forfeit and open to relocation; records of possession would be much simplified; comparatively little of the existing practice of tying up large areas from exploration by paper locations would be done, the claims representing actual developments of mineral value to a much greater extent than at present. In the matter of the mineral land controversy with the land grant railroads it would be of vast assistance to the miners. The actual allotments of mining claims on the odd sections would withdraw them from being claimed by the railroad, and the maps would be a record from which reasonable deductions could be made as to possible or probable mineral deposits in adjacent odd sections not allotted to mining claims. In short, the areas of odd sections which would have to be examined by commissions to determine as to mineral character would be very much smaller than at present, and the examination required would be exclusively expert, geological and mineralogical. For this last purpose, how is it that the Interior Department fails or neglects to use the evidence of mineral character it has itself collected by the geological survey, in passing on the lists of odd sections? Is it not the object of the geological survey to determine this very fact? And if for the public, why not for the Interior Department? The geological survey has been completed, and many of the sheets published, covering the railroad odd sections in Sierra, Nevada, Yuba, Butte, Placer and El Dorado counties. Not only have all old and existing mining developments been noted by this survey and platted on the maps, but the geological evidence of undeveloped mineral deposits has been collected and platted. This is particularly the case with the old river channels, the deep lava-covered auriferous gravels. The Interior Department has rejected specific protests on odd sections that their own surveys, maps and geological experts designate as conclusively mineral. This suggestion is commended to the attention of the Mineral Lands Committee of the Miners' Association.

COLORADO PAPERS editorially anticipate a "rush" of miners to that State this year as great as the stampede to California forty-six years ago, and point to the present gathering of newspaper correspondents at Cripple Creek as indicative of the coming numbers. There is considerable present activity there and the probabilities are it will continue for some time, but the likelihood of an enormous impetus to mining operations is not confined to Colorado or a little section of that State. The profits of gold mining, as compared with the losses of other business enterprises, impel men everywhere to turn to an industry the product of which brings forty per cent more than it did thirty years ago, while it can be produced at forty per cent less cost; but it is probable that in California will be seen the greatest activity in this direction. It is not an influx of miners, of men with pick and shovel, that is of most probable value, and any journal that looks for a repetition of "the days of '49" here or in Colorado, or anywhere else, will be mistaken. It is not men, but money, that will be the mainspring of the coming activity in gold mining. The days of "ounce diggings" and weekly individual clean-ups on the scale they formerly existed are gone forever. In rich gold fields like California there will of course be room and opportunity for the next half century for the individual miner, but the business of gold mining here or anywhere else is now and will be purely a matter of judgment, of scientific knowledge, intelligent working and judicious investment. Gold mining has become primarily a matter of management and economy and has got down, or up, to the level of all other business. It is the influx of capital, not men, that will be the measure of mining activity in the future. In this regard California can complacently congratulate itself; for, while not unmindful of the great gold wealth of her sister States, it is believed that, as in the past, when the annual gold output is recorded, it will be found that superior conditions will continue its preeminence. There may be more ephemeral activity elsewhere in the organization of mining corporations with one hundred thousand dollars capital stock to one dollar paid in, but that has no more to do with the legitimate business of extracting gold from the ground than the antics of the Chicago bear-pit have with harvesting the wheat.

## The New Photography.

San Francisco newspapers this week have press dispatches and illustrated articles descriptive of the new photography which pictures the bones through flesh and clothes, and practically penetrates all things usually deemed opaque. According to Prof. Rontgen, a German scientist and the alleged discoverer of this new art, coins in closed purses, iron discs in heavy closed wooden boxes, skeletons of living human beings enveloped in customary clothes, etc., are all distinctly and correctly portrayed, the things inside and not the outer coverings being depicted. Prof. Rontgen says he has accomplished this by "radiant heat," and from his description of the process evidently believes he is trending upon a possible discovery of the famous "fourth dimension," the dream of so many. Prof. Rontgen, at Wurzburg, uses a Crooke's tube and an induction coil. In some ways his published statements do not differ materially from accounts of the success achieved on similar lines by Fernando Sanford, at Leland Stanford Jr. University at Palo Alto, in this State, published herein nearly three years ago. Prof. Sanford secured photographic representation of sundry objects, though opaque substances intervened between the camera and the object photographed. He attributed the phenomenon to a form of electric energy known as the "Hertzian wave," so named from H. Hertz of Bonn University, the original producer of this form of sympathetic vibration. Prof. Rontgen uses no lens, as the result of his experiments announces that the "new light" which he utilizes in such extraordinary photography does not travel in waves but in straight lines, and cannot be refracted. At Vienna and Buda-Pesth scientific investigation is reported to have concurred in the success of Prof. Rontgen's experiments and the correctness of his conclusions.

From the standpoint of the practical miner, this scientific "discovery" is of double value, for it is gravely alleged that this "new light" or "radiant heat" is different in some important respects from ordinary light. It is stated that such material as earth, stone or copper is by this new light as transparent as glass to ordinary light, and that the quality of being opaque which has through the ages been so annoying and expensive to the miner will now disappear; that by reason of Prof. Rontgen's discovery the California prospector or miner can see into the dark breast of the drift or look below the surface with as much ease as though dyke rock, hanging wall, footwall, fault, dip, slip or other subterranean question of procedure were plate glass, and can see the gold many feet below or beyond ordinary mortal sight, which can rarely see much farther than the point of the pick.

In matters of faith or matters of fact it is so much easier to believe than to doubt or deny that in the case of this "new light" debate can be deferred pending further investigation. Still it is probable that any present arrangement looking to the development of California gold mines will not be seriously modified or affected by this latest and greatest "discovery."

## Concentrates.

THE Carley mine at Murphys, Cal., is reported closed down.

THREE smelters are now in operation in southern Kootenay with a daily product of $10,000

COLORADO SPRINGS, Colorado, talks of organizing a mining stock exchange "for ladies only."

DURING 1895 Great Britain shipped mining machinery to the value of $720,855, mostly to South Africa.

THE old, reliable Homestake paid its 210th dividend in this city and New York last Monday, making a total of $5,748,000.

COL. DORSEY and J. T. Newcomer are building two stamp mills on the Dorsey and Sublet properties, near Collierville, Cal.

THE Frenchoption on the Champion mine, Nevada Co., expired yesterday. It is understood that it will not be renewed

JOS LAWRENCE of this city is now operating a ten-stamp mill which he recently erected on his mine near Lotus, El Dorado Co.

THE Hope, Montana, mine has two superintendents—Messrs. Balch and Fletcher which makes matters a little awkward for all concerned.

FREE gold is now reported found in the Mercur, Utah, ore, which, if so, will increase the interest now taken in that singular formation.

THE *Free Press* estimates the population of Redding at 4000, and thinks that one thousand persons have been added during the past four months.

THE Ontario, Utah, silver mine paid yesterday a 10-cent per share dividend, amounting to $15,000. Dividend-paying silver mines are very scarce just now.

THE San Francisco Stock and Exchange Board has relisted the Mayflower Gravel Mining Company shares and listed the Eureka Drift Mining Company shares.

THE Morning Star Gravel Mining Company, Placer Co., last Monday declared dividend No. 62 of $5 per share. The mine is looking well and promises to pay many more such dividends.

ASSAYER AUBREY of San Diego, by a recent analysis of dump iron sulphurets from Banner, 60 miles eastward, has aroused hopes that the waste in that district can be profitably worked.

A 10 CENT dividend was paid by the Alaska-Mexican Mining Co. on the 28th ult. When the sixty new stamps now being erected begin operations it is thought the dividends will be increased.

S. S. MOSER has agreed to sell the Moser Co. gravel mines, Mokelumne Hill, Calaveras county, to the Roanoke Mining Co., for $20,943.20, on the installment plan at the rate of $150 per month.

IN parts of Plumas county the total precipitation during the recent storm approximated 30 inches. The rain and snowfall in the foothills and high Sierras afford abundant supply for mining operations.

THE Le Roi Mining and Smelting Company has declared a dividend of $50,000, payable to-day—10 cents a share on the capital stock of the company, 500,000 shares. This makes $75,000 paid within the past few months.

SAYS the Placer *Argus*: "Our people should never forget the merchants of San Francisco, for they have always contributed liberally to the mining cause. They are with us on the hydraulic and every other mining question."

A SNOWSLIDE last Saturday carried away the mill at the Vanderbilt mine, two miles south of Hailey, Idaho. G. Hague was caught in it and killed; the blacksmith was also caught but was rescued in time to save his life.

"BUY 'em on the slumps and sell 'em on the jumps" is the reputed motto of the Colorado Springs Mining Stock Exchange, paraphrasing the famous Daniel Drew motto of "buy when they are cheap and sell when they are dear."

TWELVE years ago Moody's Farm, the present site of Johannesburg, South Africa, was offered to Baron Grant for $250,000. His expert made an adverse report and that settled it. The same ground is now held at a thousand million dollars.

THE extent of the present fever for mining exchanges is illustrated by the simultaneous opening this week in Laramie, Wyoming, and Philadelphia, Pa., two places as widely dissimilar in every respect as it is possible in this nation to be.

A. W. STOTT is suing E. Gilman et al., in Butte Co., for $46,000, alleged to be due him for his services as a "middleman" in selling a mine for them in Mexico. The defendants admit that he made the sale, but think he wants too big a slice.

W. T. PHIPPS, manager of the State Anti-Debris Association, will file a protest against the application of Spaulding and Phelps to be allowed to impound tailings in Bear river at Dutch Flat. Those gentlemen propose to widen and raise the Old Liberty Hill dam.

THE Alaska Treadwell Mining Company paid a quarterly dividend of 37½c per share, amounting to $75,000, on the 28th; the Gold and Globe Hill Company, of Cripple Creek, Col., of 2c per share on the 4th; the Gold Coin mines of Cripple Creek, Col., 1½ per cent on the 30th.

THE Hexter Gold Mining Company incorporated in this city this week with a capital stock of $30,000,000. The stock subscribed for amounts to $1,050,000, as follows: F. W. Page, $250,000; A. B. Moulder, $250,000; J. M. Duke, $250,000; C. T. Hamilton, $250,000; E. C. Jennings, $50,000.

THE latest definition of a promoter is "one who sells nothing for something to a man who thinks he is getting something for nothing." That is tersely clever and often true, yet is not wholly fair, for many instances may be cited where the promoter was a very necessary factor in negotiating a sale.

AT Rocky Bar, Idaho, last week, a snowslide caught and carried down R. Brainard, a miner, down. Fifty men worked for two hours, after finding where he was, and got him out unhurt—the first instance on record in Idaho in which any one escaped after being buried in a snowslide, even a foot or two. Brainard was under six feet of snow.

FROM Havre, France, comes the statement that at Tancarville, near that seaport, are to be built reduction works, to which will be shipped by sailing vessel tailings from California gold mines, to be worked by a process in which "chloride of sulphur" figures largely. The further statement is vouchsafed that the aforesaid tailings go seven and eight ounces to the ton. The whole thing may be true, though it appears to lack certain elements of probability.

THE Executive Committee of the Northwestern Miners' Association has cut out a good deal of work for itself. At this week's meeting in Spokane, Wash., it was decided to promote in every way possible the mining interests of Washington, Oregon, Idaho, Montana and British Columbia, with representatives at Ottawa. In union is strength.

IN an article entitled "the wildest of wild cats," showing up a newly organized local "gold mining company," the Amador, Cal., *Republican* of current issue administers a just rebuke to the unscrupulous scheme. Mining papers throughout the State will do their localities the best service by exposing wherever practicable similar schemes.

THIS week the Consuelo Gold Mining and Milling Co. incorporated in this city, with a capital stock of $500,000, all subscribed, by C. Roberts, Geo. Stone, W. H. H. Hart, A. E. Bull and B. W. Scott. They have bought the Kentuck mine for $30,000, which they propose to reopen and thoroughly develop, putting in machinery sufficient to sink the shaft to a depth of 1700 feet.

SINCE the recent rains, it is a common thing to note in several mountain and foothill exchanges from nearly all parts of the State accounts of coarse gold and nuggets being picked up. Probably nothing better indicates the immense value and extent of this the greatest gold field on earth than that, after nearly half a century of continuous yield, surface gold is still brought to light by the washing of the rain.

LAST week the State Supreme Court hit a hard blow at the practice of electing "dummy" directors in a corporation by deciding in a case where the Rosecrans Mining Co. and H. S. Marey were in litigation, that the election of a non-stockholder as director is not legal. Now if something could be done with "tramp corporations," capital stock $10,000,000, paid up $5.75, much good would be resultant.

THE Pueblo, Colorado, *Chieftain* humorously says: "If lead is going to run down to much lower prices we might start a new industry with it in Colorado—the making of lead shingles. It makes an indestructible roofing, the only question being that of cost. A hundred pounds of lead, worth perhaps $2.65 or $2.70, ought to be made to cover a square of roof as well as $4 worth of wooden shingles."

GEN. TOLMAN, of Alameda, who sometime ago located and recorded claims 72,000 feet in length on the Sacramento and American rivers, has his novel boat, previously described, on the Sacramento near the mouth of the American, and expects to begin dredging as soon as the present flood subsides. He has a dredger, four amalgamators, a 30 H. P. gasoline engine, a crew of five men, and figures on substantial profits in gold and quicksilver.

CONFIRMING previous reports published herein, it is now stated that the purchase of 800 acres of land near Escondido, San Diego Co., Cal., by C. D. Chapman and H. C. Brown, of Colorado, is completed and a company formed to work the low grade ore. The new company talks of building a 200-stamp mill and working on an extensive scale. O. R. Smith of Santa Ana is reported as having bought the Jolly Boy mine, Escondido district, an almost undeveloped property, for $20,000.

COLUMNS of description appear regarding Utah and Nebraska deposits of pumice stone, their great extent and value, all of which is doubtless so. It is however stated that outside of those two States there is only one other pumice producing region—the island of Lipardi, off the Italian coast. This is not so. In Sonoma county, this State, is a pumice deposit, not at present actively worked, because of lack of demand, but capable of supplying local and general requirements.

THE London *Mining Journal* of Jan. 11th publishes the names, situation, number of shares and nominal capital of the mining companies registered in England in '95. In all there were 961; of these, 436 in New Zealand and Australia, with a nominal aggregate capital of $222,386,805; 338 in Africa, $230,437,425; 79 in Great Britain, $17,669,835; 50 in North America, $27,319,250; 25 in South America, $21,286,000; 20 in Europe, $8,497,500, and 13 in Asia, $8,349,390, a total nominal capital of $536,936,205.

IN the case of Stewart et al. vs. Rees et al., Spokane, Wash., Secretary of the Interior Smith this week decided that, under section 2332 R. S., possession of a mining claim with work thereon for a period equal to the time prescribed by the statute of limitations for mining claims in the State wherein such claim is situated, entitles the claimant to a patent thereto in the absence of any intervening adverse claim, even though it may appear that such claimant may have failed, through oversight, in making the requisite statutory expenditure thereon.

TALKING of rich ore, etc., B. S. Kimball, who has recently been at Baker City, Or., says: "I saw at the Virtue mine, which is owned by Grayson of San Francisco, a single slab of gold that had been reduced to bullion by nature herself, and which weighed in at $5,000. It required no handling, but was shipped direct to the mint at San Francisco, and was there registered as bullion. In two days and a half ore that yielded the owner $64,000 was taken out of the mine and shipped as high grade, while the mill every month affords a clean-up of $20,000."

ONE of the questions that seems necessary to answer again and again is regarding the extent of time a locator of a mining claim has to do the required annual assessment work to hold the claim. It is again stated that he has all the remaining part of the year in which the location was made and all the next year: that is, if our inquirer located a claim any time last year—1895—he has till Dec. 31st, 1896, to do the required $100 worth of work or improvement. Probably it would be better for himself and the claim, too, were the law less liberal in this regard, but that is a matter of opinion. The law is as stated.

TALKING of Colorado tellurides, State Geologist Rickard says: "The presence of tellurides is opposed to successful stamp-mill treatment, but cyanide solutions have power to dissolve them and the chlorination process appears capable of dealing with them after very careful roasting. These fortunate results are largely due, in the case of Cripple Creek ores, to the partial decomposition of the telluride into telluric oxide and free gold. In this case Nature has effected what otherwise would be the result obtained by a roasting process, such as frequently carried out by the miner who places a specimen in a blacksmith's fire in order to 'sweat out' the gold. This as a rough test is good enough for very rich specimens, but would prove ineffective for ore containing a telluride in minute quantities. To test such material a careful assayer is the man to go to."

ARTICLE 148 of the Transvaal, South Africa, law says: "Every person residing within the boundaries of a proclaimed field being guilty of rising, rebellion, or any unlawful resistance against the Government, or the lawful authority on the field, shall, over and above the punishment laid down in the law for such offense, forfeit to the State all his right and goods situated on the said field. The person or persons on whose information another person is convicted of one or other of the said offenses, shall be entitled to one-half of the value of the goods thus forfeited." In the unlikely event of the conviction of any resident American of having violated that law, his property would be subject to confiscation.

THE nickel mines at Sudbury, Ontario, raised 112,037 tons of ore last year, of which 87,916 tons were smelted. The ore contains a small percentage of nickel, however, so that the amount of nickel contained in this large quantity of ore was but 2,570 tons, which was accompanied by 2748 tons of copper and some three and one-half tons of cobalt. The cost of producing the nickel matte from the ore is heavy. It is crushed and then roasted, which gets rid of some of the sulphur. Smelting is effected in water-jacket furnaces, the charge containing eight tons of roasted ore to a ton of coke, the result being a matte containing 15 per cent of nickel. This matte is not usually refined in Canada, but is exported as it stands. The Vivians, however, bessemerize the matte, raising the contents to 40 per cent of nickel before exporting it to Swansea, Wales. Other processes of reduction are being experimented with, among them an electrolytic process, which is, however, handicapped by the tariff on the acids required.

IN accordance with the original policy outlined in the matter, another mineral land bill was introduced in Congress this week in lieu of the first one, so objectionable to many who had given the subject considerable thought. The new bill is framed along the lines of the Idaho-Montana bill, passed by Congress at its last session, and so far as applicable to California is almost identical with that measure. The bill introduced last Monday by Congressman Johnson is in the main the same as that published in this journal on page 402 of the issue of Dec. 21, '95. That bill provided for three commissioners. Last Monday's bill provides for the division of the State into four divisions, Redding and Susanville land districts in Division 1; Marysville and Sacramento districts in Division 2; Stockton and San Francisco districts in Division 3, and Visalia, Independence and Los Angeles districts in Division 4, and that for each division a board of three commissioners is to be appointed to examine and classify the lands under discussion. It is to be hoped that a united effort toward satisfactory legislation may result successfully. At best it will, under the circumstances, be extremely difficult to get any measure relative to California through both houses, especially when it carries a dollar of appropriation of public money.

THE Pueblo, Colorado, landoffice has made a decision in the matter of applications for patents in mining cases. In March, 1894, the M. J. T. lode owners posted notice of application for patent on their claim. The claim extends into the suburbs of Cripple Creek, and the notice was posted on one of the houses that was built on the claim and some 300 feet from the discovery shaft. P. J. Baron had located the Herman Strauss mine long prior to the location of the M. J. T., and the two claims conflicted. The owners of the Strauss did not know of the posting of the application for patent by the M. J. T. until the sixty days to adverse had expired, and they at once filed a protest against the M. J. T., and among the grounds of protest was the allegation that the notice was not posted on a conspicuous part of the claim; also that $500 worth of work was not done. After examination of the evidence the register and receiver have rejected the application of the M. J. T. lode application for patent upon the ground that the claimant for the M. J. T. lode mining claim had failed to comply with the mining laws in the matter of posting notice of application in a conspicuous place on the claim and for failure to perform $500 worth of work. Applicants for patent cannot be too careful in making a full compliance with the rules and regulations in applying for patents on mining claims.

PRESENT activity in the matter of gold extraction and processes therefor in South Africa is strikingly exemplified by the following from the *South African Mining Journal* of Dec. 21, '95. The fourteen specified are the report of but one week; they are applicants to the South African Chamber of Mines for patents: No. 902—Applicant, F. Hill: for a means for the treatment of ores and slimes of gold, silver and other metals; to be heard February 14, 1896. No. 1000—Applicant, A. Frank: for treatment for the forming of cyanide combinations; to be heard February 14, 1896. No. 994—Applicant, E. Andreoli: for an improvement in the electro-chemical method of the treatment of gold and other precious metals, more especially in the cathodes and anodes; to be heard February 21, 1896. No. 1009—Applicant, L. de Rigaud: for a new method of getting gold out of its ore; to be heard February 21, 1896. No. 909—Applicant, L. Ehrmann: for improvements in the extraction of gold from metallurgical solutions thereof; to be heard February 21, 1896. No. 918—Applicant, L. Ehrmann: for an improvement in the precipitation of gold by means of zinc; to be heard February 7, 1896. No. 986—Applicant, L. Berichte: for a new method to get gold out of ores; to be heard February 14, 1896. No. 1010—Applicant, H. A. de Neufville: for a process and apparatus for the extraction of gold and silver from quartz, and from other gold-containing and silver-containing materials; to be heard February 21, 1896. No. 1014—Applicants, C. Vautin and H. C. Sulman: for improvements in the extraction of metals from their quartz and in the apparatus for the same; to be heard February 28, 1896. No. 1017—Applicant, Vicomte de Lambilly: for a new method to procure formic salt of ammonium with regard to the production of cyanide-hydrogen acid and cyanides; to be heard March 6, 1896. No. 1012—Applicant, A. de C. Scott: improved operation and apparatus for the treatment of quartz and liquids containing gold and silver; to be heard March 6, 1896. No. 1011—Applicant, B. C. Hinman: process and apparatus for the extraction of gold from quartz and other gold-containing materials; to be heard March 6, 1896. No. 959—Applicant, J. Pfleger: improvements in the manufacture of cyanide; to be heard March 6, 1896. No. 1015—Applicant, M. Crawford: alteration in the precipitating or gaining of gold and other precious metals out of solutions which have been used to separate such metals from their ores.

## Mines, Miners and Monopolies.

Written by J. A. EDMAN.

NUMBER III.

By the act of 1866 the mineral lands of the public domain were declared open to exploration and occupation by all citizens, and by the subsequent acts of 1870 and 1872 (all afterwards included in the Revised Statutes of 1878) laws were passed providing for the occupation, entry and purchase of the mineral lands by actual miners. Even up to 1878 the railroad had made but few claims to the mineral land, and the present land-office definition of such land had not then obtained.

Meanwhile the operations of the hydraulic miners had caused serious injury to the agricultural lands of the Sacramento valley, and the agitation resulted which brought about the decree of 1879 and subsequent injunctions, and practical stoppage of hydraulic mining. What actual injury this was to the State need not here be discussed, but it became evident during the controversy that the railroad power was urging on and assisting the farmers with a view to keep up the animosity engendered and to prevent an equitable settlement of the question. From that day may be traced a conflict of interest and a split among the laboring elements of the State, so much more to be deplored as the contention was almost wholly artificial and uncalled for; but to this day it has been the means of making the people powerless against the common enemy.

From 1880 may be dated the constant and systematic encroachment on the mineral lands of California, chiefly as exemplified in the main gold belt.

From Kern county at its extreme southern end to Butte county on the north a strip of land in the foothills of the Sierras, averaging fifteen miles in width, has been invaded and largely occupied by agricultural claimants under the pre-emption and homestead laws, and the methods of acquisition are now too well known to need description here. Much of this land was old and abandoned mining ground, claimed by the agricultural locators to be useless for mining purposes, but even operating mines were sometimes included, when the prize was great enough to excite the cupidity of the would-be locator. It was during this period that the method of proving-off the mineral was perfected, which later has become the most potent instrument in the hands of the railroad companies. Meanwhile the Southern Pacific Company had been organized and obtained a land grant through the southern gold belt; it had absorbed and begun the wrecking of the Central Pacific Company, and had built the Oregon division of its line, along which it had also come into possession of a land grant penetrating the northern gold belt, which extends into Oregon.

During the period from 1880 to 1890 the wealth and political power of the Southern Pacific Company has constantly increased; it dictated by its corruption fund the municipal affairs of San Francisco; it had control of the State Legislature and the Railroad Commission, and exerted a strong influence in our State courts and the State land office. It virtually directed our internal and much of our interstate and foreign commerce by oppression, arbitrary and discriminating rates of fares and freights. In national politics it had gained a corresponding power by its secret combinations with other land-grant railroads and great banking corporations; it had gradually moulded to its purposes the rules and regulations of the General Land Office; it had placed ts friends in Congress and in lucrative positions in federal offices; it had become universally hated and feared on the Pacific coast, and posed as the great bully of the Pacific States; but yet it was not quite ready to consummate its cherished scheme of becoming the greatest proprietor of mines in California and the undisputed arbiter of the destinies of this State.

At this point it will be proper to inquire into the physical characters which distinguish and define the mineral lands of California, and in this inquiry the main gold belt may well serve as an example. Within this belt the Sierra Nevada presents a high and rugged mountain chain, rising about 14,000 feet in its southern portion and over 8000 feet in the north. Nearly two-thirds of this great area is within the snow belt, and one-half thereof is covered by snow for five months in the year. In its topography the central and eastern parts of the range, or nearly three-fourths of the whole area, consists of high and abrupt mountains, cut into deep canyons by the affluents of the Sacramento and San Joaquin rivers, the foot of the western flank only sloping more gently to the valley and there forming occasionally low and rounded hills. In the high and middle Sierra the soil is thin and scanty, and the bedrock generally crops out to the surface except in the few deep mountain valleys at high elevations, chiefly in the northern counties, and on some of the broad ridges in the middle counties remnants of the lava flows covering the ancient gravel channels which carry such a large portion of the golden wealth of the State.

The climate here is changeable and often severe, with extremes of temperature from + 100° to — 20°; the average annual temperature reaches only 45°, and beneficent Nature, while endowing this region with great resources in mineral and a wealth of timber, with pure flowing streams and magnificent scenery, has done but little to attract the farmer or reward his labor. It is safe to assert that not one per cent of this region is fit for agriculture as a means of support.

The foothills of the Sierra to their junction with the alluvial land of the Sacramento valley enjoy a warmer climate, and owing to less erosion present a deeper soil, generally from the decomposition in place of the underlying bedrock, which frequently appears at the surface, except where the later gravel deposits by the present streams debouching into the valley have formed deep and extensive beds generally auriferous and frequently rich, as at the outlets of Tuolumne, American, Yuba and the Feather rivers. Of this region the gently rolling lands are suitable for fruit culture and to a limited extent for stock-raising and dairying, as is evidenced by the many orchards and gardens that dot the slopes of the foothills near the main roads. Practically the most of the foothill ranches give but a bare subsistence to the owners, many of whom eke out a living by cutting firewood on the public lands; it is chiefly in isolated instances where individual energy, show and capital have succeeded in producing commercial profits or have founded charming and prosperous homes.

Geologically, all this region from the edge of the great valley to the foot of the eastern slope of the Sierra Nevada presents the strongest evidences of useful minerals, especially on the western slope, and among them gold is always the most prominent. This would be evident to the experienced miner or mining geologist even if actual mining operations had not demonstrated the fact and covered the whole western slope with mines and evidences of mining. Even granting that the so-called worked-out areas of the foothills may be used as agricultural lands, it must be remembered that all this region is seamed by gold-bearing veins, the development of which would create far greater wealth than farming, and would not in the least interfere with the culture of the soil. Why then should not this land be preserved to the miner, who may also till the soil and found a prosperous and permanent home on his mineral land should he so desire. Even the present Commissioner of the General Land Office, in his letter to the Secretary of the Interior, of August 29, 1893, says: "It is deemed, however, that a law should be passed by Congress enabling the Land Department to thoroughly investigate the character of the lands supposed to be mineral and within the reservation of the law, before the railroad is entitled to any cession whatever. It would not be unreasonable to direct that the patents issued should themselves contain a reservation of land therein described if it prove upon further development to be actually mineral land."

The last sentence expresses nearly what the miners of California desire, but they would wish to have the character of the land decided by competent Commissioners, independent of the land office, and whose decision should be made final. It is to be noted that the above opinion appeared before the change of heart of the Commissioner and before the promulgation by the Secretary of the Interior of the notorious, not to say infamous, rules of July 9, 1894.

In the high Sierra the broad lava ridges, generally covered by timber, present no field for the farmer except that a clearing may enable an industrious man to make a scant living thereon under favorable conditions. Their value for such a purpose would bear no appreciable comparison to their value for drift and hydraulic mining. The deep valleys situated within the Sierra, such as the American, Indian and Genessee valleys in Plumas and the great Sierra valley within Plumas and Sierra counties, although probably underlaid by gold-bearing veins and gravels, have long ago been recognized by the miners of these regions as agricultural lands, and support now a prosperous population engaged in farming and dairying, in perfect accord and harmony with the miners that surround them and largely contribute to their prosperity. In the same way and by the same tacit common-sense approval of the miner, the large alluvial tracts along the eastern edge of the Sacramento valley, often markedly auriferous and most prominently so around the outflows of Feather, Yuba, American and Tuolumne rivers, have without any controversy been conceded to be practically agricultural, although profitable mining is in progress at many points within these areas.

The preceding references to the character of the mineral lands may be said to embrace those that are extrinsic and to some extent negative; an inquiry into the intrinsic or inherent qualities of mineral land the world over will furnish still more important testimony.

The auriferous metamorphic schists and igenous crystalline rocks of California find their counterparts almost everywhere on the American continent, and are not at all lacking in the Atlantic States. Nowhere in the world does the experience of the gold miner record as a general fact that the noble metal has been found evenly distributed in paying quantities over a large area; the workable deposits of placer mines compared with the scope of the mineral land are small and generally confined to the lines of erosion by rivers and streams. California alone offers a partial exception to this rule in the extent, diffusion and richness of its ancient gravels. Probably not over ten per cent of the area of most mining claims will contain the actual payable deposit, but every portion of a claim may contain and finally develop a gold-bearing vein of value. Although the practically productive portion of a gold mine may be small, the method of location under the laws must always include much apparently waste ground, which, however, is necessary for the operations of mining. This becomes specially evident in the lava-capped regions, where the gold-bearing channels of mighty prehistoric rivers must be sought for under an unbroken expanse of deep volcanic material, presenting in itself no direct surface evidence of their richness, which, however, is fully demonstrated by developments in surrounding mines.

Contrasting the actual gold values produced from superficial areas of mineral land with productive values of similar agricultural areas, an estimate can be made only of placer mines and chiefly of surface deposits, as in rivers, creeks, gulches, flats and bars. Based upon an extensive experience, the writer would offer the following comparisons: Shallow placers when barely paying expenses to working miners produce $500 per acre; with a production of $1000 per acre such mines pay small wages; at $2000 per acre surface placer mines become fairly remunerative if favorably situated, but the average of profitable placer mines produce from $5,000 to $10,000 per acre.

The production from deep gravels in drift and hydraulic mines generally exceeds $10,000 per acre, and in the case of large hydraulic mines rises to $100,000 per acre. Reliable data place the production of the Smartsville gravel beds, Yuba county, at $60,000 per acre, and of the Spring Valley Company's mine at Cherokee Flat, Butte county, at over $65,000 per acre. It is to be noted that both these mines are now idle and under injunctions. Several drift mines, notably in Nevada, Yuba and Sierra counties, can be cited where the production, if computed on the actual area of channel worked, exceeds $100,000 per acre. Vast tailing beds exist within the main gold belt, containing gold values ranging from $5,000 to $15,000 per acre. These estimates apply to later years; for the earlier periods of gold mining in California previous to 1870 the average production should be trebled, and probably exceeded $20,000 per acre.

An estimate of values in quartz mines, although largely approximate, can be made on the basis of an average yield of six dollars per ton, and width of vein of four feet, when the product per acre, computed on a full-sized location, 1500 feet by 600 feet, worked to a depth of only 500 feet, would be $92,000.

The above values, when contrasted with the product of the average agricultural lands of this coast, become instructive to the political economist, and a comparison between the now current prices of prominent and productive gold and silver mines and those of cultivated farms becomes still more striking. Millions of acres of purely agricultural lands within California remain yet fallow or but slightly used, and can be purchased to-day at moderate prices, even from the railroad companies. In spite of the efforts so apparent to decry the importance of our mining industry and to exhibit it as unstable and speculative, the investments of capital made in this State of late years have been largely in mining properties, and probably in excess of investment in farming lands, and this fact alone largely explains the strenuous efforts of the railroad to absorb the mineral lands.

Meadow Valley, Cal, Jan. 25, '96.

*(To be Continued.)*

## The Best Is the Cheapest.

Every intelligent business man must recognize the fact that advertising is not a matter to be let out to the lowest bidder. It might be so if all papers were of equal value as advertising mediums. But with this value in different publications ranging from nothing to the highest figure, it is contrary to the first principles of business to take the one that will do the advertising at the cheapest rates.

It would be about as sensible to put in office men who might bid the lowest for the place. Fancy a great railway corporation, a bank or an insurance company selecting its president and other officers by competitive bids, without regard to their qualifications, or the manager of an extensive mercantile business, or a lawyer in a suit involving millions of dollars, being selected because he is the lowest bidder! The purpose in all such cases is to secure the best services for the prices paid—the best returns for the money spent.

STICK CEMENT for glass and china is made as follows: Sulphur, six parts; Burgundy pitch, four parts; shellac, one part; elemi resin, 2 parts; mastic resin, 2 parts; kaolin, in fine powder, six parts. Melt all the ingredients together and heat the surface to be joined before applying the cement.

## California Geysers.

One of California's many wonders is the Geysers, situated in the northeast corner of Sonoma county. They are less than 100 miles from San Francisco, and are approached by good stage lines either from Cloverdale or Calistoga, the former being, however, much the nearer to the scene. Our engravings show some of the features of the scenery in the region of the Geysers and the approaches thereto. The scene on the road, which is given herewith, is not one of the most thrilling, for the road on the left in the foreground has a firm hold on the hillside. There are other places where a roadway is claimed upon the flanks of the most precipitous mountains, and grades of hair-lifting degree above gorges of heart-sinking depth test the nerve of the tourist to keep his seat. Thus through peaceful vales and amid quiet hillsides, one approaches mountain wildnesses and the infernal special features of the geyser gorge. Herewith is given a superficial view of this inferno, a rocky glen through which flows a stream of hot water, the ground soft and rotten beneath the feet and burning to the touch, while a seething cloud of steam rises four hundred feet, shutting out all view of the narrow, precipitous path. On a bench that runs along the side of the canyon is a score of holes like the open lids of a great range. They are not two feet apart, yet in one of them the water is black, barely simmering, veritable ink, with which visitors inscribed their names on the hotel register, and in the next one a pool of green water boiling, while a third of milky fluid is undisturbed by its neighbor of amber color that is sending out little jets of steam like a small volcano. As the eye runs along this series of natural pots, kettles, pans and covers, it is easy to believe that the everlasting feast that is being cooked will be a credit to its chef. The range, the background, the floor, are ornamented with the colors from eighteen distinct minerals, and the vapors that greet the nostrils hold a dozen different acids. Farther in the canyon the scenery becomes wilder, the noises lounder, the footing less secure, and the path more uncertain. From fumaroles, cracks and fissures steam puts forth. The names with which man has designated these various wonders are all drawn from the nomenclature of hell. The "Devil's Tea Kettle" boils on and on and wastes enough force to propel the battleship Oregon; the "Devil's Gristmill" grinds away, throwing out steam and hot water with energy worthy of a better cause; "Pluto's Punch Bowl" contains a never-failing supply of hot lemonade that lacks only sugar. Then there are the "Devil's Arm Chair" and the "Devil's Canopy." On the borders of the Epsom salt spring one can scoop up handsful of salts as pure and white and light as cotton balls, while there is a whole drug store of sulphur, copperas, magnesia, soda, alum, potash, to be had for the taking. Description only repeats itself as the tourist works his way slowly and cautiously among this world wreck and up some hundred and sixty feet to a clayey plateau where he can gaze down in wonderment on the "Steamboat Geysers," which snort and blow so that they can be heard miles away.

ON THE WAY TO THE GEYSERS IN NORTHERN SONOMA COUNTY.

DEVIL'S KITCHEN.

## Labor and Time Sometimes Wasted.

Every one having natural feelings is pained when he sees another person misdirecting his efforts to perform a worthy task. This is especially true of inventors. The man who tries to get up a new mechanical device which shall be useful to other people and a source of profit to himself is to be encouraged. His is a commendable undertaking. And the American people have so much talent for such things that innumerable attempts are continually being made in this direction. But many of these are fruitless. Some of the failures involve a loss of money, as, for instance, in materials and patent fees; but they all mean disappointment and a waste of time, thought and trouble. The chief explanation of such mistakes is the inventor's ignorance of what has previously been done by others who had the same general object in view as he. In many cases his idea is not original; some one else has tried to do the same very thing in the very same way. Often a much better device than his is already in common use.

For instance, there is now in service on several railways a track bolt which needs no nut-lock. Several styles of nut-lock are being used yet, and they will continue to be manufactured for a while. But there is no demand for a new style. In a few years the nut-lock will be a thing of the past. So with car-couplings. Partly from self-interest and partly from legal compulsion the railroads have been looking for an automatic device which can be set from a position of safety, so that a man need not go between the cars to complete the job at the instant they come together. Probably over ten thousand patents have been granted on inventions of this one class. After looking over the best of them the Master Car Builders' Association voted a few years ago to adopt for new cars only couplers of the Janney or "vertical plane" type, great hooks that swing sideways and have perpendicular surfaces where they come in contact. There are hundreds of variations of this one style; and railroad experts say that this is the field to which further study and experiment should

FIG. 4.—80-FT. STATION, SILVER KING MINE, KOOTENAY, B. C.

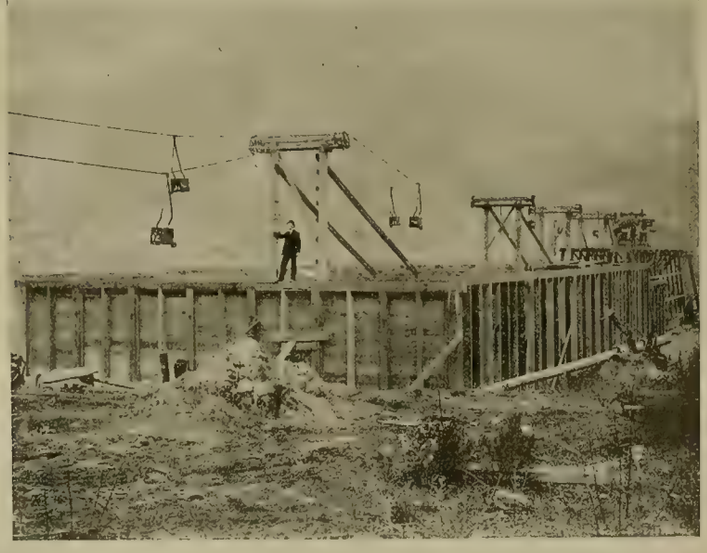

FIG. 5.—LOWER TERMINAL AND ORE BINS, SILVER KING MINE, KOOTENAY, B. C.

(See page 81.)

be confined. But, without knowing this, scores of excellent men with worthy ambitions and in need of money, go on inventing other styles of coupler. They devise mechanisms having more or less merit, but which won't sell. The railroad people won't buy. If you mention this to the inventor perhaps he gets mad or at least suspects your motive. He finds it hard at first to believe you. It would be an interesting question for a debating society to consider whether or not it is a kindness to tell such a man the truth. And so with scores of other inventions.

When a man gets what is a new idea to him he ought to take the pains to find out, if possible, whether it is also new to experts. By proper inquiry he may discover that it has been tried by others and will not work. Or he may find that it is entirely original, and will do what it is designed to do, but that there is a much simpler, cheaper way of obtaining the same result. In either case he could not sell his idea. There is danger that the inventor, in his effort to keep his scheme a secret, will fail to seek information which would save him a lot of work and subsequent despair. Having once satisfied himself that no one else has thought of the same or a better thing, and having made sure that there would be a large demand for the article he has in mind, an inventor should proceed to experiment with the idea. Every detail should be thought out carefully and repeated tests made. It often happens at the last moment that unforeseen difficulties are discovered which make a change of plan necessary. There is danger that a good thing may fail for lack of patience and thoroughness.

## The Training of a Mining Engineer.*

By HENRY LOUIS.

This subject should possess a certain amount of general interest at a moment like this, when we are in the throes of one of the wildest mining "booms" that has ever been known. Many millions of pounds have been invested during the last few months in gold mines, and the public, who have eagerly invested in such mining shares, and who have rushed, not a few of them, to a substantial premium, have done so in many cases upon the faith of the reports made by mining engineers not personally known to them. Upon the correctness or incorrectness of the reports of these engineers will depend success or failure in the investment of all these large sums, and perhaps the fortune or ruin of not a few of the investors.

A knowledge of the sciences upon which mining is based is obviously indispensable, but this knowledge by itself is not enough. The mining engineer must be able to apply these sciences, and in applying them he must forget, as far as possible, the study of science for its own sake, and must bear in mind only the practical results for which he is striving. As an example of what I mean, I may quote a case of an ultra-scientific gentleman who was put in charge of a gold mine, and who resorted to elaborate processes to get out the utmost particle of gold from the ore he was treating, overlooking the fact that it would have paid him far better to have let a little run to waste, because these last grains were costing him far more than they were worth. Similarly in coal mining it is, of course, good practice to get as large a proportion of coal out of a given area as possible, but a point may easily be reached when the cost of the timber that might have to be put in to get the last portions of coal would exceed the value of the coal got. In other words, due regard must be had to what the economist terms the "marginal increment." These are instances of what I mean by following too closely the principle of pure science to the neglect of commercial considerations.

A mining engineer's training should include a short time in an electrical laboratory or shop, where the student may be familiarized with the construction of electrical machinery and the application and measurement of electric currents. Of the importance of mechanics little need be said; such subjects as machine construction, strength of materials, the steam engine, water motors, and many others, come so obviously into the every-day practice of the mining engineer that he must perforce study their principle thoroughly.

A mining engineer is so often called upon to design machines for various purposes, or to test the efficiency of a machine already constructed, that he must be a good mechanic. I hold that it is not necessary for him to actually serve any time in workshops, although he will often find it an immense advantage to be able to use some of the simpler engineer's tools, and more especially to do a little smithing. In out-of-the-way corners of the world I have found the ability to sharpen a drill or to point a pick of greater value to me than might be supposed by those who have never prospected in remote regions.

These three sciences — chemistry, physics, and mechanics, together with the all-pervading mathematics—form the basis of the mining engineer's training. Next comes what may be called secondary sciences, more closely connected with the miners' special work. These are geology and mineralogy.

* Condensed from an inaugural address delivered at the Durham College of Science, Oct. 17th, 1895.

Geology is, to a great extent, the scientific basis of mining; the man whose daily duty it is to exploit certain portions of the earth's crust must know thoroughly the rocks of which it is composed, their appearance, their composition, and the mode in which they were formed. He must not only know geology thoroughly, but must also have some knowledge of the subjects most closely connected with it. For instance, he must know something of palæontology. Evidently, the more he knows the better; but a fair general knowledge, without entering into recondite details, is all he needs. Thus he ought to be able to recognize a tribolite when he sees one, and to know that if he comes across strata containing these fossils he need not waste money in sinking deeper in search of coal beds. This knowledge is quite enough for practical purposes, and he would not be any the better off, practically, for being able to name the genus and species to which the tribolite might belong.

Similarly as regards lithology; this science, in its ultimate developments, is best left to specialists. All a mining engineer really requires is to tell broadly what class of work he is dealing with. It does not matter much to him, as a rule, whether a certain rock that he might come across is (say) a diorite or a diabase, provided that he knows, beyond the possibility of mistake, that he is not dealing with a stratified rock, and what the effect of a dyke of igneous rock is likely to be upon the strata which it traverses. In fact, for the mining engineer physical geology is the most important part of the subject, and one which he must have at his fingers' ends. It is, perhaps, needless to say that geology must be studied in the field no less than in the lecture room, and that the mining engineer ought to be familiar with all the various indications by which geological phenomena can be recognized and traced.

Mineralogy, including crystallography, deserves more attention than is usually devoted to it. The ability to be able to recognize at once any mineral that he comes across is of immense use to the mining engineer, and in this he is always greatly assisted by crystallographic indications. I may quote a case in point. I was once sent to report in a great hurry upon a deposit of magnetite in Nova Scotia that was offered for sale as a Bessemer ore. I found, on examining the ore, that it contained minute needle-like crystals, which, under the lens, appeared as hexagonal prisms, and which, from their crystallographic characters, I concluded to be a mineral called apatite, consisting of phosphate of lime. I accordingly broke off the negotiations at once, and subsequent analysis confirmed the correctness of my diagnosis. Here, then, was an instance in which a knowledge of crystallography saved much time and, possibly, a heavy pecuniary loss. Another instance that came under my cognizance was that of an engineer who had to report on a silver-lead mine. He took his samples from various points along levels, and, as his assays gave very satisfactory results, he was preparing to report favorably when a close examination of some crystals of galena that he had broken out from the roof of a level showed Portland cement on the back of the specimens. Needless to say, this discovery was enough to show him that the mine had been "salted." These two examples will, I hope, suffice to show how the knowledge of what is really a pure science can have a very practical value, even in the commercial sense, for a mining engineer.

The first part of a mining course usually consists of what is, strictly speaking, a portion of geology—namely, on account of the various forms in which mineral deposits are met with, the mode in which these deposits have been formed, and the various classes of dislocations and interruptions to which they are subject. These matters need dwelling on in more detail than is usually possible in a course of geological lectures; indeed, in some continental universities these subjects are elevated to the rank of a separate science, and professional chairs have been devoted to it. The student has next to attack mining proper, and here he comes at once into a new world. He has hitherto been studying pure science; now he has to learn an art, and must from the first be taught to consider it in its trade aspects. All such subjects as prospecting, boring, shaft sinking, exploitation, haulage, winding, pumping, ventilation, and so on, have to be considered in their economic, as well as in their technical, aspects.

All that a lecturer on mining can do is to describe to his students the practice in various parts of the world, and the principles upon which it is based, drawing especial attention to those methods that have proved economically successful, and also, whenever possible, contrasting with them other systems that have proved failures, or have been superseded by better ones. After all is said and done, mining must perforce be learnt in the mine. A combination of practical work with lectures is the best way of learning, but, then, it is always preferable, whenever possible, that elementary lectures should precede the practical work, so that the student may know what to observe and how to observe it. After he has learnt all the pure science he needs, let him attend a course on elementary mining, and not till then let him go underground. Advanced lectures of a more specialized nature should then be attended, say during two days a week, while the student is working in the mine for the rest of his time. Furthermore, there should be special short courses on such matters as mine accounts, mineral legislation, and mineral statistics. Mine surveying should be thoroughly taught in a course of demonstrations, in which the students themselves are made to execute surveys, if possible, underground, or if not, at any rate under somewhat analogous conditions. They should be taught to calculate and plot their own surveys, and especial attention should be directed to the calculation of quantities upon a systematic basis.

A branch of mining that requires special training is that of ore dressing, in which term is included all the mechanical preparation of minerals after they have been brought to bank in order to fit them for market. All methods of crushing minerals and dressing them, whether the object of the process is to save the heavier portions, as in lead dressing, or the lighter ones, as in coal washing, are also included. This subject is best taught by laboratory demonstrations. A laboratory for this purpose should be filled with various types of crushing machines, and with experimental jigs, shaking tables, etc., so that the student can test for himself the effect of various processes, and of various ways of carrying out the same process upon a given ore; there should also be facilities for assaying the products of the operations, so that the student can prove to his own satisfaction the value of his work. Properly conducted, such a laboratory course has immense educational value, in addition to the training it affords in the treatment of minerals, and a student who has gone through such a course will have a grip of his subject and an intimate knowledge of minerals, such as no amount of mere lectures or reading can give him. I am, accordingly, inclined to lay especial stress upon the importance of a course of practical ore dressing.

Finally, the mining engineer must have a good general knowledge of metallurgy. It is no exaggeration to say that nine-tenths of all the products of mines, whether coal or metalliferous, are intended to undergo metallurgical treatment. In fact, minerals are mined and prepared for that object. Unless the mining engineer knows exactly what the processes are by which the mineral he raises will have to be treated, he is not in a good position to judge of the most suitable condition in which they should be delivered, and without such knowledge he is likely to produce an article less readily marketable than the man who knows what after-treatment he is preparing his ores for. Obviously, therefore, the man who knows metallurgy is likely to get better prices for his products than the man who does not. In addition, the study of metallurgy completes and rounds off his knowledge of minerals, and thus puts a finish on his technical education. The minor details of metallurgy are not, indeed, required, but a general knowledge is, and no man can be considered a really thorough mining engineer unless he is a metallurgist as well.

I have now laid before you, briefly, the main elements that should, in my opinion, compose the technical training of a mining engineer, and I venture to think that a man thus trained is in a position to take his place in a mine, and to be of some use from the day he enters it, although, of course, he will have to spend a good many years underground before he can attain any mastery over his subject. It may be objected that such a training as I have sketched out will require a good deal of time. So it will. I do not consider five years any too much to devote to the study of mining engineering. I do not know of any profession that can really be learnt in less, and hold very strong opinions as to the injury inflicted upon the mining industry in every way by the admission into the ranks of mining engineers of men only partly qualified for their duties. Unfortunately, mining is, to some extent, a hazardous career, and chance plays a far larger part in it than in most other pursuits. Hence it may happen that an untrained man now and then finds himself in charge of so good a mine that all his ignorance cannot prevent its paying its way. I remember an instance in South Africa, where a certain mine manager had control of a very successful mine, and for a time enjoyed quite a reputation as a mining authority; yet all this gentleman knew about mining was what he had been able to acquire while following his former occupation of a ship's steward! Such things will occur as long as the duties and training of a mining engineer remain vague and undefined, but it is pretty evident that a clearer public opinion on this point is gradually springing up. One thing is quite certain, and that is that in the face of the keenness of competition all over the world to-day no mining engineer can afford to neglect any item of training that is likely to help him in the struggle for existence, and that no mine can pay so well, in the long run, as the mine that is controlled by a properly qualified manager.

Do not think that I am taking too candid a view of the mining engineer's duties; the sole justification for his existence is that he can make mining pay, and mining, I repeat, is a purely commercial pursuit. Accordingly, as I have said, the mining engineer must be first and foremost a man of business, and must study science, not for its own sake, but for the profit in pounds, shillings and pence that he can get out of its application. If any of you are in-

clined to contrast unfavorably such a purely utilitarian career with the pursuit of science for its own sake, I would ask you to remember that, while the scientist passes his life in adding to the knowledge of mankind, the technician spends his in adding to the stock of human comfort by his labors; and I venture to assert that of the two the latter object is at least as important as the former one.

## The First Calcic Carbide Plant.

Written for the MINING AND SCIENTIFIC PRESS by ORRIN E DUNLAP

The first calcic carbide plant to be built for commercial purposes in America, as a result of a discovery made by Mr. T. L. Willson in North Carolina, is nearing completion on the lands of the Niagara Falls Power Company, in Niagara Falls, N. Y. The product of this initial plant will be shipped to Philadelphia, Pa., and there made into acetylene gas, for use throughout that city and southern Pennsylvania.

As the new plant there is the first of its kind, many interesting experiments will probably be made in it. At the start it will be important to ascertain the amount of electric current which will prove the most economical, for so far the experiments have been made with currents varying from 25 H. P. to 235 H. P. The contract of the company with the Niagara Falls Power Company calls for 1000 or more H. P., a force much larger than before used, it will be seen. One important feature of the plant is that an alternating current furnace is to be used, whereas all the other electric manufacturing plants at Niagara Falls use direct current furnaces. The current is received all on one phase and used at a voltage of about 100, a fact which tells that it will have to be reduced considerably from the voltage at which it is sent out and delivered by the generators of the Niagara Falls Power Company, which is about 2200. At the commencement it is likely that the furnaces will be operated with a current ranging from 100 to 1000 H. P., and it is possible from the dimensions of the furnace that a current of 500 H. P. will be found the most economical.

The size of this first carbide plant is 40x90 at the foundations. The structure is of brick, the front portion being two stories high, or thirty-one feet to the eaves, while the rear part is twenty-one feet. It contains a furnace room, a crushing and grinding room, a laboratory, a switchboard room, a transformer room and a room for the help employed. The crushing and grinding portion of the outfit is to be of sufficient capacity to supply a plant of fifty tons capacity, whereas the capacity of the plant at the start will be at least five tons per day. A two-phase 75-H. P. motor will operate the grinding plant. In the furnace room four furnaces have been built, each containing cast iron crucibles 3 feet 6 inches long, 3 feet 6 inches deep, and 2 feet 2 inches wide. The current will be kept on each furnace for about three hours, one furnace being operated at a time. Each horse power used is supposed to give twenty pounds of calcic carbide every twenty-four hours, and each pound of the product is supposed to produce a little over five feet of gas. It is expected that by February 1st the factory will be in operation.

Considering the fact that calcic carbide is made by the use of such low-priced materials as coal dust, lime dust, water and electricity, and that it can be made anywhere, there is no telling the revolution it may create, especially as it is recognized as the highest illuminant hydrocarbon known in chemistry. The company that owns the Niagara Falls plant makes the claim that acetylene gives more light, throws out less heat, consumes less oxygen and can be produced at much less cost than other illuminating gasses. It is capable of being stored as a solid in the shape of calcic carbide, as a liquid or as a gas. It may be shipped long distances as a carbide or as a compressed liquid gas manufactured from it, and in the latter state may be applied to all purposes of isolated lighting, especially as in railroad trains, street cars, carriages, bicycles, steamships or sailing vessels, street lighting, and it may be used in dwellings, stores or manufactories, its application for the latter purpose permitting the manufacture of a gas sufficiently low priced to be used for fuel or heating purposes.

Acetylene gas, like many other valuable and useful things, was discovered by accident. It has long been known to chemists that carbon will combine with various metals when great heat is applied, but the product called "carbides" has been but little studied. In 1866 Berthelot discovered sodium carbide, and from that on until 1888, a period of twenty-two years, the scientific records fail to report further progress. It was in 1888 that Mr. Willson began a series of experiments in an electrical furnace, and no doubt the electrical development was the actuating cause of the success that accidentally crowned his efforts. Mr. Willson sought to reduce refractory oxides by carbon, the reductions to be accomplished by the heat of this electrical current and not by the electrolytic action. Mr. Willson's experiments were extended over a considerable field and period, and finally he ascertained the fact that a mixture of powdered lime and coke dust introduced into a furnace would develop into a syrup-like mass of practically pure carbide of calcium, which, when taken from the furnace and placed in contact with water, would evolve acetylene gas in great quantities. Calcium carbide is a dense dark brown substance which gives off a peculiar odor owing to the action of the atmospheric moisture. In a dry atmosphere it is odorless. The gas made from it, acetylene, is colorless, and a high authority has stated that as compared with coal gas its poisonous qualities are only one to fifty. The gas has a pungent odor something like garlic; a feature of importance is that its presence will indicate a leak very quickly. The fact that acetylene can be placed in three conditions, viz., a gas, a liquid or a solid, is significant of its commercial future. The promoters of the plant give some interesting figures in stating that, assuming that twenty pounds of carbide are produced each twenty-four hours by each horse power used, the amount made during 300 working days would be three tons per H. P. per year, and applying the 100,000 H. P. available from the present tunnel to its production it would mean the production of 300,000 tons per year. This, they say, should produce at least 3,300,000,000 feet of acetylene gas, which, as its illuminating abilities as compared to coal gas are as ten to one, would represent all of 33,000,000,000 cubic feet of this gas, an amount that equals, if not exceeds, the annual output of coal gas throughout the whole United States. An important feature of acetylene is that the heating effect of its flame is but little more than that of an electric incandescent lamp. As the supply of this factory is to be shipped in barrels to Philadelphia in the form of calcic carbide, it is natural they should compare the illuminating qualities of their product with the gas now used in that city. In this connection it is stated that when acetylene is burned at the rate of five cubic feet per hour it produces a light equal to 250 candles, while to compare their qualities it is further pointed out that the best illuminating gas from coal or water gas is seldom over twenty-two candles for each five feet consumed per hour.

The Philadelphia gas, as is pointed out, is equal to nineteen or twenty candles. Thus it will be seen that acetylene will produce at least 13¼ times more light for the same quantity consumed, or in other words, 1000 cubic feet of acetylene gas will furnish the equivalent in lighting power of 12,500 cubic feet of Philadelphia coal, and furthermore, a three-months' supply of acetylene for a good-sized house can be stored in a cylinder six inches in diameter and four and one-half feet long. But these figures have mainly to do with the nature of acetylene as an illuminant, in addition to which its commercial value for power and heating purposes is to be taken into consideration and studied. There is no doubt that other factories for the manufacture of calcic carbide to supply New York, Massachusetts, Ohio, northern Pennsylvania, Indiana, Illinois, Rhode Island, Connecticut, Missouri, Michigan, Minnesota and other States are likely to be erected at the Falls because of its proximity to the fields from which the materials used in its manufacture are obtained, and also because of the great supply of cheap electrical power obtainable there. Herewith is presented an illustration of the building containing the plant—the first of its kind in the world. This was engraved specially for the MINING AND SCIENTIFIC PRESS and is believed to be the first illustration of the building published.

THE CALCIC CARBIDE PLANT AT NIAGARA FALLS.

AN interesting experiment was successfully performed last month by Mr. P. B. Delany, at a lecture given in the presence of the New York Electrical Society, in the course of which the lecturer sent messages over a telegraph wire at the rate of 100 words in three and one-half seconds. Although the termini of the wire were in the same room, the achievement would be just as practicable were they a thousand miles apart. The strength of the current used was only a little over 100 volts. With a greater voltage, Mr. Delany said that messages could be sent at even greater speed and for any length of time. The messages had first to be placed on a continuous tape in which holes were punched, so many holes representing one letter and so many another. This is done by a perforator that rapidly punches the number of holes representing in each instance the required letter. Then the message is ready for the transmitter. This is a delicately adjusted machine that causes the receiver at the other end of the wire to register a small dash on another tape for each punched hole that passes through the transmitter. No matter how fast this perforated tape passes through the transmitter, impelled by whirling cylinders, the receiver faithfully records each performance at the other end. One wire in this way can, it is said, carry messages as fast as fifty or more operators can get them ready for the transmitter. The speed accomplished at the test given by Mr. Delany was 1714 words a minute.

THE following is a memorandum of rainfall at Edmanton, Plumas county, Cal., during the recent rainstorm. Altitude, 4750 feet; latitude, 39 deg. 54 min. north:

| | *Precipitation in inches.* |
|---|---|
| January 13 | 0.76 |
| " 14 | 1.61 |
| " 15 | 5.03 |
| " 16 | 6.02 |
| " 17 | 3.78 |
| " 18 | 1.55 |
| " 19 | 2.90 |
| " 20 | 3.30 |
| " 21 | 1.07 |
| Total | 26.02 |

Add to this old snow melted by the rain, fully equal to ten inches, and the volume of drainage would be over thirty-six inches, all gone to waste.

J. A. EDMAN.

NOTHING is more expensive than penuriousness; nothing more anxious than carelessness; and every duty which is bidden to wait returns with seven fresh duties at its back.

# Scientific Progress.

### Edison's Magnetic Separator.

The idea of using magnets to assist in the separation of iron from the rock with which it is sometimes associated in the earth has been made the basis of a good deal of experiment and invention during the last few years. Several devices embodying this principle have already been patented and put in operation more or less successfully. The most conspicuous worker in this field, however, has been Thomas A. Edison, who has been busily engaged in perfecting the process in the vicinity of a large deposit of iron ore in northern New Jersey. At a place formerly known as Ogden, but now called Edison, operations have been conducted on a large scale. An extensive assortment of machinery for drilling and blasting the rock to a depth of thirty feet below the surface, scooping out the material thus loosened, and crushing it until it is as fine as granulated sugar, has been set up there. It is possible to take out at least 2500 to 3000 tons there a day, and the crushing, conveying and separating apparatus is said to have a capacity of 10,000 tons.

In a vague way it has been known that Mr. Edison had encountered certain difficulties in the application of his theories, but these are now reported to have been overcome. Some of them grew out of the enormous quantities of dust developed during the preliminary treatment of the ore. So filled was the air with minute particles of grit and dirt that the workmen could not breathe without wearing mufflers over their faces. This they continue to do. But the nuisance has been largely abated by surrounding the buckets carrying the pulverized ore with the coarse bagging commonly called burlaps. Another problem related to the lubricating of the bearings of the great crushing rollers, some of the latter being designed to chew up rocks weighing ten tons each. Mr. Edison, in this and other parts of his establishment, would tear out very expensive appliances which did not work right and replace them with different ones, and it is said that a plant which could, with his present knowledge, be reproduced for $500,000, has cost him up to date about five or six times that amount.

The general plan of separation by means of magnets is to let the powdered ore fall so as to pass very close to the ends (or poles) of several horizontal magnets. Those grains which are made up chiefly of iron will be attracted by the magnets and drawn an inch or two to one side of the path which they would otherwise follow, and will be held temporarily, sticking to the poles, while the purely stony matter, insensible to the influence of the magnets, continues to drop. To perform this service electro-magnets are used —pieces of iron which derive their magnetic qualities from a current of electricity sent through coils of wire encircling them, and devoid of any attractive power as soon as the current ceases. In Mr. Edison's arrangement the downpour of ore is checked every five seconds, and then the current is shut off, so that the particles of iron temporarily attracted to the poles of the magnet are released. They fall on the other side of a thin partition from the non-metallic refuse; and the two go out through different chutes, and are carried off by separate conveying machinery. Inasmuch as the first treatment by this method does not extract all the iron from the ore, the refuse is exposed a second and a third time to the influence of magnets, the three operations being conducted on separate floors. The amount of iron (or rather oxide of iron) originally in the rock and remaining uncollected by the magnets is estimated at less than five per cent.

An electro-magnet may be made in a great variety of shapes. Almost every one has seen the long, flat strip of wood around which, from end to end, a fisherman sometimes winds his line. Mr. Edison, for reasons which will be apparent on reflection, adopts this design for his separating magnets. He takes a slab of cast iron 4 inches thick, 12 inches wide and 9 feet long, cuts a notch in each end, and then winds his insulated copper wire on it lengthwise. The ordinary bar or horseshoe magnet attracts only at the end, not along its side; but by his method of winding Mr. Edison makes the whole nine-foot edge of his slab a "pole." That is to say, it will possess attractive power along its whole length, so long as the wire carries a current. This is much the most economical use of the iron in the core, of copper in the coils and of current that could be made for the particular kind of work to be done. Four or five such magnets are mounted, all horizontally, and one above another, and the powdered ore falls in a thin sheet from a properly arranged trough in front of the edges of the whole set. It is said that no less than 500 of these nine-foot magnets are used for the first separation. For the second and third processes magnets of the same general design are employed; except that the second set have a width of only about eight inches, instead of twelve, and the third set only four and a half inches wide.

The stony refuse, or sand, left by this system of treating the ore is sold to the railway companies for ballast. The oxide is then ready to go to a smelting furnace. Instead of shipping it thither in a pulverized form, Mr. Edison mixes it with various plastic materials that will facilitate smelting, and shapes it into bricks, which are pressed and dried. This latter process, invented by Mr. Edison, is said to render the product more salable.

It should be remarked that Mr. Edison's method of separation is not available for all iron ores, but only for a certain class called "magnetic" iron ores, which are sometimes actually magnetic, but not always so, but in which the oxide is free from various impurities found in other ores.

---

A NEW chemistry of high temperatures, whose applications are likely to be numerous, is being rapidly evolved. In the reverberatory electrical furnace with movable electrodes, which he devised no longer ago than 1892, M. H. Moissan has obtained temperatures sufficient to produce the diamond, to crystallize metallic oxides, to reduce those hitherto refractory, to melt metals hitherto infusible, to distill lime, silica, zirconia and carbon, and to cause an abundant volatilization of such metals as platinum, copper, gold, iron, manganese, chromium and uranium. In this furnace the electric arc is passed directly over the subject under experiment, which is held in a crucible in a chamber of lime. Chromium is reduced from the sesquioxide as an unoxidizable metal, which can be filed like iron, takes a fine polish, and has the advantage over ferro-chromium for alloys of being free from carbon. The great possibilities of chromium alloys can now be effectively studied. Molybdenum, previously infused, can be obtained in considerable quantities, and is found to have a fine grain, and to be capable of being filed, forged at a red heat, and alloyed with iron in a steel that can be tempered. Tungsten, even more infusible than chromium and molybdenum, is readily liquefied under the electric arc, and obtained in a very pure state. Uranium is readily reduced from its oxides, and when slightly carbureted it has the property of striking fire with flint. Of vanadium, known before as an impure gray powder, small quantities have been obtained as cast metal, having a crystalline and brilliant fracture. The current of a dynamo driven by an engine of forty H. P. scarcely sufficed to melt it. Titanium was obtained with currents of 100 to 300 H. P., and has unexpected properties—taking fire in fluorine, decomposing water at a bright-red heat, and, very curiously, burning in nitrogen at a high temperature. These simple bodies all form crystallized compounds with carbon, boron and silicon, some so hard as to cut the diamond. Possibly others besides chromium may give new properties of value to iron.

# Mechanical Progress.

### An Improved Instrument for Draughtsmen.

The draughtsman is constantly having occasion to lay off all sorts of angles. He is apt to employ for this purpose a "protractor," a semi-circular brass plate, graduated to degrees. There are other implements also to which he may resort. But as it is a waste of money and trouble to have more instruments than one actually needs, it has been suggested by Henry Swift, chaplain in the United States Army at Fort Logan, Col., that still another device, which is an essential to the drawing outfit, be so modified as to serve this additional purpose. The protractor can be dispensed with. Mr. Swift has in mind the gutta-percha triangle, which has one right angle and two acute angles. The latter are often of 60° and 30° respectively, but this is not essential. There are other simple ways of getting those angles. The larger one is obtained by using the radius of a circle as a chord, and halving will only give 15 in whole degrees. The inventor suggests, therefore, that the larger acute angle of this implement be one of 64°. This readily subdivides into 32, 16, 8, 4, 2 and 1, thus facilitating the task of obtaining angles of any number of complete degrees. Of course the triangle may be made of any other suitable material. It is only essential that the longest side shall be arranged as a scale.

---

MANY thousand square miles of the northwestern part of New South Wales and the adjacent territory were once covered by an inland sea, and are now occupied by a cretaceous formation that absorbs like a sponge the entire drainage of the western side of the tablelands, carrying the water in unknown subterranean courses to the sea. As the annual rainfall is scanty, this region is too dry for cultivation. In 1879 an attempt was made at Killara station to get water by boring, and an abundant artesian supply was tapped at a depth of 140 feet. In 1884 the Department of Mines took up the work. Its first bore struck a small supply of water at eighty-nine feet, and in December, 1894, it had completed thirty wells, with nine in progress and twenty-three others located, and had failed but once to get water. Of the thirty completed wells, twenty yielded an artesian supply of over 7,000,000 gallons daily, and from ten a daily supply of 500,000 gallons could be pumped. Water for the Northwestern traveling stock routes is furnished by fifteen of the largest wells. In addition to the Government work, private enterprise had completed ninety bores in June, 1895, of which seventy-three gave a combined daily flow of about 30,000,000 gallons, and seventeen supplied water by pumping. Gardens and orchards flourish luxuriantly near these wells. Little water is yet used for irrigation, but recent investigation tends to show that the artesian water-bearing basin extends much farther southward than has hitherto been supposed, and that a great barren region may be transformed by further well-boring into a rich farming country, adding much to Australia's resources.

---

WHILE the attention of the entire world has been centered upon the "harnessing" of Niagara Falls for the purpose of producing and transmitting electric energy for commercial purposes, the citizens of the coal-mining towns in Pennsylvania have been studging how to utilize the vast quantities of culm accumulated near them, for a similar purpose. Culm is the name given to waste coal, having reference in a general way to the great banks of anthracite and lumps smaller than marketable grades, constituting the refuse of the mines for many years back. It is estimated that thirty-five per cent of the total output of the coal mines of Pennsylvania goes to the culm banks, and that there is now 22,000,000 tons of this refuse stored up. The total amount of coal going to waste each year is equivalent to 75,672 annual horse power. It is argued that these enormous culm banks can be converted into electrical energy, which can be supplied to consumers at a much lower rate than is possible for the Niagara Power Company to do, owing to the difference in the original cost of the investment, on which the fixed charges must always be based. In fact, the business men of Scranton, Penn., claim to be able to furnish through their culm banks electrical power at any distant point, at from $4 to $6 less per horse power than the rate charged by the Niagara Power Company, which, as thus far announced, is $20 per horse power for a year of uninterrupted service day and night.

---

MUCH of the rich sculpturing in the new congressional library building is being done by the use of a new invention in the shape of an air chisel. By the use of this marvelous little machine the modern statue is carved quickly and with a precision almost equal to the old masters. Of course a model in plaster is necessary, the compressed air chisel being used simply for reproduction. The tool is not unlike the dentist's drill. It runs under about thirty pounds pressure and strikes a blow between 1200 and 1500 times a minute. An expert does excellent work with this machine, which cuts marble as easily as the carving of steamed wood.

---

IT has recently been pointed out that already the telephone is used, by actual count, ten times as much as the telegraph, the annual figures being put down at about 75,000,000 telegrams and 750,000,000 telephone talks.

# Electrical Progress.

### Electric Elevated Roads.

Chicago is the only city in the United States having an elevated railway operated by electricity. The intramural elevated road, which was in operation around the grounds of the World's Fair, constructed by the General Electric Company under the "third rail" system of patents, was the first road of this character in the country, and it proved beyond dispute that electricity could be used successfully as a motive power for elevated railroads. The Metropolitan Elevated Railroad, then in course of construction, and on which it was intended to use steam, decided to change their plans to accommodate the use of electricity. The track is constructed of a ten-pound T rail, each rail being electrically bound near its center to the supporting structure. The third or trolley rail consists of a forty-five-pound T rail, located on one side of the track and elevated about six inches above the timber safety guards. This third or conductor rail is supported at intervals of about five feet on six-inch square blocks of Georgia pine, treated with paraffine. The blocks rest on a low, circular, iron pedestal, with no insulation other than the wood. The trolley rails are connected by a light fishplate, and are bonded on the upper side by three short copper strips.

The motor cars in use are forty feet in length, and have a seating capacity for forty people, the seats being on the side, and are used as smoking cars. The controlling devices are situated in cabs at the diagonal corners of the cars, and occupy about one-half of the platform, each car containing a three-horse power motor, operated by means of single reduction gears, and a small air pump for working the braking device. The present power equipment of the motor cars consists of two 100-horse power motors of the General Electric 2000 volts type. The current is taken up from the trolley rail by means of sliding iron shoes located on the side near the corner of the car. The motors are capable of hauling four coaches, but two more motors can be added at any time to haul longer trains, as occasion warrants. A speed of fifteen miles an hour can be at-

tained, but owing to the short stop that has to be made at each station, an average speed of twelve miles is generally figured on.

### Electricity in Mines.

Electric explosion of mining charges permits of an absolutely simultaneous explosion of several charges, which is always desirable from the point of view of the destructive effect produced, and at the same time it avoids the loss of time brought about by consecutive discharges, particularly when they have to take place in badly ventilated workings, from which the smoke and gases produced by the explosion can only be cleared out very slowly. Besides, there is no danger from misfires, and the workings can be immediately approached without fear of the delayed explosion, which is always a possibility with powder fuses. Moreover, there need be no danger from fire-damp, or from the act of firing the fuse. All these reasons, M. P. F. Chalon, writing in *L'Electricien*, thinks, will favor the use of electric fuses. Unfortunately, however, they are very expensive. In France, wire fuses cost 300 fr. a thousand, and the discharging apparatus comes to 400 fr. or 500 fr. High-tension or spark-dischargers are a little more economical, but it is not easy to determine previous to the explosion whether they are in perfect order, and it is necessary that the insulation of the conductors should be absolutely perfect. M. Chalon then goes on to describe a cheap American discharger, which he strongly recommends for adoption in fiery workings in French collieries. The discharger consists essentially of a magneto-electric machine driven by a rack and pinion, so that the action is very much like that of a garden hand-pump, an intermediate gear being provided to give the necessary speed. A discharger of sufficient size to produce twenty or thirty simultaneous explosions weighs thirteen kilogs. (about twenty-eight lbs.), including the strong wooden case. It is designed to work with fulminate detonators up to a distance of about 500 yards. It is tested by connecting up to the terminals a small specially constructed incandescent lamp. A separate apparatus is required to test the fuses and line. A current is sent through the line, not strong enough to heat the wires of the fuses, but sufficient to ring an electric bell if the circuit is in good order and complete. An arrangement is provided for adjusting the current to the number of fuses in circuit.

It has been commonly supposed that the two great enemies of pole lines across country are storms and small boys. During the recent gales and snowstorms long stretches of telegraph lines succumbed, involving enormous expense; but it is said that the incessant depredations of juvenile marksmen cause in the year not less trouble than the wintry blast of a blizzard. In Australia they have a different sort of climatic troubles, and reports come to hand of a light and power company there which not only suffered because drouth deprived its wheels of water, but because severe brush fires burnt down its poles and snapped off the wires in all directions. When to such a state of affairs is added the propensity of the aborigines to whittle down the porcelain insulators into arrow tips and spear heads, it is easy to see that the pursuit of electricity in the antipodes has some disadvantages.

ELECTRICITY has been successfully employed by Dr. M. G. Jenison in checking hemorrhage from the extraction of teeth. The current caused instant coagulation of the blood, and gave relief where the usual remedies were without effect.

AN electric wagon recently went from St. Petersburg to Moscow at the rate of twenty-four miles an hour, much to the alarm of the peasants, many of whom threw themselves on the ground and prayed for safety.

## Practical Information.

### A Study of Flame.

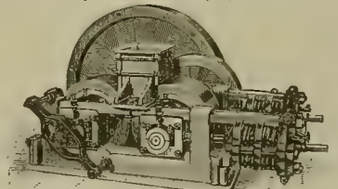
It is the almost universal idea that visible flame is fire in its most notable form; but in fact it is not fire at all. You look into a grate in which soft coal is burning. The flame is leaping in strange, fantastic form fifteen or twenty inches upward from the coal, and with it a good deal of black, sooty smoke. The sooty smoke and the flame are one and the same, with only a difference of temperature. The soot which forms the flame is red hot. It is soot half burned, or rather heated to incandescence but not yet burned—not yet really burned at all. Every particle of the flame is a red-hot coal or particle of carbon. The real fire we do not see; no eye has ever seen real fire. The instant that the carbon atoms become really burned, eaten up by the oxygen of combustion, they are invisible. A particle of the red-hot soot which forms flame contains very many atoms of carbon, and the oxygen eats at them atom by atom, and this atom-by-atom seizure by the oxygen is the real burning, for which the red-hot state is only the preparation.

A soft-coal fire which has died down and apparently gone out may be found twenty-four hours later with red-hot coals "kept," we say, but in fact still burning. The soft ashes closely wrapping them do not keep them alive or burning; they keep them hot enough to let the oxygen go on nibbling furiously at them. The oxygen works inside of the ashes without any trouble, provided only that the red lumps do not get too cold. It, of course, makes fresh heat all the time, and the close wrap of fine ashes keeps this heat right there. The process of such burning is a slow one, but it answers to keep the coal burning.

In burning three pounds of carbon, the heated state of which gives us flame, the fire work is done by eight pounds of oxygen. The oxygen we do not see. The carbon we see only just *before* it is burned; and the result of the burning is eleven pounds of the compound of oxygen and carbon, which the eye cannot see. When a monster steamship burns 300 tons of carbon in coal every twenty-four hours, that means that the 300 tons of carbon are made red hot for burning, and are then consumed by 800 tons of oxygen, with the passing off up the chimneys of 1100 tons of the compound of carbon and oxygen. The heated carbon not yet burned is intensely visible; but as it burns, atom by atom, it ceases to be visible, and the compound of carbon and oxygen is no less invisible, being a gas, each molecule of which consists of a molecule of oxygen (composed of two atoms locked together) into which one atom of carbon has been swallowed, making a three-atom molecule.

The fire belongs wholly to the oxygen. An atom of oxygen is in a state of motion, of spin or whirl like a buzzsaw, only many thousand times faster. These atoms unite in pairs, forming molecules, which have the same spin, only somewhat less swift. It is this lightning spin of the oxygen molecules by which each one devours an atom of carbon, with the effect which we call fire—only the real fire is back of what we see.

The oxygen of the air is a solid cloud of fire; it is essential fire which we breathe. A terrific conflagration only means that this universal fire has found stuff of some kind heated to the degree which prepares it to be consumed. In every case of fire the operation is that of oxygen consuming the atoms of combustibles through that intensity of whirl or spin which all oxygen has, and which is the essence of fire. But the oxygen atom is not a solid atom. It is rather a whirlpool of electric substance or fluid, composed of inconceivably fine atoms in a state of inconceivably rapid whirl. We see a fire start, but in fact there is no start. All the motion that may make to-morrow a conflagration, eating up a thousand square miles of forest, is going on to-day with an intensity very much *greater* than that of a conflagration. In the conflagration every fiery motion is checked by whatever combustible it may devour. The essential fire of the universal air is *greater* while it gives no sign than it is when it gets at work on combustible materials. We cannot too carefully reflect that there never occurs anywhere any new start of motion. What seems a start is only motion, which had existed all along, taking effect as the current of Niagara takes effect on anything thrown into it or launched upon it.



PROF. OSTWALD offers a peculiar speculation which he calls a "chemical theory of the freedom of the will." He regards it as impossible that all natural phenomena should be purely mechanical, as materialists would consider them, for mechanical processes are reversible—they will work backward as well as forward—while natural processes will not. He regards the action of the human will as being precisely like the chemical process known as catalysis, in which an agent influences the time of a reaction without being itself affected. It is exactly thus that the human mind acts on matter, accelerating the chemical and mechanical processes associated with physical activity without any expenditure of energy.

A NEW THERMOMETER has been invented, designed especially for determining the temperatures of difficult or inaccessible places, such as the bottom of the sea, etc. Its action depends upon the well-known fact that different conductors of electricity vary in their resistance at different temperatures, and at different ratios. It has also been applied to measuring the temperature of steel tape, used to establish a base line, instead of ascertaining the temperature of the air, as was previously the custom.—Popular Science.

# Mining Summary.

### CALIFORNIA.

A recent inspection of the great mother lode in California has moved Martin Harkness of Salt Lake to speak of the conditions that prevented the development of this enormous body of free milling gold quartz in the early days. The extent of the vein is 300 feet wide in places and two or three hundred miles in length, and the value of the ore was well known forty years ago, but it then required very high grade ore to pay the cost of production. A miner expected an ounce of gold per day for his labor, and freight transportation from San Francisco to the gold fields was often as high as 50 cents per pound. The stamp mills attempted to be operated were of the rudest construction, the stamp stems being made of live oak beams, roughly shod with iron. In spite of these adverse conditions, the Hayward mine and some others were opened up, and the former has been in continuous operation for forty years and has a mountain of good ore left. Mr. Harkness states that there are many abandoned workings along the vein, which doubtless produced ore not considered profitable in the early days, but which would be regarded as very high grade now. With the application of the cheaper machinery and economical appliances of modern days to the development of the mother lode, he believes its production will exceed that of the whole of South Africa. Salt Lake, Utah, Review.

#### Butte.

In the Golden Butterfly the upraiser has been extended 65 feet; it is believed 20 feet more will reach the gravel deposit; more men will be needed.

The Rock river mines are being prospected.

The Banner shaft is now down 900 feet and will be sunk 100 feet deeper.

NEW MINE TO BE OPENED. — The Golden Channel will soon be opened northwest of Powelton on Butte creek. The channel was struck some years ago and a tunnel was run by Harris & Doon 375 feet. The tunnel will now be extended about 180 feet or until the pay gravel is reached. This mine is believed by old timers to be an extension of the Portuguese channel.

CHEROKEE MINING.—*Mercury:* T. L. Vinton of Cherokee is working about twenty men on the bottom of the Spring Valley Mining Co.'s property, washing out the gravel to the bedrock. Immense quantities of gold have been taken out of land adjoining, and if they could wash the hills down with a monitor, they would give to the world millions of dollars in yellow metal; but they might cover up a few sheep ranches with some slickens, so they simply wash over the rocks or gravel that produces no slickens.

#### Calaveras.

BOSTON-MOKELUMNE HILL. — The Boston mine under the superintendency of Colonel Robinson is making and contemplating numerous improvements. They are constructing a chlorination furnace with a capacity of six tons in twenty-four hours, which will soon be completed. Their shaft is down 300 feet with a necessary sump of more than 50 feet. At 300 they are going to run levels and take out ore to keep the twenty stamps running. In the spring they will add forty stamps to their milling capacity and will put in a large hoist and continue their shaft on down to a depth at which they can keep the mill pounding away. They are preparing to work the ore for both gold and silver, the latter being found in considerable quantity.

PLYMOUTH ROCK. *Ledger:* Thomas Smith, at the Plymouth Rock, who has adopted a process to work the ore by first reducing it to a pulp by milling, without amalgamation, and then treating it with cyanide, virtually the MacArthur-Forrest process, has interested M. P. Morgan and T. T. Lane recently superintendent of the Utica properties at Angels. A ten-stamp mill has been erected, twelve Tulloch concentrators put in and the cyanide plant installed and work commenced about a week ago. They are now treating about twenty-five tons daily which is yielding an average of a little less than $9 per ton. Their assays show that they are saving 85 per cent of the assay value of the ore. At present they are taking their milling rock from a tunnel which enters the hill from a gulch about a quarter of a mile from the Calaveras river. They have crosscut the ledge in this tunnel and find it to be 100 feet in width, about 100 feet from the mouth of the tunnel and about 90 feet from surface.

#### El Dorado.

(Special Correspondence). A San Francisco party last week secured an option on a claim four miles north in the Kelsey district and will begin development work without delay.

A gentleman direct from Cripple Creek is prospecting and bonding property in this neighborhood. He secured an option last week on several claims near Shingle Springs. At present he is over at Kelsey putting men to work prospecting in that region.

The Sunrise ten-stamp mill begins operations to-day. This is about six miles to the north of Placerville.

Work on the Big Tunnel, cutting a number of veins at 900 feet depth in the Gentle Annie group, is progressing rapidly. Melton & Parlow, the owners, are sparing no money in fitting the plant with machinery and equipping it with all the modern methods necessary for successful mining. They are now placing 3000 feet of five-inch pipe to furnish air for the drills and power for the hoisting works. The mine continues its monthly shipments of bullion; but its increased capacity, when completed, will make it one of the great producers of the State.

The Grand Victory last week struck another large body. The new find bears 26% lead and the gold runs over $60 per ton. The continued similarity to this property of the Salisbury, a new plant in course of thorough development, and adjoining the Grand Victory on the south, is causing favorable comment. With 100 stamps on each of these properties, as is now contemplated, they will be among the best paying bullion producers in California.

Work on the Big Sandy, four miles north of here, is progressing very slowly.

It has often been remarked that Eastern capitalists, who take an occasional flyer in mining industries, would not so readily relinquish their mining enterprises if the usual methods applied in the management of mercantile, manufacturing or any other business were adhered to in their mining ventures. Mining and milling ores is not a haphazard affair and should be entrusted to capable and energetic men only, endowed (along with the other necessary qualifications) with prudence and quite a little business ability, particularly when valuable properties are 3000 miles from the men who furnish the bone and sinew of capital for development and construction purposes. These plans followed would save the closing down quite occasionally, and would prevent the condemnation of good and well-paying mines. Capital would not become so chary of investment in legitimate mining enterprises.

J. O'Toole, working at the Taylor mine near Placerville, was struck by a timber while being hoisted last Tuesday and instantly killed. He had been given employment but a few hours before and lost his life by being unable to understand the necessity of keeping his head in and not extending it to look around while the skip was in motion.

Placerville, Cal., Jan. 27, '96.

#### Inyo.

RELOCATED. — *Register:* The Dark Horse mine, fifteen or twenty miles north of Bishop in the White mountains, which was sold to English capitalists a few years ago for $20,000, was relocated this month, the assessment work not having been done. L. E. Girard, M. J. Bradshaw and C. Duarte are the locators.

#### Mariposa.

HITES COVE MINE.—*Gazette:* At the Hites Cove mine, at Minear, the principal work now is development on the lower level, 1000 feet below the surface, at a point 300 feet below the adit tunnel. There are about twenty-six men employed at present, and the mill will continue shut down for the winter. After that, operations will go on upon a more extended scale. There are about 20,000 tons of tailings below the mill, worth from $5 to $7 per ton and these will come in for attention at an early date. For the rest of the winter operations will be principally confined to getting things ready and to exploring by crosscutting and drifting on the vein. There are three parallel ledges in a slate formation. The ore can be mined and milled for less than $2.50 per ton. John I. Minear is superintendent.

About 100 pounds giant powder exploded in a tunnel in the mine last Tuesday, killing three men. The men, Wm. Stern and two helpers, had started to drill a hole for a blast and went to where the powder was kept away in the other end of the drift to prepare the cartridges. How the explosion occurred will never be known, the probability being that one of the unfortunate men dropped a light.

#### Madera.

GRUB GULCH. *Gazette:* The mines at Grub Gulch, about thirty miles southeast of Mariposa, are being started up again. Several men have left Mariposa this week to work there. The principal mine at Grub Gulch, which was once a prosperous settlement, is the Mammoth, which has a complete electrical plant. This power is to be removed to the Healy mine and used there. The Gambette, an important mine, is paying well. In the same group are the Enterprise, the Lucky Bill and several others. The Enterprise is run by water power from the Fresno river, and has a ten-stamp mill. There is considerable activity in mining at Grub Gulch at present, and the indications are that next spring will see a marked revival.

#### Mono.

*Index:* During '95 there were shipped from Bodie, $356,620.71; from Lundy, $102,273.05; Scattering, $7,068.65: Total, $465,962.41.

#### Nevada.

NEVADA CITY MINING DISTRICT.—Activity in Nevada City Mining District during 1895 was even more marked than in that of her sister city, Grass Valley. Probably never before in its history, at least not since the more productive of its mines have become fully developed and the merits of its auriferous veins become known, has this mining district possessed such magnetic force in attracting men of technical knowledge, and capitalists of influence and means. The steady and gradual increase in population and in the production of gold has proved to the world the permanency of our mines and the extent of our prosperity. This may be attributed chiefly to the extensive and judicious circulation of our resources through publications which have been disseminated throughout the principal mining and capitalistic centers of the world. Foreign capital is apparently just beginning to realize the fact that no section of the globe offers better inducements for the judicious investment of capital than does this and adjacent districts. Ephemeral booms such as are boasted of in Africa and Colorado are unknown here, and our people rely entirely on the permanency and uniformly productive character of our veins for their prosperity. It is this fact which cause men who come here to invest in our mines to marvel at our resources and wonder why they have not been more thoroughly advertised in the past. Once they become interested there is a fascination which holds their attention and which makes it almost impossible to relinquish their interest. For this reason we generally manage to retain the capital introduced into our district.

The greatest scene of activity during the past year has been on Deer Creek. In this vicinity there is a network of auriferous veins which it would be difficult to duplicate in any part of California. Situated on the various veins is a group of mines within a stone's throw of each other which have become celebrated for their depth and production. This group includes the Providence, Champion, Mountaineer, Wyoming, Cadmus and Home mines, all of which are in active operation and employing a large number of men. The Providence is among the foremost mines in the State in point of production and depth. It has already attained a depth of over 1800 feet and has to its credit the magnificent sum of $6,000,000, which but few mines can equal. Developments have progressed so rapidly within the past few months that the present mill of 40 stamps is incapable of treating the ores extracted, and it is rumored that forty additional stamps will be erected in the near future. If this plan be carried into operation, it will double the output of the mine and require the services of a much larger force to supply the increased capacity of the mill. It will also give the Providence company one of the largest and best equipped mills on the Pacific coast. The vein carries such a high percentage of sulphurets that the company found it expedient to have them treated at the time, and for this purpose an elaborate chlorination works was constructed. During the past year a new and expensive pipe-line has been laid, which guarantees a powerful and continuous supply of water for motor power.

What is true of the Providence mine is equally true of the Champion mine, which is situated on the opposite side of the creek. This mine has made phenomenal progress during the past year, under the efficient supervision of Frederick Zeitler. It will be remembered that two years ago the Champion Co. was enjoined by the owners of the Wyoming mine. It was stated by the owners of the Wyoming that the former company were encroaching on their mineral rights. This necessitated the suspension of operations for several months and resulted in costly and protracted litigation. The matter was finally amicably adjusted by the purchase of the Wyoming property by the Champion Co., the purchase price being $80,000. The last installment of the purchase price was paid a short time ago and was the product of the mine. In fact, we are given to understand that the entire sum paid for the Wyoming property was extracted from the mine, besides the amount which it took to liquidate the indebtedness incurred through litigation, which is said to be something enormous. In addition to this, arrangements have been made for the construction of an additional forty stamps to the mill. This will make seventy stamps in all. The mill is now in course of erection and when completed will be one of the finest in the State. In the near future we shall witness a material increase in the production of the Champion and a corresponding increase in the happiness and prosperity of our people.

At the Mountaineer mine numerous improvements have recently been made—improvements which, when completed, will place the mine amongst the most prominent gold producers of this district. New pumping and hoisting machinery has been erected, which will develop the mine to a great depth. At the present time the shaft is being sunk below the 800-foot level and considerable stoping is being done. The mill, which contains twenty-five stamps, is kept busy night and day. The mine has been a great producer and Mr. Dennis, the superintendent, has unlimited confidence in its future success. It is expected that it will greatly increase its production during 1896.

At the Mayflower mine, which was purchased less than two years ago by Lane, Hobart, Haywards, et al., phenomenal progress has been made. A complete transformation has occurred. The old mill of four stamps has been superseded by one of twenty stamps which is enclosed in a commodious building and which contains all the modern appliances. A new hoisting works and pumping plant have been erected by the new company which are capable of developing the mine to a depth of 2000 feet. The property is regarded as one of the most promising and productive of the mines of this famous district.

In close proximity to the Providence mine are the Cadmus and Home mines, both owned by a San Francisco company, at the head of which is Mr. Charles Stepp, of Geary street. These mines are being resuscitated under the management of Charles Kahl. They were formerly very productive, in view of the meager manner in which they were developed. In the past few months competent and substantial machinery has been erected on these mines, and the formal christening, which was attended by about forty stockholders from San Francisco, of the machinery was made the occasion of much rejoicing by our people. A very prosperous career is predicted for these mines, and it is safe to say that in the future they will greatly add to the output of the district.

Another of the abandoned mines of Nevada City that has been rehabilitated during 1895 is the Gold Tunnel. This is one of the oldest mines in the district and was located in the early fifties by Capt. Kidd and others. For years it was very productive, immense fortunes having been made by those interested. But it fell into incompetent hands and was finally abandoned through mismanagement. On the 1st of last June the writer, in conjunction with three other gentlemen, secured a bond on the property and since that time extensive development work has been done, with the prospect of the mine eventually becoming a valuable property. The ore in this mine is of a very high grade, paying as high as $500 per ton, with a fair percentage of sulphurets.

Negotiations are now pending for the purchase of the Nevada City and Chapman Ranch mines. These mines are in close proximity to each other, and worked conjointly would undoubtedly develop a valuable property. For years the Nevada City has been a very productive mine. The ore is of a very high grade, and the sulphurets vary from $100 to $400 per ton. It is believed that the negotiations now under way will prove successful and will result in material benefit to the community.

The Federal Loan mine bids fair to be very productive during the current year. Recently a vein was encountered which proved to be very rich in free gold and sulphurets. If this vein continues in depth it will put this mine on a dividend-paying basis. All the other mines now in operation have a fair production and are progressing steadily. From this resume it will be observed that Nevada City is enjoying an era of unbounded prosperity, with the promise of still greater things in the future. SAMUEL BUTLER.

Nevada City, Jan. 28, 1896.

DAM DESTROYED.—Grass Valley *Tidings:* The dam recently completed at Omega has been almost ruined as a consequence of the late storm. The dam was constructed by consent of the Debris Commissioners, and hydraulic mining would have been started in the spring. During the storm a great body of water accumulated back of the structure, and upon advice of one of the inspectors, who was on the ground, a cut was made near one end of the dam to let off the water. It was soon seen that this was a great mistake. The flowing stream gradually wore a large channel in the earth, and last Sunday night a cave occurred which carried away the foundation of a portion of the dam, and before the break could be stayed, 100 feet of the dam had been demolished. The dam was 160 feet long and 65 feet high. The mining ground had been leased to Chinamen, who were about to begin hydraulicking. The cost of the dam was nearly $10,000.

A BIG SUIT.—The suit of the Carson City Mining Co. against the North Star Mining Co. is now on trial in this city before Judge Beatty in the U. S District Court. The plaintiff asks for $825,000 for ore alleged to have been extracted by defendants from its ground during three years prior to Sept. 13, '94, the date of commencement of the suit. It is the old, old question of apex and side lines and extra lateral rights, which means much for mining lawyers.

#### Placer.

*Argus:* The heavy rain of last week caused a landslide at the Osborn or Gaylord mine, and in consequence a large portion of the tunnel was covered up.

Col. Davis has completed a contract for putting in a 85000 electric plant at his Texas Bar mine, adjoining Mammoth Bar. The work will be done under the instruction of Howard Davis, who is general superintendent of his father's properties.

P. M. Ninas, an Ophir miner, picked up a five-ounce nugget the other day.

#### Plumas.

THE SHENANDOAH. — Plumas *Independent:* Supt. S. K. King writes that he will return from Oakland about the first of February, about which time Mr. Smith, son of the late president, will arrive from Denver and the future policy of the company determined.

#### Shasta.

A TALC MINE.—W. R. Conant on his ranch below Castella has a rich body of talc. The paper mills in the East have to ship it from Japan. A few carloads from Mr. Conant's mine have been shipped to the paper mills in Oregon and it was found to be a better quality than the imported article, the Dunsmuir *News* says. On Mr. Conant's ranch there is a whole mountain of it.

HARRISON GULCH.—*Free Press:* At Harrison gulch, Conant, Fowler, Benton and Rhodes, since the 25th day of October '95, put up a mill which milled 160 tons of ore netting 287 ounces of amalgam, valued at $17.50 an ounce, or $4029—more than enough to pay expenses.

IMMENSE HORSE POWER.—At Keswick the Mountain Mines Co. now contemplate the erection of eleven furnaces instead of six as at first intended. This will almost double the productive capacity; the required horse power will be 1500. The company intended to locate a power at the junction of the Pit and McCloud, but found that Fitzhugh of San Francisco has located a water right there ahead of them.

When Iron Mountain was first discovered there were those who said that it was the biggest mine in the world and it looks as if time would make those words prophetic. The Anaconda works at Montana will not be more extensive when those at Keswick are completed.

R. G. Hart will add five stamps to plant at Hart shortly, making twenty-five stamps in all. The rich ore in his shaft 200 feet below the 900-foot level continues. This ore body, nine feet thick, is directly under the apex of the mountain. This is the deepest mine in Shasta county.

NEW MINING CORPORATION.—The Old Spanish Mining Company has incorporated; T. J. Taylor, president; F. H. Deakin, vice-president and treasurer; O. S. Cressby, secretary; F. J. R. Dawson, superintendent.

They have a shaft down on an 8-foot ledge 100 feet, and there are at least 400 tons of ore in sight that will average $10 per ton. In the ledge, at the bottom of the shaft, they have found a vein of sulphurets 14 inches in width and widening. The company will erect buildings and hoisting works and let contracts for the remodeling of the present shaft, and for sinking to a depth of 200 feet. They will then put up a mill and work their own ore. The sulphurets will be taken to the smelter of the Mountain mines, at Keswick.

SLIDES AND WASHOUTS.—The heavy rains have played sad havoc with the Iron Mountain railway. The blasting necessary to build the road loosened the earth, and the soaking rain has caused numerous slides all along the line, they being the deepest where the banks are the steepest. Many of the culverts have also been filled with dirt, causing the water to overflow the road. While this is to a certain extent discouraging, yet they are simply having the same experience as the Southern

Pacific when their road was extended beyond Redding. These slides will occur from time to time for a year or more, and it will probably become necessary to enlarge the culverts. The broadway has not been ballasted, and until it is there will be more or less trouble. It is doubtful if the company gets its works in operation much before May or June.

### Sierra.

GRASS FLAT. Corr. *Messenger*. The Thistle Shaft mine is employing a large force of men.

The Taber mine is expected to resume operations under a new management, in the spring.

The Pioneer mine at Grass Flat is working twenty men.

The Treasure mine at Gardner's Point has been ceased for ten months. The leasers are fitting up the old works and have 500 feet to run before striking new ground.

### Siskiyou.

CENTRAL NOTES. *Journal*. A large majority of the smaller mines in this county, we have not been started up yet, will commence immediately, now that the heavy storms are past. Many of the mine owners would not risk turning the water into their ditches until there was no danger of damage.

The Blue Gravel mine, at Greenhorn, is now employing twenty five men, who are taking out a great deal of dirt, which the proprietors expect will pay handsomely.

At the Barley & Carrick mine on Greenhorn, the force is busy taking out quartz, and by the time the owners of the mine can get the quartz down to the mill for crushing, they will have over 1000 tons out. The rock from this mine has always paid well, and it is expected the quartz which they are taking at present will average better than any former crushing.

The Mint mine near Yreka, owned by Herr and Van Nader, has been leased to Brown and Thompson for one year. The new proprietors are busily engaged in taking out quartz.

The dredging apparatus tested in the Sacramento river and other streams for raising pay gravel, is to be tried next season in the Klamath river. By dredging any part of the river can be prospected to the bedrock, and if not paying well, the dredging boat can be moved to another point for anchorage. It is claimed the scoops will dig down into the bedrock some distance, especially if soft, and thus reach the crevices in which such great quantities of gold is often found.

### Tuolumne.

SONORA. *Independent*. At the Star mine a ten-stamp mill is running constantly. Mr. Gates' new plant for saving sulphurets is completed and in use. Mr. Wilmans, the general manager, and Wilbur Long, the superintendent, are pushing the work of development ahead with energy.

Some rich ore has been struck in the Alameda mine. From the crosscut at the lowest level opened, a contract had been let, to drift along the vein, to the north, for 200 feet, and within this section the rich rock was struck. The mine was bonded by M. B. Harrison some time ago to Hugh McDonald for $30,000. The bond expires in April.

### NEVADA.

THE BUCKEYE MINING DEAL. The Carson *Appeal*, talking of why the placer deal, by which Hayward, Lane and the Hobart estate intended to buy the Buckeye mines at a big price, was finally declared off, says: "It was not the fault of the mines, but the innate, copper-plated hogishness of the people in the vicinity of the claims. Within a few weeks after the sale was announced people rushed in and began locating the ground where the hydraulickers would naturally need a dumping ground. These locations were made on agricultural ground, including Tim Smith's ranch and a mile beyond. Seeing that a move was on foot to compel the mining company to pay any price the owners wanted for this ground or be pestered with law suits, Lane and Tozier, to head off the game, decided to use the west side of Mt. Seigel for a dumping ground. This got out, and inside of a week sixteen hundred acres were located west of the mountain by parties who thought they had a dead cinch on the company. It was here that Mr. Lane saw that he was surrounded on all sides by parties who simply expected to have him put up the capital and do the work, while they took a share of the profits. He decided to throw up the whole thing and fool the hogs. It is this sort of business that has for years driven capital away from Nevada, and as long as this game is carried on Nevada will remain in the dumps."

### LINCOLN COUNTY.

*Tribune*: H. A. Cohen, who manages the De Lamar properties at De Lamar, has bought a large amount of mill machinery which will increase the output of the mines by over 200 tons daily. At present the output is 65 tons. With the additions that are being made to the mill, it can be made to reach 300 tons. The ore is of a peculiar character, requiring fine pulverizing for successful treatment.

### ESMERALDA COUNTY.

A GLOOMY OUTLOOK.—A correspondent of the Hawthorne *Bulletin* from Silver Peak, Esmeralda county, speaks thus gloomily of the outlook for that camp: "Silver Peak proper is very dull at present. Another cloud has come over prosperity. An injunction was served on the company a week ago and everything was shut down awaiting the action of the courts. Prior to this time, we were enjoying prosperity and things looked as though we were on the way to happiness and peace. Now all is in doubt, and we can only hope for a speedy settlement of the controversy, when we will be able to go on producing and assist in the development of old Esmeralda."

At the annual meeting of the Belcher Mining Company 77,587 shares were represented. The following were elected to serve for the ensuing year: James Newlands, president; A. K. P. Harmon, vice president; and J. P. Martin, George D. Edwards and James Newlands, Jr., trustees. C. L. Perkins was re-elected secretary, his financial statement showed an indebtedness of $2941.63. W. E. Sharon was re-elected superintendent; his report showed that during the year they had extracted from the mine and shipped to the Brunswick mill for reduction 1610 tons and 650 pounds of ore, taken principally from the old stopes on the 1000 and 1150 foot levels.

### OREGON.

A KAOLIN MINE. At the kaolin mines at Mosier, Wasco county, there is apparently no limit to the amount they are capable of supplying. The product is valued at $50 per ton at the mines. The mine at Mosier is operated by a tunnel run into the side of the mountain and the cost is apparently light. Thirty-two tons were shipped to New York in '95.

The manager of the Black Gold Channel Mining Company says Chicago capitalists are contemplating the construction of a ditch from the headwaters of Rogue river, to supply water for the use of the 3000 acres of mining ground on that creek. A preliminary survey of this ditch has already, at a cost of nearly $2000, been made, showing the feasibility of the scheme; and the estimates of the amount of rock work, etc., required, and of the probable cost have been forwarded to Chicago.

### WASHINGTON.

A SQUAW CREEK MINE. A recent carload shipment of ore from the Friday mine in the Squaw Creek district went $86 a ton, says the Okanogan *Outlook*. They are now running a tunnel to crosscut the ledge at a depth of about 150 feet. This is one of the best "poor man's" prospects in the county.

NO DRILLS OR POWDER. *Spokesman-Review*: The Deer Trail No. 2 mine, about forty miles north of Davenport, owned by C. C. May and F. H. Luce, has shipped $35,000 worth of high grade ore the last season, and will, as soon as transportation permits, ship about fifteen cars of ore monthly. There have been no powder or drills used in the mining. Picks and shovels are all that is required. It is knocked down, broken up and put into sacks for shipment. There are six tunnels on the property and fifteen men are at present employed in working it. The ore is hauled to Davenport and from there it is shipped to Tacoma. The rock is of such a character that the owners are compelled to timber the mine, and this is the greatest expense.

### BRITISH COLUMBIA

PILOT BAY SMELTER.—The smelter at Pilot Bay, from March to December 30, '95, shipped 3220 tons of bullion to Aurora, Illinois, for refining. During the year the smelter company transported 52,000 tons of ore and lime rock from the Blue Bell mine, and purchased 2500 tons of ore of the value of $156,464 from outside mines. Since July 10, 1894, the company has expended, for machinery, labor and purchasing ores, over $650,000. During 1895 the company employed over 200 men daily, and paid out for labor $170,000. It also paid out during the same time over $85,000 for supplies, $70,000 for duties and $92,500 for freights.

### UTAH.

The Anchor mine near Park City is producing second-class ores which carry a big per cent of zinc. Some years ago it became necessary to throw off much of this metal to bring the concentrates within the commercial demand, so the jigs were set for that purpose, and thousands of tons of zinc were run down the creek a few miles, to be caught by dams thrown acsoss the gulch. Later the jigs were arranged to save this zinc, mixed with silica, afterwards to be piled in a great dump by the side of the mill. At the last annual meeting of the company, in November, the manager—David Keith—reported that "the tailings of the mill, amounting to over 16,000 tons, averaging 8.4 per cent lead, 10 ounces silver and from 26 to 30 per cent zinc, and consequently unmarketable, have been sold under a contract at $1 per ton as it lies.

LARGE CONTRACT LET.—*Tribune*: Vice-President W. R. Busenbark and Manager Kislingbury of the East Golden Gate Mining Company have let a contract for a 200-foot shaft, to be sunk on their group, situated east of the De Lamar property, to John Lynch & Co. It is to be a large, double-compartment shaft 4½x9 feet in the clear. The company furnish framed timbers and pay $9.50 per foot for the work. Some time ago Manager Kislingbury advertised for bids for this work, but contractors were afraid to take hold, fearing that a vein of water might be tapped and make it a very unprofitable venture. Messrs. Lynch & Co. refuse to bind themselves to sink more than 100 feet at the same figure should water impede their progress. Manager Kislingbury says the company will erect a large shaft-house, and a suitable engine will be in position by the time Lynch & Co. have completed their contract for the East Golden Gate Company to sink 500 or 600 more, where they expect to strike the main ore body.

### IDAHO.

Mt. Home *Bulletin*: Supt. Thompson, of the Bear Creek Alluvial Gold Co., at Rocky Bar, departed for Scotland Friday evening, where he will spend the remainder of the winter, expecting to return in March to renew work on this gold mining enterprise. During the past season he has constructed over 2,000 feet of double flume along Bear creek and removed innumerable tons of big boulders with a steam portable derrick. He has expended nearly $50,000 getting this property in good working condition, and has that much more at command. Next spring a ditch will be constructed to convey water from the head of Roaring river to the Red Warrior divide, a distance of twelve miles, for the company's use.

THE HIDDEN TREASURE.—The *Statesman* was recently shown figures giving results from a quantity of ore and concentrates shipped from the Hidden Treasure mine, near Boise, in Neal district, to Salt Lake. They were 11,894 pounds of concentrates and 1879 pounds of raw ore. The concentrates yield $82.62 a ton and the ore $156.54 a ton.

### MONTANA.

BOSTON & MONTANA.—*Mines*: Captain Couch is now preparing his annual report of the operations of the Boston & Montana Company for the past year. The company produced about 10,000,000 pounds of copper during that period. The company last week declared a quarterly dividend of $2 per $25, payable Feb 20th, to stockholders of record, Jan 21st. With this payment, $8,775,000 will have been paid in dividends to date.

### SOUTH DAKOTA.

A NEW ROASTER. At the Golden Reward mine, near Deadwood, the Brown roaster is now in successful operation. It is an elliptic, reaching around the building, 258 feet, the ore bed raised above the ground about three feet, resting on a foundation of brick work. There are two rails, one on the inside and one on the outside of the ellipse, upon which carriages are run, propelled by a cable running around the inside of the curve. One hundred and eighty feet of the ore bed is covered with a brick arch, with four fire boxes at intervals, so placed that their heat is driven through between the bed and arched roof. The ore, which is ground to a thirty-mesh fineness, in the main building, is carried to the roaster, where an automatic feeder lets it in by gradual feeds. There are four carriages with shovels that resemble a farm cultivator, being wide enough to cover the eight foot surface of the ore bed, and when a carriage goes into the roaster it trips the feeder, allowing ninety-two pounds of ore to fall into the roaster, and the shovels onto the machine, which goes right on through at a steady measure, keeping the ore moving gradually until it is finally swept off the end of the bed onto an elevator that carries it up into the solution tubs. The shovels on each carriage mismatch the ones upon all the others, so where one set leaves a ridge the next splits it, thereby keeping the pulverized ore evenly distributed throughout. The last seventy-eight feet of the ore bed is open, and it is here that the ore is cooled sufficiently to be handled by the elevator. A carriage goes under the feeder every fifty-five seconds, taking in with it ninety-two pounds of ore, which, reckoned by the day's run, would approximate sixty-five tons. It is estimated that the ore is under heat for eight or nine hours, as it is moved but a few inches by each carriage. There is a brick ridge between the car tracks, and cable pulleys, and the ore bed, and but little heat is felt by the track and cable, although within a few inches, and in view, the heat is intense, the brick shield being a breaker of the heat, which is directed much as is the heat of a blacksmith's forge. The gearing of the carriage is ball-bearing.

### WYOMING.

The Casper *Derrick* reports having sold over 1000 oil placer location blanks during the first two weeks of this year, which indicates pretty lively times among the oil prospectors of central Wyoming.

### COLORADO.

Golden is to have a concentrating works with a capacity of 50 tons per day.

An English syndicate with a capital of $10,000,000 proposes to drive a tunnel which will cut Pikes Peak at a depth of 5600 feet.

The new smelting charges have compelled a good many leasers in the Aspen mines to stop work. A grade of ore that netted them about $8 per ton last year barely nets them 15 cents a ton under the new arrangements.

The gross value of the output of the Isabella properties last year, according to General Manager Freeland's annual report, was $362,220.22, and the net profit $160,456.77. Mr. Freeland sends a form of lease and a blank report which appears superior to anything of the kind heretofore received. The blank report is a model of completeness and utility, and is worthy of reproduction, did space permit.

The main vein has been opened for a length of 1800 feet and to a depth of 400 feet. The large area of unprospected ground is being developed under short-term leases. The plan of development comprises four shafts in a row at 800 feet intervals. Three of these have steam hoists. The company has 1500 feet of shafts, 7776 feet of levels, and 2935 fathoms of stopes.

During 1895 there were hoisted from the Buena Vista shaft 9645 mine cars of first-class ore, 4064 cars of second-class, 6629 cars of third-class, 3394 cars of fourth-class, and 9224 cars of waste, a total of 32,956 cars of ore and waste, and 13,478 cars of water, a grand total of 46,434 cars. A car holds about three-fourths of a ton. The expense of mining per gross ton of ore mined in 1894 was $17.78. In 1895 this was reduced to $16.21 per ton.

Total cost, based upon the cars of ore and waste hoisted during 1895, was $3.53 per car, being a reduction of 43 cents over last year.

The average net value of the smelting ore in 1894 was $52.03, and in the first half of 1895 was $62.27, and in the second half $121.07, and in the last quarter $132.64.

The gross value of the ore product of the company for 1895 was $362,220.22. Deducting cost of treatment, sampling, transportation, royalties to lessees, etc., the net profit at the mine was $160,456.77.

### NEW MEXICO.

Silver City *Enterprise*: The Graphic Mining Company has filed articles with the territorial secretary. Incorporators, H. LeB. Mills and Singleton M. Ashenfelter, of Colorado Springs, and Charles H. Curtis, of Hanover, N. M.; objects, mining and kindred pursuits; capital stock, $2,000,000; life, fifty years; directors, J. B. M. Grosvenor, John R. Stuyvesant, T. G. Gordon of New York City; Charles H. Curtis and A. E. Dawson, of Hanover, N. M., principal place of business, New York City, with a New Mexico office at Hanover.

### MINNESOTA.

A BIG SUIT. In the United States Court of Appeals, Judges Caldwell, of Arkansas, Thayer, of St. Louis, and Sanborn, of Minnesota, sitting in bank arguments were begun this week in a big case. J. D. Rockefeller, president of the Standard Oil Company, is the defendant. The amount involved is approximately $1,000,000. At the trial of the case on its merits, in the United States Circuit Court, sitting at Duluth, before Judge Riner and a jury, a verdict was given for the plaintiff, Alfred Merritt, Jr., for $40,000. Mr. Rockefeller's interests are represented by George W. Murray, of New York, and associates. The plaintiff is represented by A. A. Harris, of Duluth, and associates. In August, 1892, the Merritts, who had the controlling interest in some iron mines in St. Louis county, Minnesota, valued at $10,000,000, went into a deal with Rockefeller. A new company was formed, known as the Lake Superior Consolidated Mining Company, and the Merritts received stock in the new company in exchange for their interests. Merritt, in his original bill, charges that he and his partners were inveigled into the deal by the fraudulent representation of Rockefeller as to the value of the properties he controlled. He alleges that Rockefeller represented his mines to be in a prosperous condition, whereas the contrary was the case. That while Rockefeller agreed to a valuation of $10,000,000 on the Merritt properties, they were easily worth between $13,000,000 and $14,000,000, and that they subsequently discovered that while they yielded their interests for stock in the consolidated company, Rockefeller retained for his part bonds secured by first mortgage bonds to the value of $4,000,000 on the properties, to which stock held by the Merritts were subject.

### ARIZONA.

LA FORTUNA. *Sentinel*: Mr. Lees, the head millwright of the Utica mine at Angels Camp, California, owned by Mr. Lane and associates, passed through here Tuesday night with several assistant millwrights en route to the La Fortuna mine, bonded several months ago by Mr. Lane and R. M. Straus.

On his arrival at the mine he immediately commenced to lay the foundation for a twenty-stamp mill and now with his assistants is rushing it to completion and in a very short time the mill will be pounding out gold. There are now employed at this mine, developing it, about 30 men. Hauling the timbers from Blaisdell station, twelve miles southeast of this place on the Southern Pacific Railroad, to the mine, across the sterile mesa to the foot of the Gila mountains, a distance of sixteen miles, is engaged thirty-eight head of horses with drivers and wagons.

The English company, which has been in the past operating extensively in Harqua Hala, has taken down the air compressor and hoisting works and ceased operations, giving a lease on the properties to Arizona miners, receiving a royalty on the output, and will devote attention, so far as that camp is concerned, to milling only.

### LOWER CALIFORNIA.

THE CEDROS ISLAND MINES.—The Cedros island mines are sold to English and California capitalists. The mines were bonded a year ago by the Cedros Island Mining Company to H. A. Howard and F. Robbins of San Diego for $15,000. They were worked for some time, the ore transported to National City to the ten-stamp mill of the company, and there worked, but owing to the refractory nature of the ore it was found impossible to treat it with a profit, and the mines were shut down. The company owns the most promising prospects on the islands, embraced in a concession obtained from the Mexican Government. The principal owners in the company are L. S. McClure and C. B. Richards of San Diego. There are about 5000 tons of tailings at the National City mill, which will pay $12 per ton if properly treated. It is understood that the purchasers have a new method of treating the ore which they are confident will prove a complete success.

The above was condensed from recent extended accounts of the transaction. The following was received this A. M.:

SAN DIEGO, CAL., Jan. 28, 1896.

MINING AND SCIENTIFIC PRESS:—The article published in the *Chronicle* of the 25th, purporting to be an account of the sale of the Cedros island mines, is untrue in every particular. It was furnished to the *Union* of this city by an alleged assayer and metallurgist of this place and was manufactured out of the whole cloth for the purpose of injuring the property and handicapping a pending sale. Mr. Frank Robbins has no interest whatever in my bond on the mines. The property has not been sold. Yours very truly, H. A. HOWARD.

[This is here published only to show why the MINING AND SCIENTIFIC PRESS so often declines to publish sundry statements sent in relative to the alleged sale, disposition and working of mines, big strikes, glittering prospects, etc., till opportunity is afforded for inquiry and investigation. This is done in the interests of the parties themselves, primarily, and to preserve its general reputation for accuracy and reliability. Its desire is not so much to have "the very first news" of a mining transaction as to have it correct and authentic, for it very often happens that serious injustice and injury is done to deserving property by false or misleading statements regarding it. We are personally cognizant of instances where premature and incorrect publicity has spoiled a mining transfer of a perfectly legitimate nature, though as a general thing it is the frauds and fakes with which the mining world is infested that suffer the most from publicity.]

### MEXICO.

#### SONORA.

MINAS PRIETAS.—There are ninety stamps at work in the three mills; additional stamps

are contemplated. It is evident the large ore bodies in the Creston and the Minas Prietas cannot be handled by the forty stamps of the Prietas mill.

The Verde mine has been running two Huntington mills for the past twelve months, but shortness of ore stopped one, caused by neglect to prospect and keep on the ore. Diamond drills are now at work prospecting.

The Creston is the principal mine in the camp, and is down 900 feet with a double compartment vertical shaft. The vein inclines until at a depth of 300 feet where it is upright. This property has been developed under Sterling Mahan's direction. It is timbered with heavy Oregon pine.

The stations in the mine show the ore bodies on all sides and are 40 or 50 feet square. Electric lights are used. In some places crosscuts have been made fifty feet and no foot or hanging wall is seen.

Conservative men say it will average $30 in gold and $40 in silver.

The tailings of the ore is going through roasters lately erected by J. H. Magruder for the company.

The Minas Prietas mine joins the Creston and was bought for $65,000, including the forty-stamp mill. Report says the mill ran on the Prietas ore one month and paid the purchase price.

The process of working the Creston and Prietas ores is by amalgamation.

The Amarillo mine has a twenty-stamp mill at work.

### SIAM.

MINING IN SIAM.—Mining of tin ore on a small scale is developing more activity at present in the northern part of the Malay peninsula, likewise the digging of rubies near Chantabun. Most of the concessions granted for gold and coal mining during the last five years have been forfeited and never renewed, because the prospectors could not raise the necessary capital. The Goldfields of Siam Co. of London, which had commenced to operate the gold mines at Bantapan in 1888, became defunct after losing the entire capital stock. The Sapphires and Rubies of Siam Co. of London liquidated after working three years without profit. The concession of the latter was bought by the newly organized Siam Exploring Co. of London, with a capital stock of £100,000. In the southeastern provinces of Siam, on the line of Cambodja, a Parisian syndicate has bought the three gold mines of Wattana, Buckhanon and Sakeo, which were operated formerly by Siamese. French experts are of the opinion that the enterprise will furnish good profits. The French intend to buy also the English gold mine Kabin, which is situated in the neighborhood.

### SOUTH AFRICA.

A LONDON OPINION ON JOHANNESBURG AFFAIRS.—We hear by cable that the mines are said to be at work again, but this must be taken *cum grano salis*. There is a difference between a mine in full work and a mine in work. The mine in full work is developing as fast as it is stoping. It is keeping its cyanide works in operation and performing the thousand and one other duties that are implied by the expression—"A properly managed mine." A mine in work may be merely keeping the mill going on ore reserves in the ore bins, and there may be no development. In other words, the mines may mostly be living on their reserves, which cannot go on indefinitely.

We prefer to take an opinion between the two extremes, and believe that the Randt mines, without exception, are as short of labor as they were during the whole of December, before the revolution commenced. We shall not be surprised if the January output is reduced by one-half, and it will take at least three or four months (assuming there are no further disturbances) to put things on their old footing again. Meanwhile, it will relieve us to hear that the mines have been kept free of water; for if that is the case, not much, if any, permanent mischief has been done.

Some of those who have been "run in" have not raised arms against the Boer government, but merely taken precautions to defend themselves. After those who were opposed to the Government had been agitating for some time a lot of the better class citizens united for the purposes of mutual protection and the defense of the town in case of riot. We fancy the upshot of the arrests will be this: that four or five of those arrested will be banished from the State for five years, their property in the State confiscated and that about two-thirds of the lesser lights will be let off and the remaining third fined in sums varying from £500 to £5000, which they can well afford to pay. If they cannot, there are those who will subscribe to pay it for them.

The Government has evidently its knife into Mr. Lionel Phillips, who, as President of the Chamber of Mines, made the speech which is supposed to have sounded the signal of revolt. For a long time Mr. Phillips and his firm (Werner, Beit and Co.) were on the best terms with the Government, but latterly their relations have become strained, and then the whole weight of the firm was thrown in against the Government. It is unquestionable that Lionel Phillips and his immediate *entourage* are those against whom the chief animus of the Government is directed.

Our ideas of the punishment (as above) to be meted out is merely a forecast, but first of all the alleged delinquencies will have to be tried by the High Court of the Transvaal.

Though opinion is pretty unanimous here in favor of the action of Mr. Chamberlain, it is divided on the other side. His proclamation was the chief engine that destroyed the hopes of the Johannesburgers. If it had not appeared, and if Sir Jacobus de Vet, the British agent, had followed his instructions and gone out to prevent Jameson attempting to pass the cordon of Boers, Johannesburg would be in a state of quietude, and those who are now languishing in gaol would probably have been at the President's residence at Pretoria, discussing methods for the amelioration of their lot.—London Mining World, Jan. 18th.

## Professional Cards.

A Department of Electrical Engineering

Has been established under thoroughly qualified instructors. The course is thoroughly practical. Send for Circular. C. S. HALEY, Sec.

## Coast Industrial Notes.

—The Los Angeles Oil Exchange has advanced the price of crude oil from 30 to 50 cents per barrel.

—The lightship Umatilla Reef, the first electric lightship on the Pacific coast, is being built at Portland, Or.

—Moran Bros., Seattle, who have a Government contract, are making big preparations to go into the shipbuilding business.

—The General Electric Co. has about forty men finishing work on the forty miles of wire for the Fresno electric transmission system.

—The Roanoke, which arrived last week from New York, has on board 5000 tons of rails for the San Joaquin Valley railroad, which will be taken to Stockton on barges.

—The Senate Committee on Commerce has reported favorably on Senator Squires' bill providing for the construction of two revenue cutters for service on the Pacific coast.

—Two 100 H. P. gasoline engines are being built by the Golden State and Miners' Iron Works—one for the steamer Newark, the other for the schooner Barbara Hernster.

—Nearly 300 men are now at work at the Harbor View works of the Fulton Engineering and Shipbuilding Works. They are now building a new steamer, the President, for the Alaska Packers' Association, 140 ft. long, 30 ft. beam, with 350 H. P. triple expansion engine.

—About 750,000 barrels of beer are annually brewed in this State, of which amount three-fourths is produced in San Francisco annually. The business annually uses up 100,000,000 pounds barley and 1,000,000 pounds hops. About 1200 men are employed in the manufacture.

—This week the directors of the S. F. & S. J. V. R. R. let contracts for 18,000 tons of steel rails, 150 flat cars, in addition to 100 already ordered, and $100,000 worth of plates, bolts and spikes, aggregating nearly $700,000. Sufficient material is now ordered to build the road to Bakersfield.

—The Bancroft library of this city has been offered for sale to the New York public library corporation. Although estimated to be worth $500,000 by its owner, Hubert Bancroft, the price asked for it is $300,000. It contains about 60,000 volumes and manuscripts, all relating to the Pacific coast region, from Alaska to Panama.

—The gratifying advance in wheat, though partially checked, justly encourages that great California industry. From 80 cents to $1.15 per cental means a little over $5,000,000 more received by the California grower every year. Argentine speculation and an almost total Australian failure are among the causes for the recent great advance in California wheat values.

—S. M. Knight of Sutter Creek is having built a dredger bucket of his invention, to be operated by compressed air, for the San Francisco Bridge Co., for use in excavating on Puget Sound. It has a 75-ft. hoist and has an estimated capacity of 1000 cubic yards per day. It is said to be the largest bucket of the kind ever built and has cost nearly $3000.

—A new line of business has recently been opened on this coast—the manufacture of machine oil from sharks' livers. Three Norwegians have bought a boat and claim they can catch all the sharks they can handle. They find them in schools north of Cape Flattery. Only the livers are utilized in making oil. The *Lumberman* says the oil sells for from $10 to $12 a barrel at wholesale on Puget sound. It makes a fairly good oil for slow running journals.

—The Panama Steamship Co. is going out of business. For the last six weeks the company's employes have been chiefly engaged in winding up the corporation's affairs, and the leases on the two other steamers of the line have been relinquished. The Panama Railroad Co. intends to continue its operations as an independent carrier between Atlantic and Pacific ports, but future ocean transportation will be made through its connection with the Pacific Mail Co.

—The Manufacturers and Producers' Association, being unable to secure the Mechanics' Institute building for their proposed exhibition next March and April, contemplate the erection of a pavilion, to be filled with an exhibit of home products, at the earliest possible date. Chairman Scott has appointed Messrs. Mead, Bowers and Tracy as a special committee on the subject. The annual meeting of the association, which had been proposed to be held this month, has been postponed.

—The Yukon Transportation Company, Seattle, Wash., composed of Eastern capitalists, will operate freight and passenger boats on the Yukon river and its tributary streams and lakes, the entire run extending from Seattle to Circle City. Two lines will be operated—one for passengers from Juneau, via Linn canal, the Chilkoot pass and the upper lakes, and the other via the Yukon river, over the route usually taken by miners to Circle City, over the divide (Chilkoot pass) a distance of 28 miles. It is the intention of the company not to do any trading.

—Recent industrial and manufacturing incorporations are: Katz & Sons, San Francisco; capital stock, $20,000; subscribed, $20,000. Marshall Gold-Saver Company, Fairfield; capital stock, $100,000; subscribed, $100,000; J. Marshall and J. Wing of Fairfield, J. M. Gregory and J. A. Ostrander of Suisun and W. Tucker of Vacaville, directors. State Mining Journal Publishing Company, San Francisco; capital stock, $60,000; subscribed, $10; J. Power, D. L. Munson, L. T. Lewis, B. Vale and H. de Laguna, directors. Triumph Development Company, Fresno; capital stock, $250,000; subscribed, $225,000; F. A. Alexander, M. Minor, M. H. Heitzig, C. A. Shattuck, H. W. Skinner, J. Green, I. A. Hodges, C. J. Minor and W. D. Crichton of Fresno, directors. Mill Valley and Mount Tamalpais Scenic Railway, San Francisco; capital stock, $200,000; subscribed, $45,600; C. B. De Fremery of Oakland, C. Toohey and W. C. Savage of Marin, A. A. Martin, D. McKay and C. E. Green of San Francisco and S. B. Cushing of San Rafael, directors. Getz Brothers & Co., San Francisco; capital stock, $250,000, all subscribed. Los Angeles Bridge Company, Los Angeles; capital stock, $10,000; subscribed, $1000; D. W. C. Sawyer, B. J. Arthur, R. A. Sawyer, K. L. Arthur and J. P. Spence of Monrovia, directors. Consolidated Asphalt Company, Los Angeles; capital stock, $1,000,000, all subscribed; W. H. Worswick, G. B. Hannaman, F. M. Hannaman and C. E. Donatin of Los Angeles and J. Worstwick of Hanford, directors.

## Personal.

F. A. HUNTINGTON is in Denver, Col.

MAJOR HEUER left for Cincinnati, O., yesterday.

COL. SUTER and Col. Davis have arrived and taken charge of their respective departments.

ALEX. HILL, the superintendent of the Mountain Mines Co., Shasta Co., is in this city, on his way to England.

DR. CHARLES E. BULLMAN, of Plainfield, N. J., formerly editor of the *Safety Valve*, has been selected as secretary of the Venezuelan Commission.

JNO. HAYS HAMMOND is the only American now held in confinement by the Boers at Pretoria, South Africa. Strenuous efforts are making by his friends here to secure his release.

J. B. LOW has been experting the Golden Gate mine in Butte Co., and cables the London owners advising crosscutting to the west, indications being favorable for ore in that direction.

VICTOR CLEMENT, one of the American miners arrested at Johannesburg, South Africa, went from the Cœur d'Alenes two years ago to superintend one of the mines there at an annual salary of $20,000.

A. D. GASSAWAY, recently superintendent of the West Harmony and Delaware mines, Nevada Co., has accepted the superintendency of the Mayflower mine, on the Forest Hill divide, Placer Co. The Mayflower is the largest drift mine in the State and now employs 110 men.

COL. CHAS. R. SUTER has arrived from St. Louis. He succeeds Col. Mendell, of the U. S. Engineer Corps, as Division Engineer for the Pacific coast, and is distinguished by his presidential appointment to that important position from the list of prominent applicants therefor.

R. E. BROWN, who has been mentioned considerably in the recent Transvaal imbroglio, is a mining engineer by profession; has studied law, and edited newspapers. In his capacity as engineer he was employed by the Gem company in Idaho, between 1888 and 1891. In the latter year he started the *Barbarian*, a weekly paper in the Cœur d'Alenes, and was promotor of a townsite on Gray's harbor, Wash., which he called Gray's Arbor. The townsite was not a success, and Brown went back to the Cœur d'Alenes in 1892 and bought the Wardner *News*, which he rechristened the *Barbarian*, in memory of his former paper. It fought the miner's union, and it is said that a number of threats were made against the editor's life. Mr. Brown then went to Wallace, Idaho, and started the *American*, and ran for the Legislature, but was defeated. He then went to Spokane, Wash., and started the *Silver Outburst*. In a little while he went to Chicago, and was there for a while associated with Mr. Harvey in the publication of *Coin*. About two years ago he went to South Africa. His career so far is of a nature that is more interesting than prosperous.

## Mining Incorporations This Week.

King Solomon Mining Company, San Francisco: Directors, W. A. M. Van Bokkelm, J. M. Linehan, J. Stadtfeld, Jr., J. W. Bourdette, C. H. Morrell; capital stock, $3,000,000; $250 subscribed.

Hexter Gold Mining Company, San Francisco: Directors, F. W. Page, A. B. Moulder, J. W. Duke, C. F. Hamilton, and E. C. Jennings; capital stock, $30,000,000, $1,050,000 subscribed.

Jackson Gold Mining and Milling Company, Jackson; capital stock, $750,000; subscribed, $25; Thomas H. Donovan, Charles Peters, V. Monterichard, G. W. Brown and W. A. Newcom, of Jackson, directors.

The Iron Mask Gold Mining Company has incorporated at Spokane, Wash.; capital, $500,000; incorporators, P. Clark, W. J. C. Wakefield, A. Corbin, B. C. Kingsbury, Spokane; J. A. Finch, A. B. Campbell, Wallace, Idaho; H. L. Frank, Butte, Mont.

## A Recent Change in Name.

TO THE EDITOR:—In your map of mother lode of Calaveras, which at this time is very interesting and a useful reference, I wish to call attention that we have changed the name of South Extension Gwin No. 1 and South Extension Gwin No. 2. Both these claims have been purchased by our company and are now known as South Paloma mines.

The patents were issued under the old names, but I want, if possible, to have them known as South Paloma mines, in distinction and relation to North Paloma mine on the other side of the Gwin. MARK B. KERR.

South Paloma Mine, Jan. 26, '96.

MANUFACTURERS OF

## Stamp Mills, Ore Feeders

DETACHABLE BUCKET WIRE-ROPE TRAMWAYS,

Roller Grinding Pans, Desulphurizing Furnaces, Etc.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

**The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Setf-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.**

**FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.**

**SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.**

**THIRD: The Large Amount of Space Saved.**

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

30 and 32 FREMONT ST., SAN FRANCISCO.

## Spadone's Concentrator Belts.

**The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.**

Illustration Fig 1 shows a cross-section and Fig 2 shows the edge hanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or pots, a direct strain comes upon the top and at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We would like to call your attention to our Spadone Curved Edge* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

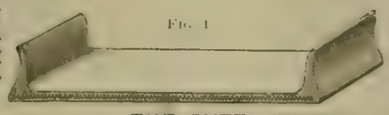

FIG. 1

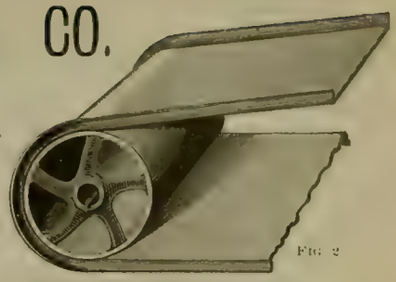

FIG. 2

**We shall be pleased to quote you also on Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING and RUBBER PACKING. Correspondence Solicited.**

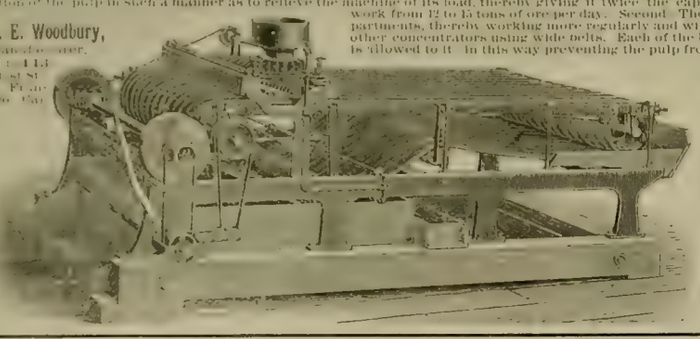
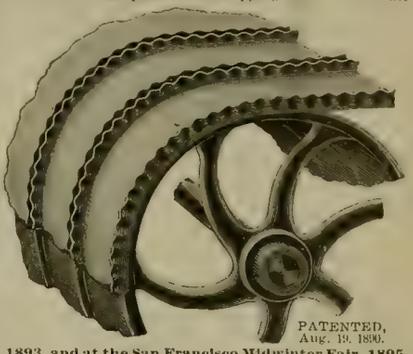
TELEPHONE, MAIN 1813.



## THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS



**was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891.**

MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other ore concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials.

The accompanying cut shows the belt in its improved form, which consists of corrugated edges to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS. First. The improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second. The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third. The belts run on a perfect line, needing no adjustment to prevent their running from side to side as to other concentrators. Fourth. The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth. The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth. The feed arrangement is perfect. Seventh. The machine is constructed of iron with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury,
Manufacturer,
141 to 143
First St.
San Francisco, Cal.

PATENTED, Aug. 19, 1890.

**This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1895.**

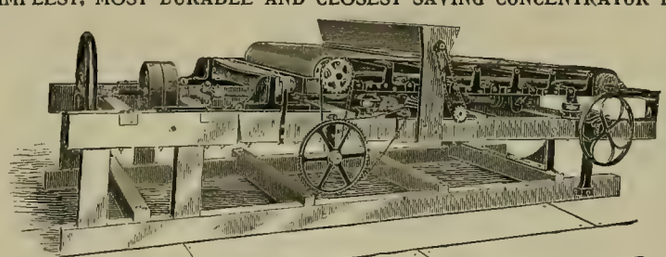
# The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.

NINETY-FOUR AND ONE-HALF PER CENT —SAVED— ON ORES DIFFICULT TO CONCENTRATE.



A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH

Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,

E. L. BALLOU, Propr. Ballou Reduction Works.

# Market Reports.

## The Markets.

SAN FRANCISCO, Jan. 30, 1896.

The iron and steel market is looking up. Being flat on its back, it couldn't do else. Lead is very weak. Copper does not exhibit the buoyancy of one year ago. Silver is steady. There are indications that justice will soon be done in Congress to the white metal and the interests of the country, which have suffered through demonetization.

The Treasury Department has ordered resumption of coinage of silver dollars, which will continue until about $18,000,000 have been coined. When the present Administration came into power there were in the Treasury about $29,000,000 in silver dollars coined from bullion under the act of 1890, and available for the redemption of Treasury notes issued in payment of the bullion purchased. Since August, 1893, about $18,000,000 of these notes have been redeemed in silver dollars and cancelled. The Secretary of the Treasury has now decided to coin from the bullion now on hand, and purchased under the act of 1890, about $18,000,000, which will restore the amount of dollars in the Treasury to what it was on March 4, 1893. The average cost of the silver bullion purchased under the Sherman act was 71⅓ cents on the dollar, which leaves a gain or seigniorage of 28⅔ cents on the dollar. At this rate the seigniorage on the $18,000,000 to be coined would be $5,130,000, which will be accounted for in the available cash on hand, increasing it by that amount.

Final figures on complete returns of the the production of pig iron in the United States for 1895 shows the largest output in the iron-making industry of the United States—9,446,308 gross tons, as against 6,657,388 tons in 1894.

## Mining Share Market.

SAN FRANCISCO, Jan. 30, 1896.

The market stiffened slightly on Friday and Saturday, only to go off on Monday and Tuesday, under manipulation and a strong bear pressure, but yesterday it showed more strength. The market acts very much as if there are factors at work which will create better prices before long. Evidently the powers that be are fighting to keep it down, but they may not be able to do so much longer. The people are unquestionably ripe for a deal, and with the least sign indicating that such a thing is possible, they will come in on the bull side. Their buying would of itself bring about better prices, owing to a scarcity of shares. The opinion prevails that outside holdings are large, but facts do not carry out such a belief. The absence of any and everything which would create a deal has been quite marked for several years past. Even extracting ore and rosy reports circulated regarding the mines failed to inspire sufficient confidence with traders as to cause them to operate. During this time those holding lines of shares have been steadily letting go, and to-day it is safe to assert that very few, comparatively, have any, and those that have do not carry much. Of course, these remarks apply to those who buy and hold for something big, for outside traders seldom hold long. They either sell on turns or else are turned out by their orokers, who are compelled to this course owing to their customers not responding to repeated calls for more margin. To where the shares have drifted is an open question, but in the absence of evidence that the public are not large holders, it would seem that the shares must have drifted into fewer hands. Even if this should be the case, unless these parties have large moneyed backing, it will be impossible to promote much of a deal in the absence of confidence on the part of outsiders. The election of A. G. Gurnett president of the San Francisco Stock Exchange has made a favorable impression, which is further strengthened by the members he has appointed on the different committees. It is asserted that, from their character and standing, much in the way of reforms can be expected. If the exchange redeems itself and sees to it that affairs be conducted on honest lines, then moneyed men will be more disposed to come into the market. Mr. Gurnett is an earnest advocate of honest methods and true business principles: he is also in favor of having paying gold mines in this State listed on the exchange. With that object in view, he has appointed a special committee on gold mining listing, composed of men of wealth and standing. It is reported that several of the largest dividend-paying mines in this State will be listed some time during the current year. This is a move in the right direction.

From the Comstock mines the advices are uniformly of a favorable character. While the work is not prosecuted with that vigor it should be, yet it is in the right direction. In several the work is largely preparatory, while in others it is going in the direction where ore is expected to be found. In the Alta group nothing is expected until after the Alta assessment is collected. It is quite freely asserted that ore can be found whenever it is advisable. But this kind of talk has been made for so many years it has become threadbare by age. In the Gold Hill group more attention is being given to the work going on, but from its character it may take some time before anything good will come of it, and in the meantime the Crown Point assessment will be collected and others be levied. These are very promising mines, yet they fail to materialize anything outside of assessments. The work in Belcher, Crown Point and Yellow Jacket, it is said, ought to show up something before many weeks pass. Perhaps enough can be shown up to attract buyers at higher prices, when shrewd dealers can get out, and the buyers left to carry the load. In Confidence and Challenge the work does not attract attention. The Con. Imperial management is a long time finding the ore struck last year in Challenge, but which was lost in the latter mine by some kind of shuffle. In Alpha the work is still of a procrastinating character. In the middle mines nothing new has developed, not even an assessment, but it is a moral certainty that the latter will be run into before long. The ore that is extracted does not meet current expenses. The work in two of these mines gains in interest as it is being prosecuted. In the north end mines there is nothing new to report. Our last week's remarks cover this week's advices. Notwithstanding this there are many bulls on the shares in this group. The work that is being done does not differ from that which has been under way for many months past.

The work on the Brunswick lode attracts some attention and that is all. The great expectations of dealers regarding this lode have not been realized and it looks as if it is still some time off. The trouble seems to be that the shares in the leading mine on this lode is not properly handled to inspire confidence. From the Bodie mines nothing new is reported. The managements are still pegging away, but not on the right levels yet.

The following illustrates the changes of the week:

| MINES. | Jan. 23. | Jan. 30. |
|---|---|---|
| Alpha | $ 21 | $ 20 |
| Alta Consolidated | ..... | ..... |
| Andes | ..... | 23 |

## A New Concentrator Belt.

The "Spadone" curved edge concentrator belt is the latest improvement in this line, and commends itself to the attention of mining and mill men with very reasonable claims to superior merits. These claims bear upon the flange, which is so constructed that it turns outwards while passing over the rollers or pulleys, thus relieving the strain from the top and bottom of the edge, directing it automatically to the inside face surface. This saving in strain and wear insures a much longer service for the belt than could be otherwise obtained.

The cuts, Figs. 1 and 2, which appear in the advertisement on another page, give a clear idea of the construction and action of the belt. It is manufactured to fit any size machine, from four to six feet width, by The Gutta Percha and Rubber Manufacturing Co., Nos. 30 and 32 Fremont street, San Francisco, from whom full particulars may be had upon application. *

# Assessment Notices.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 30th day of January, 1896, an assessment (No. 42), of 15 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, No. 22 Nevada Block, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of March, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 28th day of March, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

JNO. W. TWIGGS, Secretary.

Office—No. 22 Nevada Block, San Francisco, California.

JUSTICE MINING COMPANY. - Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of January, 1896, an assessment (No. 60) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 309 Montgomery street, Room 23, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of February, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made be before, will be sold on MONDAY, the 9th day of March, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. E. KELLY, Secretary.

Office—No. 309 Montgomery street, Room 23, San Francisco, California.

ALTA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Gold Hill Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of January, 1896, an assessment (No. 51) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of February, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 9th day of March, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. E. JACOBUS, Secretary.

Office Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

SAVAGE MINING COMPANY.—Location of principal place of business, San Francisco, California. location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the fourth (4th) day of January, 1896, an assessment (No. 88) of twenty cents (20c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 50, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the sixth (6th) day of February, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 26th day of February, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

E. B. HOLMES, Secretary.

Office—Room 50, Nevada Block, No. 309 Montgomery street, San Francisco, California.

WEST SIDE CANAL AND LAND COMPANY—Location of principal place of business, San Francisco, California. Location of Works, Fresno and Kings Counties, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 30th day of December, 1895, an assessment (No. 3) of one (1c) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 8, Floor 8, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of February, 1896, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 27th day of February, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. E. NAYLOR, Secretary.

Office, Room 8, Floor 8, Mills Building, San Francisco, California.

ANCHOR COAL AND DEVELOPMENT COMPANY.—Location of principal place of business, San Francisco, California. Location of Works, Kelso, Cowlitz county, Washington.

Notice is hereby given, that at a meeting of the Board of Directors held on the second (2d) day of January, 1896, an assessment (No. 6) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 632 Market street, Room 5, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the third (3d) day of February, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the fifth (5th) day of March, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. D. FARISH, Secretary.

Office, No. 632 Market street, Room 5, San Francisco, California.

# RUPTURE CURED.

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absolutely without danger. Usually but a single treatment required.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR WEEK ENDING JANUARY 21, 1896.

553,146 —SEPARATOR—Barnard, Moore & Atkinson, Seattle, Wash.
553,187 —DRAWBAR—J W Boggs, Huntington, Or
553,196 —DOOR FASTENER—A B Cammetti S F
553,210 —CURRY COMB—J Carden Carpinteria Cal
553,214 —TOOTH CROWN—C A Davis, Pasadena Cal
553,237 —RAIL STRAIGHTENER—W Hainsworth, Seattle Wash
553,248 —ROTARY ENGINE—S P Ingram, San Jose, Cal
553,252 —GAS ENGINE—S M Miller, Stockton, Cal
553,271 —FILTER—H L Ricks Eureka, Cal
553,278 —ROTARY ENGINE—J G Rosling Oakland, Cal
553,285 —CHUCK—G A Sholer, Spokane, Wash.
553,316 —MILK AERATOR—F C Stephenson Green Meadows Cal
553,271 —FRUIT SLICER—J H Stewart, Chico, Cal
553,307 —DOOR LOCK—E S Sutton, Snohomish, Wash
553,326 —BEER DRAWING APPARATUS—G Wil Hams S F
25,062 —DESIGN INSCRIPTION PLATE—E. K. Jones, Portland, Or.

NOTE.—Copies of U S and Foreign patents furnished by Dewey & Co in the shortest time possible by mail or telegraphic orders. American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ROTARY ENGINE.—Sterling P. Ingram, San Jose, Cal. No. 553,408. Dated Jan. 21, 1896. This invention relates to improvements in rotary engines. It consists essentially of a cylindrical case having annular piston chambers side by side; an axle shaft passing through the case with disks fixed thereto and pistons fixed to the disks in pairs so as to be carried around within the respective piston chambers; a transversely movable abutment is slotted so as to allow either pair of pistons to pass through it when the slot is in line with the piston chamber and is closable behind the rear piston. A steam chest has parts leading into the piston chambers upon opposite sides of the line of travel of the abutment, and a valve is fixed to and in unison with the abutment, having parts corresponding with those in the steam chest; a diaphragm separates the steam chest into two parts, in each of which one-half of the valve is movable, and by means of an inlet passage and valve, steam may be diverted to either of the valve chambers for the purpose of reversing the engine. Exhaust passages at the lower sides of the piston chambers correspond with the inlet passages, and a valve is provided whereby one pair of said exhaust passages is opened and the other closed upon each reversal of the engine. The inlet and exhaust valves are so connected as to be reversed simultaneously.

ROTARY ENGINE.—J. G. Rosling, Oakland, Cal. No. 553,428. Dated Jan. 21, 1896. This invention relates to improvements in rotary engines, in which a piston is revoluble within an inclosed annular case. It consists of an annular piston chamber, a central shaft with a disk fixed thereto projecting into the piston chamber, a suitably packed piston fitting in said chamber, abutments slidable radically, and mechanism driven from the shaft whereby the abutments are alternately reciprocated to the open chamber for the passage of the piston and to close behind it. Steam valves open into the piston chamber adjacent to the abutments, and exhaust ports correspondingly open outwardly from the chamber with controlling valves. A mechanism is connected with a cam fixed upon the engine shaft whereby the steam valves are reciprocated, and a second lever connects with the steam valve mechanism and with the exhaust valve mechanism so that the two are actuated in unison.

## WANTED!

### A First-Class Mechanical Man

**For a Chicago Engagement.**

Must be thoroughly competent and familiar with mining machinery.

Address, with references and salary expected, "CHICAGO," this office.

## ANGELS IRON WORKS,

**DEMAREST & FULLEN, Props.**

## Mining Machinery.

**ANGELS, CAL.**

Write for estimates on complete Milling, Mining and Reduction Plants.

## Notice to Artesian Well Borers.

I have here Artesian Boring Machines and I wish a competent man to work them. For particulars, address L. DUTERTRE, Golconda, Humboldt Co., Nevada.

# THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and Kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

**MINING AND SCIENTIFIC PRESS,**

**220 Market Street ... San Francisco, Cal.**

### *Assaying.—Part I—Gold and Silver Ores.*
Second edition. By C. H. Aaron. Embraces 120 12-mo pages with illustrations, well bound in cloth; 1889. Price, postpaid ..... $1 00

### *Assaying.—Parts II and III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.*
Latest edition. Contains 161 pages with illustrations and is strongly bound in cloth. Much of the original text is replaced by new matter. Price postpaid ..... $1 75

### *Assayer's Guide.*
By Oscar M Lieber. ..... $1 50

### *Assayer's Manual.*
By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition edited and enlarged by F Lynwood Garrison. Illustrated. ..... $3 00

### *Manual of Assaying—Gold, Silver, Copper and Lead Ores.*
By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo., 333 pp. Price, postpaid ..... $2 50

### *Notes on Assaying and Assay Schemes.*
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth ..... $3 00

### *Blowpipe Analysis—Manual and Qualitative.*
By F. M. Endlich ..... $4 00

### *A Practical Guide for Prospectors, Explorers and Miners*
By C. W. Moore. With numerous illustrations ..... $1 50

### *The Explorer's and Assayers' Companion.*
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid. ..... $6 00

### *Aaron's Leaching Gold and Silver Ores.*
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid ..... $3 00

### *Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.*
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid ..... $3 00

### *Modern Copper Smelting.*
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated ..... $5 00

### *Cyanide Process.*
By M. Eissler ..... $3 00

### *The Metallurgy of Gold.*
By M. Eissler. Profusely illustrated ..... $5 00

### *Losses in Gold Amalgamation.*
By W. McDermott and P. W. Duffield ..... $2 00

### *Electricity in Mining.*
By Sylvanus P. Thompson ..... 80 cts.

### *Practical Treatise on Hydraulic Mining.*
By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, postpaid ..... $5 00

### *Hydraulic Gold Miner's Manual.*
By T. S. G. Kirkpatrick. With plates and cuts ..... $2 25

### *Manual of Hydraulic Mining for the Use of the Practical Miner.*
By T. E. Van Wagenan ..... $1 00

### *The Coal Mines of the Western Coast of the United States.*
By W. A. Goodyear. 12 mo., cloth ..... $2 50

### *The Sampling and Measurement of Ore Bodies in Mine Examinations.*
Well printed on fine paper, with plates; complete. Price, postpaid ..... 25 cts.

### *Manual of Mining.*
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth ..... $4 00

### *A Text Book of Mineralogy.*
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth ..... $3 50

### *Manual of Determinative Mineralogy.*
With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth ..... $3 50

### *Practical Hydraulics.*
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid. $2

### *Metallurgy of Silver, Gold and Mercury in the United States.*
Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo ..... $7 50

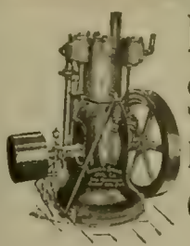
### *Metallurgy of Silver, Gold and Mercury—Continued.*
Vol. II.—GOLD. MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth ..... $7 50

### *Notes on the Treatment of Gold Ores.*
By Florence O'Driscoll. Associate Member of Institute of Civil Engineers. 8vo., cloth ..... $2 00

### *A Practical Manual of Minerals, Mines and Mining.*
By H. S. Osborn ..... $4 50

### *Machinery for Metalliferous Mines.*
By E. Henry Davies. Illustrated ..... $5 00

### *Matte Smelting—Its Principles and Later Developments, with an Account of the Pyritic Processes.*
By Herbert Lang ..... $2 00



### *Introduction to the Study of Metallurgy.*
By W. C. Roberts-Austen ..... $4 00

### *Practical Metallurgy and Assaying.*
By A. H. Hiorns ..... $1 50

### *The Practical Metal Worker's Assistant.*
By Oliver Byrne. Illustrated ..... $5 00

### *Mining Machinery.*
By G. G. Andre. Two vols ..... $15 00

WESLEY T. GORHAM. HADWEN SWAIN.

## Hadwen Swain Manufacturing Company.

## Gas and Gasoline Engines

For operating irrigation and drainage pumps, hoisting works and stamp mills, etc.

The strongest, most economical and most durable engines made.

Highest award at Mechanics' Fair, San Francisco, 1895.

**215 and 217 Spear St., San Francisco.**

## THE WILSON

HIGH GRADE STEEL

## SHOES —AND— DIES.

Guaranteed to Wear Longer and Prove Cheaper than any others.

**Made by use of Special Appliances.**

PATENTED AUGUST 16TH, 1892.

—Made only by—

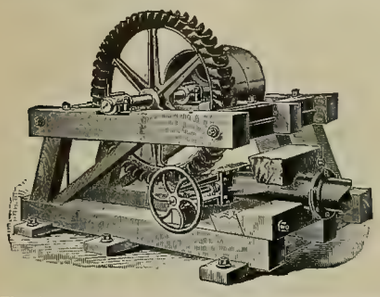
# FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.



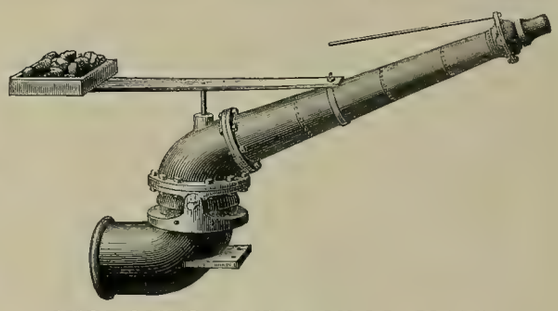
For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.
" " " Improved Belt Frue Vanner..... 600, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 600, f. o. b.

JAS. S. BROWNELL, Western Agent FRUE VANNING MACHINE CO.
(Successor to ADAMS & CARTER), 132 Market St., Room 15, San Francisco.

# RISDON IRON WORKS.

OFFICE AND WORKS, COR. BEALE AND HOWARD STS., SAN FRANCISCO. CABLE ADDRESS, "RISDON'S," SAN FRANCISCO.



The above cut shows the general arrangement of one of Knight's Standard Water Wheels, of which there are more than 450 in use in California alone. These wheels are made from 2 feet to 6 feet in diameter, from 10 to 1000 horse power, and adapted to all heads and purposes.
Descriptive circulars mailed free on application.

MANUFACTURERS OF

JOHNSTON CONCENTRATORS,
IMPROVED BRYAN MILLS,

## The Nevada County Electric Power Company's Dam in the South Yuba River.

This dam is located on the South Yuba river, about seven miles from Nevada City, Cal. It is a crib dam weighted with broken granite. An effort was made to dam the river at this point some three years ago; but the freshets coming before the dam was completed, it was carried out. In designing this dam, the intention was to have the construction such that, in the case of early freshets before the completion of the dam, no serious accident could happen to it. To attain this end, the river was cleared to solid bedrock and the logs bolted securely to bedrock. The inequalities of the bedrock, on the up-stream side of the bottom logs in the face of the dam, were then filled in with concrete, so that these logs are fairly buried in the concrete. The logs composing the various cribs were then bolted securely to each other, and, from each set of logs, bolts were carried back to bedrock. The dam was loaded with broken granite as the construction progressed. When completed, the dam, including the entrance to headgates, is 206 feet long on the top, 28 feet high and 40 feet in depth. The dam was loaded with about 9000 tons of broken granite.

DAM OF THE NEVADA ELECTRIC POWER COMPANY.

The first freshets filled the dam with slickens and fine gravel, and made the face of the dam perfectly tight. The work of constructing the dam was begun in the first week of September, 1895. A storm on the 10th of September carried out the temporary river flume and filled the dam location with gravel and debris, the removal of which caused a delay of about ten days. The dam was completed November 10, 1895.

During the late freshets there have been over nine feet of water over the crest of the dam, and none of the construction has been in any way affected. The dam is used to divert water into a flume 6 feet by 5 feet 4 inches, which is carried a distance of 18,340 feet, where a fall of 206 feet is obtained. A 48-inch pipe line conducts the water to a power-house, where two Pelton water wheels operate two 300 K. W. Stanley transformers, which generate a current at an E. M. F. of 5500 volts. This power will be transmitted to Nevada City and Grass Valley and to the mines in their vicinities for furnishing power and light. On January 26th water was run through the flume and full pressure attained at the power-house and a preliminary run made with the machines. The sub-stations at Nevada City and Grass Valley are complete, but the final starting of the machinery is delayed for a few days awaiting the arrival of station transformers. The plant will probably be put in permanent operation about February 12th. It is of present interest because of the general movement in the Sierra foothills of this State to electrically utilize the gravity force of the westward water flow.

Although the machinery of a number of mines in this State is operated by electricity, this is the first plant installed to supply power for a great number of mines, as well as for the lighting of two cities. The entire water-power plant is so designed as to allow the increasing of the generating capacity of 3000 horse power.

The engineers of construction of the company are William R. Eckart and Hasson & Hunt. The construction of the dam and flume was personally supervised by Mr. A. Tredidgo of Grass Valley.

## A Book for the Prospector.

It was recently stated in "Concentrates," on the third page, that a handy reference book for California prospectors would meet with ready sale. There are plenty publications intended for the prospector, but from the number of letters received, and from the comments in journals published in other mining communities, it is manifest that an addition to mining literature would pay in the shape of a plainly written practical little book that would be of use and value to the prospector and metal miner. Of course, nothing can take the place of personal observation and experience, and no one can learn much of geology or mining by solely reading books; but a compendium of generally known facts would save many a one weeks of toil, if nothing else, and would be a godsend to many a one who wants to start prospecting, but doesn't know how. Prospecting is not a business in which there is rivalry or competition, and old experienced prospectors are never disposed to sneer at "greenhorns" or "tenderfeet." It is a pursuit in which practical knowledge is a great help and saving, and a compilation of knowledge on the subject would meet with ready sale to those who know and those who don't, the former buying to increase their stock of knowledge, the latter to get some points as to what to do and how to do it. The book need not be a pretentious concern, full of technical descriptions and abstruse scientific discussion, but a small, compact condensation of up-to-date popular mineralogy, with a general application to prospecting and mining for gold, silver and copper; practical points of use to those in the field. Besides stimulating prospecting and doing considerable good, it would be a source of profit to its compiler. There are beginners in everything, and the thousands of beginners in the art and mystery of mining form a good field for present supply in that direction.

San Francisco, February 8, 1896.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Dam of the Nevada Electric Power Company, 101. The Homestake Mills, 105. Sectional View of the Woods Dry Placer Miner; The Woods Dry Placer Miner, 107.

EDITORIAL.—The Nevada County Electric Power Company's Dam in the South Yuba River; A Book for the Prospector, 101. Of Great Present Importance; The New Mineral Bill; Tramp Corporations; California Exposition in New York City, 102.

SCIENTIFIC PROGRESS.—A Giant Among Inventions; The Cold-Bend Test for Wrought Iron and Steel; Heat Influences Nerve Points in the Skin; Fruit as an Aid to Digestion; New Bread More Healthy than Cut Bread; A Balloon with Automatic Instruments, 108.

ELECTRICAL PROGRESS.—Acetylene Gas from an Electrical Standpoint; To Put In a Large Electric Plant in Mariposa County; A New Electric Lamp; Cementation of Steel by Electricity; A Scheme to Bring Power from Kern River to Los Angeles, 109.

MECHANICAL PROGRESS.—The Inspection and Testing of Materials; Gun Manufacture, 109.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 110-111.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 115.

MISCELLANEOUS.—Concentrates, 103. Mines, Miners and Monopolies, 104. The Butterfield Tunnel Scheme; The Homestake Mills; Ignorance of the Turks; Bottled Mineral Water, 105. Recommendations for Safety Appliances in Colorado Mining, 106. A Talk About Giant; Wooden Shoe Pegs Replaced with Platinum Nails; The Woods Dry Placer Miner, 107. Notes on Gold Milling in California, 108. Commercial Paragraphs; New Mining Incorporations; Coast Industrial Notes, 112. Notices of Recent Patents, 114.

LAST Monday, through the courtesy of Mr. Ford, now in Washington, we received an official copy of H. R. 4080, being the newest and latest mineral land bill, providing for the examination and classification of mineral lands in this State. It supersedes the "compromise" bill and is in every way acceptable to the miners and mining interests of California. It is the bill published in full on the editorial page of this paper in the issue of Dec. 21,'95, when extended editorial comment was made thereon, with slight modification as to the number of commissioners, which is increased. The bill was endorsed last Wednesday by the House committee on public lands, the California delegation is unanimously in favor of the measure, and the sub-committee of the House on mineral lands has reported it favorably. At this writing it is believed that Congressman Bowers will be able to report it to the House with a favorable recommendation from the full committee. President Neff, of the California Miners' Association, and other prominent members of the association, including the old mineral land committee, endorse the present measure, and it is believed it meets the wants and wishes of the miners of the State. The only difference between this measure and the one endorsed by the miners' convention last November is that that bill provided for the appointment of three commissioners; this one divides the State into four sections and provides for the appointment of three commissioners from each section. In some respects the new measure is an improvement on the "Idaho-Montana" bill endorsed last November, and it is in order for every one in any way interested in the outcome to forward by every means at their command the efforts of Mr. Ford and the California congressional delegation to have such legislation secured.

IN these days of tramp corporations, where the capital stock is ten million dollars and the amount subscribed is barely enough to pay the requisite incorporation fees, it is a pleasure to note the incorporation in this city of the Mayflower Gold Mining Company with a capital stock of $3,000,000, all paid up. The mine is at Canada Hill, Nevada county.

As the crowning glory of a forthcoming California exposition in New York City is announced the reproduction of a "'49 mining camp." Mute memories of the Midwinter fair make mental protest against such a hideous caricature and belittling of the State. The projectors of the show should be induced in some way to suppress the menagerie.

## Of Great Present Importance.

Twenty years of difference and discussion have not altered the present and pressing requirements regarding proposed Government aid in the Sacramento and Feather rivers. There has been considerable crimination and recrimination, and meanwhile the hydraulic mining industry of the State has been crucified. But 'tis useless to hold post mortems or discuss what is past. That should be left to the paid agitators of the Anti-Debris Association, whose salary ceases whenever the people most affected adversely agree to unite and secure aid instead of fighting those who want to help their neighbors and themselves. Things are as they are: we all, whether working in the valley or on the hillsides, propose to remain here, and it is puerile to keep harping forever on the causes of the present trouble. Of more effect would be concerted effort to overcome the present untoward situation.

Briefly, the facts are these: The Sacramento, Yuba and Feather rivers are obstructed. Disinterested and competent men distinguished for experience and ability, high in the Engineer Corps of the U. S., after careful personal examination and long study and observation, have three times sent official reports and recommendations to Congress that $300,000 be appropriated to begin a plan agreed upon and designed by the U. S. Engineer Corps for reclamation. In anticipation of favorable action thereon this State has made a contingent appropriation of $250,000 for the same work. Whenever Congress appropriates a like amount the State Treasury is unlocked and $500,000 is at once available. The recommendation of the U. S. engineers has all along met with favorable response; but now at the crucial moment, when the argument is all in and the matter has been fully discussed; when all that is needed is unanimity and acquiescence on the part of all concerned, a factious and implacable few who fear that their petty salaries as promoters of troubles and apostles of discontent will cease oppose the only favorable chance for aid that can possibly be utilized. Their opposition will be seized upon as an excuse for inaction by a Congress that, for political reasons, wants to make a record for economy, and the present miserable muddle will continue. These valley residents are aided by a few newspapers that for a variety of reasons find pleasure and profit in opposition to the effort for the common good and seek to convey to Congress the idea that such opposition correctly reflects public sentiment. At best, California's influence in securing needed Congressional appropriation is weak; when small, and then divided, the probabilities for success are greatly lessened. Not a single California Congressman is on the Ways and Means Committee, the River and Harbor Committee, the Mines and Mining Committee. At best the fight is a hard one; the opposition referred to makes the fight still harder. In the 53rd Congress a $100,000 appropriation passed the Senate, but was defeated in the House. Eastern and Southern Congressman with no great interest either way said: "Well, we hear from members of your California Anti-Debris Association that they don't want this money appropriated; and if you people can't agree, we do not feel like voting public money away." The same excuse will be heard in the 54th Congress if the same opposition continue. The ostensible reason or excuse for this valley opposition is "we are opposed to Government aid to hydraulic mining." There are many good logical reasons why Government aid should be given the hydraulic mining industry of California as a matter of business, apart from reciprocity or justice; but waiving all that, it is plain that the senseless opposition displayed by the Anti-Debris Association has different reason for its existence, or at least must make different plea. About all there is of this association is its Executive Committee, that is run by men whose salary depends upon their activity. These men say that they are opposed to any work being performed under the direction of the State of California or the United States except done as designated by them, and under no consideration will they consent to the construction of dams in the streams. Here is where their inconsistency is most conspicuous. No money is asked for the hydraulic miners. They are faithfully and patiently complying with the provisions of the law. The Government engineers in '93 and '94 made recommendation that restraining works be constructed at Government expense by building a wall or dam or restraining barrier at Deguerre Point, in the Yuba river, above Marysville. In making this recommendation, these Government engineers say that such work is not intended to facilitate future hydraulic mining, but to restrain former accumulations of debris; they assert that the sole idea is to aid in solving present difficulties regarding overflow in the Sacramento and Feather rivers, yet this measure is attacked and opposed on the ground that "it furnishes Government aid to the hydraulic miners," when the U. S. engineers, disinterested and impartial, officially say it does not, and the opposition to it comes from the very men most benefited by the measure.

These men have prepared and forwarded a new scheme of their own, creating a new U. S. Commission and carrying an appropriation; and though they know they have not the slightest chance to pass the measure, or even have it favorably considered, they declare that that measure of theirs, and that alone, shall receive their support, and any other bill, however meritorious, will be strenuously opposed by them. They know that Congress never makes appropriation of a dollar for such work except upon the official recommendation of U. S. engineers; they know that such recommendation was twice made by the U. S. engineers regarding the project now favored by the miners; they admit that that project was agreed to, acquiesced in and favored by themselves in the convention of the California Miners' Association four years ago when all these matters were fully discussed; but with strange fatuity and perverseness, they continue to say "we will now oppose any such proposition."

Meanwhile their interests and those of every one else are retarded and prosperity destroyed by such opposition.

The right of these people to change their minds is conceded; they are no doubt self-justified in retracting their former adherence, in opposing what they formerly favored and in seeking to ruin where they cannot rule. We look beyond them, however, and appeal to the public opinion of the Sacramento valley. It is within bounds to say that if the present foolish opposition of a few factious fighters continues, it will destroy any probability of success in this Congress for measures in which the people of the Sacramento valley are vitally interested. The miners have acted in good faith throughout; they are acting in good faith now; they have faithfully followed the provisions of the Caminetti act, and were it not for that act there would now be no opportunity to do much of practical avail in the way of present necessary legislation. The present project has received Government sanction; it is the only project that has or can. Why continue to encourage by silence or money contributions the men who are to-day the worst foes of the valley—the men who, because desirous of holding petty positions, are willing to sacrifice their neighbors?

This is a matter of tremendous importance to the valley. It is folly to assume that hydraulic mining in California can be stopped. Every dictate of business suggests a wider policy; the horizon is a broader one than that viewed by those who oppose the present movement. Take the city of Marysville, the home of the most bitter opponents of the measure we advocate. We have personally known of heavy taxes there for over twenty years to keep up a necessary expensive levee system; of yearly requirements in the way of removing obstructions to navigation in the Yuba and Feather. A few miles up the Yuba from that city are millions of cubic yards of deposits, the result of mining many years ago at Smartsville and Timbuctoo. Near Deguerre Point, eight miles above, these deposits are sixty feet deep; they are continually moving down stream. They are a constant expense and menace to Marysville. Five years ago a commission of Government engineers described all this to Congress after personal examination, and recommended an appropriation for a restraining dam at Deguerre Point; three years ago Cols. Mendell, Heuer and Benyaurd, the three U. S. engineers of highest rank and longest service here, made similar recommendations; two years ago the same disinterested and impartial examining board renewed that recommendation. The question of hydraulic mining does not and did not enter into

the matter at all. It was and is solely a question of preservation of valley residents in and around Marysville. Yet, hoodwinked by the specious arguments of a few who see their salaries disappearing, the very people in and around Marysville to be benefited by the proposition now before Congress oppose it and favor beginning all over again by the introduction into Congress of a bill creating a commission "to inquire into the condition of the rivers," etc. Was ever seen such fatuous folly!

There isn't the slightest chance of their bill passing, but were it to go through to-morrow, and every governmental wheel greased to utmost expedition, it would be four years before they could get matters in as favorable shape for national legislation as they now are. There is a constant clamor, and a just one, from the valley that the Government take charge of this matter of reclamation and river improvement. Yet, now when an opportunity exists to start such Government work after twenty years talking about it, a few followers of discontent jump up and demand that the whole thing be begun over again. They find allies in the Sacramento Board of Supervisors and the Sacramento papers, which take delight in opposing any measure of relief for corporate reasons not necessary to here dilate upon.

The sole excuse proffered by these obstructionists is a fear that compliance on the part of the Government in the report of the Government engineers will be taken advantage of by the hydraulic miners. This fear is unfounded; such excuse or reason has no cause for existence. The California miners have always acted in good faith, and they could not, even if they would, mine by hydraulic process in the region under discussion except under the provisions of the Caminetti act, which protects the valley residents by provisions uniformly observed. This is not a question at all relating to hydraulic mining; it is a matter of self-preservation to valley residents, and any attempt to divert thought from that point in arraying antagonism that should be allayed is but a specious plea for continued obstruction and delay.

Present stress is laid upon present damage occasioned by the recent great rainfall, when, as a matter of fact, the present condition of much of Yuba, Sutter, Yolo and Sacramento counties is due to causes that the proposed national legislation can best obviate and most quickly remove.

Congressman Johnson's bill to create a Sacramento River Commission has not the slightest possible show to pass the present Congress. The measure that went over from the 53rd Congress has. It should be the province and purpose of every dweller in the region affected to aid in the passage of this measure to which Congress is practically pledged. The only mutually satisfactory work ever done in this regard has been that accomplished by the U. S. Debris Commission under Federal direction. It is of prime importance that that Commission be empowered to continue such work of supervision; it is equally important that proper appropriation be made for the maintenance of that Commission. The original appropriation for the creation and support of that Commission will be exhausted in a few weeks. Prompt, united and harmonious effort is needed to secure national legislation that will result in mutual good and aid in satisfactory settlement of the problem. Stolid opposition, change of front and appeals to prejudice must result disastrously to all. We appeal to the mistaken Sacramento and Marysville opponents of the present measure to consider the gravity of the case, to realize the great importance of the situation, and to withdraw their opposition to the only bill that can afford them protection or relief.

This intestinal strife should cease. Were every hydraulic mine to close down to-morrow and stay closed for the next century the regular winter rains would still annually fill and overflow the river beds. If we all act in unison we can do some good. The only effective way is to stop wrangling and work together. The miners and those representing the mining interests want to help the valley residents. It is at least in order for the valley residents to want to help themselves. The first necessity, if they do, is to disregard their self-constituted leaders and do some thinking for themselves. Let them not forever look back. The whole question has advanced. All we ask is that those interested will stop shouting long enough to allow a fair, just presentation of the matter to Congress, with due regard to their interests. Frantic appeals to prejudice should have no weight with sensible men. If the present honest effort to get this great matter properly before Congress for final solution and permanent relief should fail the blame will lie on those who are now mistakenly opposing the very plans most conducive to their own prosperity.

## Concentrates.

JANUARY disbursements on the Comstock aggregated $69,-239.66.

THE Colorado Springs, Colo., mining exchanges are about to consolidate.

THE roadway for the Iron Mountain railway, in Shasta Co., is completed.

THE daily 100-ton capacity of the De Lamar, Nev., mill is being doubled.

TRINITY RIVER was higher during the recent storm than it had been before since 1861.

THE Calaveras *Chronicle* of Oct. 20, 1860, announced that eighty mills were crushing quartz in Calaveras Co.

IF all the "proposed" smelters are built there will be a supply of facilities in that respect fully equal to the demand.

THE present monthly coinage of the San Francisco mint is about $3,000,000. It has a monthly capacity of over $5,000,000.

THE Gold Mining Exchange of this city has completed its organization, appointed its committees, and is now ready for business.

THE Virginia *Enterprise* says: "Nearly twenty families have left the Comstock for Butte, Mont., since the beginning of the year."

AS in White Pine, Nev., in '69 and '70, and at Leadville, Colo., in '79 and '80, pneumonia is now reported to be cruelly fatal at Cripple Creek, Colorado.

TO-DATE the rainfall in this State has been just about what the miners want; a little too much of a good thing in some cases, but plenty everywhere for all purposes.

LOCAL PAPERS say that under the proposed management the Boise City, Idaho, Mining Exchange will be more of a detriment than a benefit to legitimate mining in Idaho.

THE La Candelaria Mining Company is about to increase its capital stock from 2688 shares of the par value of $1000 each, or a total value of $2,688,000, to 268,800 shares of $50 each—a total value of $13,440,000.

IN the construction of the Mountain mine smelting furnace at Keswick, Shasta Co., over 150,000 pounds of iron and steel has been used; the reducing capacity of the smelter will be 200 tons of ore each 24 hours.

AT Coulterville, Cal., this week, P. Matsen, an employe of the Merced G. M. Co., met a terrible death by falling 200 feet in a chute, about fifteen tons of rock being dumped thereon before the accident was discovered.

BETWEEN Salton lake and station, San Diego Co., and Yuma, nearly 500 mining men and prospectors are reported in the mountains locating gold mining claims or preparing to erect mills to work gold-bearing quartz already located.

THE trial of John Hays Hammond began at Pretoria, South Africa, last Wednesday. He was formally accused of having openly avowed opposition to the Transvaal Republic. The trial was adjourned, and he was liberated on bail.

ON Nov. 3, 1860, the MINING AND SCIENTIFIC PRESS offered $2500 reward for a "mode or process of separating the gold from the sulphurets as found in the mines of this State." On Dec. 1, 1860, the amount of the offered bonus was increased to $5000.

THERE are six mills at Murray, Idaho, running seventy stamps, as follows: Golden Chest, twenty stamps; Mother Lode, ten; Yosemite, ten; Daddy, ten; Golden King, ten, and the Jenkins claim, ten, all of which are reported to be making money.

THE new woman is in evidence in Denver, where Mrs. Mary E. Phelps has organized a woman's mining company. She says "no man on earth shall own one share of stock." The board of directors are all women. It is probable, however, that as work progresses men will be found necessary.

IF the miners working in the Winthrop mine, near Ishpeming, Mich., get out 18,000 tons of ore this month, they will be paid $3 a day and the wages of other laborers will be advanced proportionately. This will be a return to the wages of four years ago. Some of the men at the Lake Angeline property earn $75 a month.

DAILY REQUESTS for back numbers of this paper are filled. This week came from Arizona and British Columbia requests for copies issued in 1862 and 1864 respectively. The MINING AND SCIENTIFIC PRESS of those days is interesting reading. The 1862 numbers of this paper contain a complete history of the mining, mechanical and industrial progress of this coast since May, 1860.

IN the present House of Representatives there are five miners. Speaker Reed has seen fit to keep all Pacific coast Congressmen off any committee having anything to do with mining. There are in the present House three civil engineers, thirty-eight manufacturers and twenty-seven editors. There are also 233 lawyers, fourteen college professors, forty-one farmers, twenty-five bankers, and two insurance agents.

THE Rollins lead mine, Lincoln mining district, Beaver county, was the first mine patened in Utah. It was located in 1859, and consisted of 3,000 linear feet by 100 feet in width, the maximum allowed under the then prevailing laws. Locators were then permitted one claim of 200 feet for discovery and one by pre-emption, and subsequent locators one claim of 200 linear feet upon the same ledge.

ATTORNEY-GENERAL FITZGERALD is of the opinion that State Debris Commissioner J. F. Kidder is entitled to compensation for actual work performed only, and that he is not entitled to appoint a secretary until such work begins, as the act which creates this office provides that the State must give an appropriation of $250,000, to be met with a like appropriation by the United States Government for the purpose of restraining dams.

THE Virginia, Nevada, *Enterprise* says: "Mr. Frank Sharon recently was on the Comstock in the interest of the Corral Hollow Coal Co., which is situated near Stockton. The Corral Hollow Coal Co. is about to erect extensive works, and Mr. Sharon came to examine the new Yellow Jacket hoisting works, with a view to purchasing and removing them to Stockton. Mr. Sharon also examined a large steam shovel at Dayton, the property of the Carson River Dredging Co., with a view to purchasing that also for the same company. It is understood that Mr. Sharon will report that the machinery at the new Yellow Jacket is much larger than the requirements of the Corral Hollow Coal Co., and that the expense of moving the cumbersome castings would be too great. It is understood, however, that an offer was made for the works which may possibly be accepted. Mr. Sharon made a favorable report on purchasing the steam shovel at Dayton."

JOHN DISTELHORST of Siskiyou Co. is in this city, having built one of the dredging machines of which he is the inventor, which, upon his return, will be placed in the Klamath river. A large part of Klamath river, from Beaver creek down, has been secured by the Distelhorst brothers and a number of their bedrock scrapers will be put to work in the spring. Four of the dredgers were operated in the upper Sacramento river last season, one of them cleaning up about $20,000.

THE Sacramento Board of Supervisors has received a letter from Congressman Barham in reply to resolutions sent to the California Representatives respecting the bills introduced in Congress relating to hydraulic mining, in which he desires the navigability of the rivers maintained and the interests of the farmer preserved, and adds: "I think it is the duty of the Government to construct dams, impound the debris and do all things necessary to allow the mines to be fully operated."

AS ON THE COMSTOCK, where Virginia, Nev., is mined and undermined, so in Butte, Montana, where a company having for its object tunneling under the City of Butte has been formed by C. H. Palmer, J. A. Coram, L. Merrill and other stockholders in the Butte and Boston Mining Company, which will drive tunnels under the entire city, it being their opinion that rich copper and silver ores are directly under the city and that Butte is built over mineral deposits richer and larger in extent than those of the Anaconda.

A ST. LOUIS, Sierra Co., Cal., subscriber writes, asking that "Concentrates" decide a bet. "A. claims that a boy who supports himself can locate mineral land. B. claims that nobody but a citizen of the United States twenty-one years of age can locate mineral land." A legal friend who is authority on those matters makes reply as follows: "Locations of minerals upon the public domain are confined exclusively to citizens of the United States, but in this matter a corporation is considered a citizen, and so are a woman and a minor, and they may each make valid locations."

IN the case now on trial where the Carson City G. & S. M. Co. sue the North Star M. Co., Nevada Co., for $825,000, value of ore alleged to have been removed from plaintiff's ground, Judge Beatty, in the U. S. Circuit Court in this city, holds that defendant may introduce its U. S. patent as evidence of its extra-lateral rights in the matter. Incidentally Judge Beatty holds that a patent furnishes conclusive evidence of facts involved, without prejudice to the legal questions involved, and that under the law an owner of contiguous mining claims can include all his purchased locations under one patent.

UTAH'S LEGISLATURE is about to create a State Mining Inspector, who must have practical knowledge of the modern methods of working, ventilating and timbering mines, and an experience of at least three years in mining in the mines of Utah. He shall examine the condition of the mines, inquire into the causes of accidents, if necessary require the owners to provide against recurrence of such accidents, examine the condition of all machinery, the methods of timbering the workings, the manner of ventilation, supervise the storage and care of explosives and is forbidden to reveal any information concerning the character of ore bodies, under penalty of a fine not exceeding $500.

THE wholesale incorporation of colossal "mining companies" in Cripple Creek, Colorado, is so great that the *Mail* in publishing the column lists of them shows unusual disregard of the dignity usually conferred by capital letters, the dollar mark, the names of the distinguished incorporators, the scene of their proposed operations, the honored site of their offices, etc., but bunches the business this way: "manchester g & m co 10,000,000" "metropolitan g & m co 2,000,000" "gold stamp m co 2,000,000," and so on by the dozen. The idea of dismissing the advent of a $10,000,000 company or even a $2,000,000 company by a brief abbreviated lower case bobtail "manchester g & m co 10,000,000!"

THE Denver *Republican* of the 30th ult. represents California as being "jealous" of Colorado, and that the recent enterprising efforts at gold production in that State have aroused a spirit of "rivalry" here. Not at all. There is no "jealousy" in California; rather a pleasure in the knowledge that Colorado has so bravely weathered the recent financial stress. As for "rivalry," there exists none but a friendly determination to keep in the lead of gold-producing States. Gold mining is the one business on earth in which there exists no business "jealousy" or "rivalry," for there is no competition; the product is eagerly sought by the customer, and there is no present fear of overproduction or want of consumption.

DURING the week the U. S. Circuit Court of Appeals has made a modifying decision in the case of Austin Walrath, appellant, vs. the Champion Mining Co. This litigation regarding two adjoining mines in Nevada Co., it will be remembered, resulted in the lower court in favor of the Champion Mining Co., reported in full detail at the time. Judge Ross now decides as follows: The opinion of the lower court, in so far as it limits the extra-lateral right of the complainant to follow the vein called in the record the back or central vein in its downward course, is erroneous. It is conceded that whatever right the complainant has in or to the ledge in controversy is derived from the act of May 10, 1872, embodied in the Revised Statutes as section 2322. Unless that ledge has its top or apex within the lines of the surface of the location of the Providence claim the complainant has no extra-lateral rights to that ledge at all. But that it does have its top within the surface lines is an uncontroverted fact and was so found and adjudged in the court below. The complainant, therefore, has the extra-lateral right conferred by the statute, which is the right to follow the dip of the ledge in its course downward outside of the vertical side lines of the surface location of the Providence claim wherever it goes until it comes to the vertical planes drawn downward through the end lines of the location continued indefinitely in the one direction. Beyond those points of intersection the extra-lateral right did not go. In no case can the extra-lateral right of a first locator in respect to a vein, lode or ledge, having its top or apex with the lines, be bounded by the side lines of the surface location extended downward or otherwise.

## Mines, Miners and Monopolies.

Written by J. A. EDMAN.

NUMBER IV.

As determined by customs and practices based upon the fifty years' record of gold mining on the Pacific coast; from the letter and spirit of legislation up to the present day; from the etymology of the term and its universal acceptation in this country, the words "mineral land" must be taken as denoting an inherent and intrinsic quality, not dependent on time or on external conditions, and expressed in other words as "land containing mineral" and, as a necessary distinction, as "land containing useful minerals." Land containing mineral must always contain it until exhausted by industrial processes or the ever active forces of nature, and this fact remains whether abundant mineral was discovered previous or subsequent to a land grant. To limit by time of actual discovery, or qualify the term in degree by amount of mineral or by relative value of product, is as impracticable as it is absurd, as will appear by applying the same reasoning to agricultural land. Under such construction much of the land of the Sacramento valley, which by nature may be sterile and has not been improved by the hand of man, should be classed as "desert land" and be amenable to the laws affecting such land. The ultimate values of mineral land when improved depend upon conditions so manifold and various that they cannot be formulated by any human laws; the estimate even of what would constitute profit differs so widely that such a rule of definition would be absurd; the estimate of profit by the laboring man striving for an existence and working his small claim in a mountain ravine, can furnish no comparison with that of the wealthy owner of a large and well-developed quartz or hydraulic mine. Who then shall say that the former should lose his all, while the latter should have accorded him the full protection of the law?

To except minor portions in the interior of a mineral belt as agricultural because profitable mines are not in evidence thereon would be as absurd as to proclaim as mineral land such portions of the Sacramento valley where profitable farming is not prosecuted. Its absurdity becomes patent where the even-numbered sections within a land grant are accepted as mineral, while beyond the section line the land identical in mineral and geological character is, on the belief of a railroad land agent, taken to be agricultural land. The only logical basis for a segregation must rest upon geologic character, by observing which the outward boundaries of a mining belt may be established, and all within it be classed as mineral land, for it is an established fact that within the before-mentioned metamorphic schists and associated igneous rocks constituting the main gold belt no area of a square mile can be found without evidences of valuable mineral in veins or in gravels. The relative value of mineral land should be estimated not only from its actualities but from its potentialities, to greater extent than the values of farming lands are so estimated. In a country where land fit for tillage is comparatively cheap and abundant, the State can have no pretext for or derive any benefit from allowing mineral land to be occupied and held as agricultural. The reverse practice has obtained in some of the older countries, where a belief in the importance of free lands for mining has led to the enactment of laws allowing the entry by the miner upon private land, under certain conditions, as in Germany and Scandinavia, and the general practice by nearly all the older governments of jealously guarding the mineral lands of their public domains.

That the prosperity and expansion of mining, specially in the noble metals, are dependent upon free land is fully proven by the records of history both in the Old and the New World, and never more so than during the period subsequent to the Spanish conquest of America. It was due to the wise mining laws and regulations in force for some centuries, even more than to the innate energy and boldness of the old Spaniards, that the gold and silver mines of the Spanish-American colonies reached such marvelous development, and yet to this day, after nearly four centuries of successful exploration, present vast and promising fields to the miner. The Spanish policy was to preserve the mineral land to the miner, subject to a tax to the Government, and large holdings were discouraged and made impracticable. Even the largest of the grants made by the Spanish crown bear but an insignificant proportion to the grants made to the railroads in the United States. As a result, good placer mines yet abound within the Spanish-American countries, although the wise policy of Spain has of later years been set aside by the present rapacious and unstable governments of Central and South America, as well-as by Mexico.

That private ownership of large tracts of land is inimical to gold mining is strongly evidenced in this country by the relative insignificance and slow progress of gold mining in Virginia, Georgia, North Carolina and Alabama, although many of the mineral areas of these States offer in the gold values of their ores fully as great promise as our southern gold belt. To come nearer home, we have striking evidence of the incapacity of wealth alone to wisely develop large tracts of mineral land and make them productive in the records of the Mariposa land grant and the Natoma grant at Folsom, the former rich in gold-bearing quartz veins, the latter covered by auriferous gravels; yet what are their products in gold to-day contrasted with that of similar areas free and open to the miner?

Another potent factor in national development, which in these days of inflated speculation, of corporate greed and power, and of popular worship of wealth, has been almost lost sight of, is the rights and the capacities of the individual as contrasted with the demands, the privileges and the abilities of associated capital. In gold mining more than in any other class of mining, individual skill, exertion and energy are essential to success, and in no department is this more called for than in prospecting, by which term the exploration of new mines is generally implied. Without skilled prospecting there can be no expansion in gold mining, no new mines found to take the place of those exhausted or abandoned. But even in old mining fields the services of the prospector and explorer are needed to discover resources overlooked or neglected during the flush periods of mining. The prospector's life is so full of hard work, of privations and of dangers, that the promise of wages alone has for him no allurements; he longs for freedom and hopes for some splendid reward for his labors, and he shuns the land over which some non-resident speculator or owner claims title or control, or from which the railroad land agent tells him to move on. These true pioneers of mining are every year becoming rarer in California, but are now found in the lead in the new States and Territories, and it is to them we owe the development of Alaska's gold resources as well as Arizona's, the extension of civilization in the Arctic as well as in the Torrid Zone.

The prevalent delusion that capital alone is omnipotent has led to innumerable disastrous schemes in agriculture as well as in mining, all in disregard of the confirmed experience of nations that small holdings of land, both agricultural and mineral, are one of the safeguards for the true prosperity of a country. Admitting all the proper uses and benefits of capital in mining, it has frequently signally failed of results in California from lack of the individual skill, energy and integrity which ownership chiefly engenders and fosters. In parallel lines with the superior production of small farms, individual miners or small companies have been more successful in California than the larger mining corporations, and this becomes most evident in a higher percentage of product from a given area of land or amount of material treated, as large and rapid operations, specially in gravel mining, disregarding apparently trivial details, often entail enormous waste. Even in quartz mining, where capital can be applied to great advantage in perfecting milling and metallurgical operations, the absence of individual skill and probity is constantly causing waste and loss, generally unknown or guarded against in smaller operations.

The so-called old and worked-out mines of California, both quartz and gravel, present this day the most inviting field not only to the investor but to the working miner, and in this field alone, in which he writer has had a large experience, profitable employment can be found for twice the number of miners now employed in California, if possessed of some skill and energy. This field, as well as our virgin lands, is becoming every year narrowed for the purposes of mining, while offering no appreciable quota to the wealth or well-being of the State when so withdrawn or claimed for other uses.

In its permanent effects upon the prosperity and welfare of the people, the policy of the British Government in relation to mines and gold mining has been in marked and favorable contrast to that of our own, and as a result we find yet in Australia, as well as in British Columbia, the largest part of the mines operated by individuals or small partnerships, and scarcely any instance where property rights are at the mercy of a greedy corporation. The unwise departure from this sound policy in the British possessions in South Africa, caused by the grants to the South African Company, has already brought its natural consequences and will no doubt soon find its correction in the common sense of the English people, and will have reached a solution long before our own long-suffering citizens will rise in their strength against their oppressors.

In the British colonies the miner deals directly with the crown, represented by a Commissioner of Mines, and his license, lease or patent fully protects him; the American gold miner is not recognized by the General Land Office or his mining property protected by the Government until he applies for a patent, and even when this is issued, after great expense and vexatious delays, he is not safe against the attacks of the railroad corporations, as the records of our courts bear witness. It is this absence of official recognition, denied the citizen but lavishly accorded to the corporations, that has laid at the root of the just complaints of the miner, and has enabled the land-grant railroads to control the situation. This recognition should be had immediately and be fully defined by statute, and should take its inception from the time when a mineral location is made and put on record, and be fully established and shown on the records of the General Land Office when one hundred dollars' worth of labor or improvements had been made on a mining claim and had been properly certified to the local land office. The perfecting of title by proceedings for patent should be optional as now, or if the costs and difficulties of procuring it were reduced, may be made obligatory within a certain number of years, for instance five years. In this simple way full evidence of mineral character would always be available, and the promise of our Government in opening the public land for miners would be honestly fulfilled. The question may be asked, Why do not miners patent their claims? The answer to this is that in many instances the expense is prohibitive, and the involved and impracticable rules in force, magnified in importance to the mind of the unlettered citizen, makes it necessary for him in nearly every instance to employ a professional attorney instead of dealing direct with the local land office or a Government agent, as should be provided by law. The cloud thrown upon a valid title to any mining claim within land-grant limits by the pretensions, however unfounded, of the railroad companies has largely been instrumental in preventing the exploration and development of mines thereon, as was evidently the purpose and policy of the corporations. This, while apparent everywhere, is most evident within the main gold belt.

The physical conditions of the main belt are to a great extent reproduced in the northern gold belt. Its topography is still more rugged and irregular, and, excepting the portion adjacent to the railroad, its means of internal communication are scant and inferior. With the exception of some valleys in the coast division, nearly the whole area is covered by high mountains, cut by deep and almost inaccessible canyons. Its eastern half rises above the winter snow line and averages over 4000 feet in altitude, reaches at many points over 7000 feet and culminates at Thompson's peak with 9100 feet, while on the eastern edge of the belt Mount Shasta lifts its snowy summit 14,500 feet above the sea. Except along the coast, the climate is even more rigorous than in the northern portion of the main belt. Much of its eastern half is covered with snow for many months, and even the railroad, penetrating its fastnesses along the deep cleft of the Sacramento river, is frequently impeded and blocked by snow and snowslides. Practically the only arable land contiguous to the railroad is in the volcanic region east of the road, of which a comparatively small part is known as mineral; beyond this but a few small, elevated valleys and basins west of the railroad offer but a subsistence to the farmer or dairyman. No low and gently rolling ridges reach here into the milder climate of a semi-tropical valley as in the main belt; the aspect of nature is rough and inhospitable, but in wealth of mineral it rivals if it does not exceed the best now available land of the main belt. But even here, among the snow-covered and almost inaccessible mountains that tower some thousands of feet above the railroad in the region west of the line and within its land-grant limits, the far-seeing eye of the Southern Pacific land department has discovered vast tracts of agricultural land on the odd sections, and the areas where the expert surveyor can scarcely find a foothold are now to be found described at Washington on the lists of land selected by the company, certified to by the railroad agents as agricultural and accepted as such by a more than complaisant Commissioner and a compliant Secretary of the Interior, in spite of the remonstrances of the Miners' Association. The lands thus wrongfully sought to be absorbed are situated in Shasta, Trinity and Siskiyou counties, and comprise some of the most valuable vein and placer mines of California.

The southern gold belt differs so much from those described in climate, topography, geology and conditions of development as scarcely to be comparable with the other gold belts, except perhaps the portion within San Diego county. In this belt the mineral areas are often intersected or concealed by evidently agricultural land. Exploration has done but little to develop its resources, and among the chief causes of that condition the numerous private land grants scattered over its western half is most prominent. Peculiar climatic conditions and the resulting light rainfall have also retarded the development of its mines. In the northern portion the Tehachapi, with the San Gabriel and San Bernardino ranges, contain most of the mineral land, while that of the Coast Range within the southwestern part of San Diego county approaches nearest to the physical features of the main belt.

But even this region, blessed with so many and varied natural resources, has not escaped the curse of railroad land grants, which, added to the incubus of the old Spanish grants, bids fair to prevent any extended development or great economic benefit from its mineral resources. Viewing the map of southern California, with the broad belt of Southern Pacific grants depicted thereon, the question will naturally arise whether it was accident or design that caused the serpentine folds of the land grant conferred by a generous Congress thus to enfold

within its limits the best mineral land of this belt, as well as some of the fairest agricultural land of California.

The Great Basin mineral belt, as being comparatively little explored and in most of its extent happily exempt from the land-grant curse, need not here be particularly discussed.

Meadow Valley, Cal, Jan. 25, '96.

*(To be Continued.)*

## The Butterfield Tunnel Scheme.

Written for the MINING AND SCIENTIFIC PRESS by ALEX HYSLOP.

One of the most daring mining enterprises ever undertaken in Utah, and one which presents many unique features, is the big tunnel of the Butterfield Mining Company, which has crosscut at nearly right angles for a distance of 8200 feet the formation of the south end of the Oquirrh range, in which the famous mining camp of Bingham, Utah, is located. Other important tunnel schemes have been inaugurated in Utah, and some have been carried through to completion, notably the big drain tunnel of the Ontario, which is over three miles in length, but where the Ontario tunnel was run to tap the lowest workings of the mine at a depth of 1500 feet below the neck of the shaft, the Butterfield tunnel can be more properly designated as a prospect hole. The Ontario tunnel tapped the lowest workings on the vein of that property, but the lowest workings on any of the veins crosscut by the Butterfield tunnel is more than 1000 feet above the level of the tunnel, and the greatest depth reached under the surface by the Butterfield tunnel is 2200 feet.

The tunnel was started with hand work in February, 1892, and in August of the same year Ingersoll - Sargeant drills were put to work, a Rand compressor which obtained its power from a thirty-six inch Pelton wheel, run by the stream of Butterfield canyon, having been erected at the mouth of the tunnel. In order to provide against shortage of water a steam engine and condenser were also provided, but since the tunnel attained any depth the flow from the formation has been sufficient to preclude the possibility of a shortage of water. From the time the drills commenced working the tunnel has made a record in underground work that has probably never been excelled. For 400 days succeeding August 11th, 1892, the average daily run of the tunnel was 13.39 feet, but when this depth was attained the average commenced to decline, and when work was suspended last September had decreased to 11.40 feet per day.

The tunnel is 5x8 feet in size, with a waterway under the track two feet deep and three feet wide, so that for every four driven forty-six feet of formation were removed, and on the maximum runs about 616 cubic feet were mined and discharged every day. The exact altitude of the mouth of the tunnel is 6000 feet above sea level, the grade is five inches to 100 feet; the gauge of the track is nineteen inches, laid with steel rail weighing sixteen pounds to the yard, the track being placed to the right-hand side of the tunnel to provide space for the two air pipes and the water pipe for the drills, which in this tunnel are laid on the ground, instead of being suspended from the timbers, as has been the practice in most such enterprises. The air pipe is of sixteen-inch galvanized steel. The pipe that carries the compressed air for the working of the drills is five-inch Kalomine with a lock joint and a leaded flange every sixty feet, and the pipe that conveys the water to the drills is one inch. This receives its supply from the outside, being connected with the source that supplies the Pelton wheel for the machinery, and which is 440 feet higher than the mouth of the tunnel. In addition to the machinery mentioned, all of which is run from the power obtained from the Pelton wheel, the company has a 110-volt dynamo, which furnishes light for the office buildings and the power house, but as yet the light has not been introduced into the tunnel. The latter, however, is provided with telephonic communication from the face to the mouth, with two intermediate stations. Horses are used for hauling the loaded cars out of the tunnel, and one animal pulls sixteen cars of a capacity of 3000 pounds each.

This remarkable work was undertaken by Mr. George W. Keel, the manager of the Butterfield Mining Company, who was assisted by A. P. Hanson, a civil engineer of Utah. The tunnel is on a right line through its entire length of 8200 feet, and so true has been the line that daylight is in view from the face of the tunnel. The work was commenced in blue lime, which after a few hundred feet changed into porphyry, and then quartzite, which was again succeeded by porphyry. At a depth of 3000 feet the white lime commenced to come into the formation, and continued for a distance of 1000 feet in the tunnel, to be followed by porphyry. At this point the ledges began to be in evidence, and ore of the same character as the croppings on the surface was encountered. The vein of the Lucky Boy mine, in Black Jack canyon (which property does not belong to the Butterfield Company), was cut on its regular dip of 35 degrees that had been indicated by the upper workings, but at a depth of 1000 feet lower than any previous workings on the mine. It is also proper to state that the tunnel was run through the mountain at a point considerably to one side of the end lines of the Lucky Boy, so that there is no chance for litigation on the score of cutting a vein that the tunnel company did not own. The next vein to be cut was that of the Queen, the title of which lies in the Butterfield Mining Company. The upper workings showed this vein to have a dip of 45 degrees, and where it was intersected by the tunnel this dip was maintained, and in addition the character of the ore was identical with that of the upper workings, more than 1000 feet higher. The ore of the Queen is in the form of ruby silver, running from 700 to 1000 ounces and higher, and it is not only remarkable but is a setback to those who always maintained that the veins in the Oquirrh range had no depth and no values, that the ore in the vein of the Queen cut by the tunnel is of the same character as that extracted from the upper workings and that the values are the same.

After passing the Queen vein, the tunnel again got into the porphyry, before it reached the ground of the Northern Chief, another of the properties owned by the Butterfield Company, and the vein of which has not yet been cut. It will have been noticed that the difference between the dip of the Lucky Boy and the Queen veins is ten degrees, the latter being more near the vertical. The vein of the Northern Chief is much more nearly vertical than that of the Queen, and it is expected that when it is cut in the tunnel it will be much closer than it is where it crops out and has been worked in the upper workings. This gives rise to the theory, which Mr. Keel admits was one of the reasons that actuated him in undertaking the work of running the tunnel, that the veins of the Black Jack side of Bingham tend toward one common source, and as the journey is prosecuted toward the north the relative position of the dip changes, first to the vertical and subsequently to a line almost at right angles with the original dip.

When work was suspended in the tunnel its face was in porphyry, and the established flow of water was in the neighborhood of 1200 gallons per minute, although at times, when some new feature of the formation was encountered, the flow has risen to as much as 5000 gallons, and has swept everything out of the tunnel on more than one occasion. The question is asked, why the enterprise should be brought to a standstill just at the time when the tunnel was commencing to do some good, and was tending to the drainage of the mines on the Bingham side of the range. Mr. Keel himself admits that the dyke porphyry that he is now in is, in his belief, the main dyke of the range, and that when it is cut, the waters that have troubled the Old Telegraph in its deeper workings, the Spanish, Utah, Niagara and South Galena mines, will drain off, and pumping will be discontinued. It may be that this is the reason to be assigned for the suspension of work, and that the Butterfield Company do not propose to drain the properties of other companies without recompense. If this is the real reason (and no other is apparent, as the Butterfield Company is not in lack of means) it is to be regretted that the various companies cannot enter into an agreement that will be satisfactory to all concerned.

The tunnel project is important in more than one sense, and its ultimate ends have not yet been mentioned. In addition to cutting some strong veins at great depth, it has demonstrated the existence of those veins at a depth that has frequently been declared impossible by some of the best mining authorities that are operating in that region. More than that, it will be a working tunnel for all the mines on the north side of the range, which are among the heaviest producers of the district. The flow of water from the tunnel has increased so that almost unlimited water power can be obtained, and when the enterprise is completed it is among the probabilities that the output through Bingham will go via Butterfield; that large concentrating mills and electrical plants will be erected on the Butterfield side, and that the total output of that vast region known as Highland will go through the tunnel of the Butterfield Mining Company.

THE HOMESTAKE MILLS.

## The Homestake Mills.

The engraving on this page of the Homestake mills, for which we are indebted to the courtesy of the Black Hills *Mining Review*, has little out of the common to distinguish it from thousands of similar constructions in the country. It is interesting mainly as the mill of the old reliable Homestake, owned largely in this city, and which last week paid its 120th dividend, making a total of dividends paid of $5,748,000.

PERHAPS there is nothing that so clearly explains the intense ignorance of the Turks as the fact that the Censors of Turkey prohibit the importation of all educational books, this state of affairs being brought about in one book by the discovery in one book of the formula $H_2O$, which the wise men of the court interpreted to mean: "Hamid II is naught—a cypher—a nobody.—Digest of Physical Tests.

ALL bottled mineral water—artificial as well as natural—have been found by a German pharmacist to contain bacteria. The waters are mostly germ-free, when taken from the earth, the bacteria being introduced by carelessly washed bottles, corks, etc

## Recommendations for Safety Appliances in Colorado Mining.

From Harry A. Lee, Commissioner of Mines for Colorado, is received Bulletin No. 1 of the Colorado State Mining Bureau, containing recommendations for safety appliances in mining in Colorado:

The bill establishing the Colorado Bureau of Mines provides that the officers of the department "shall inspect and determine the safety of devices and methods used in mining" * * * and "take necessary measures to make them safe." * * * "On receipt of notice * * * shall enquire into the cause of accidents." "Shall exercise sound discretion in the enforsement" of the act; shall give notice of any defect or practice found "to be dangerous," and "order the same to be remedied." It further provides a penalty for non-compliance with such orders and imposes a mandatory duty, viz.: "Any owner, agent, manager or lessee having charge or operating any metalliferous mine, whenever loss of life or serious accident shall occur connected with the workings of such mine, shall give notice immediately and report all facts thereof to the Commissioner of Mines." In the belief that all mine operators desire to strictly comply with legal requirements; to avoid fatal accidents and throw every safeguard around their employes, Commissioner Lee makes sundry recommendations:

*Explosives.*—Explosives must be stored in magazine provided for that purpose alone, to be placed far enough from working shaft, tunnel or incline to insure their remaining intact in event the whole stock exploded.

All explosives in excess of amount required for a shift's work must be kept in the magazine. Under no conditions will the storage of powder in underground workings where men are employed be permitted.

Each mine must have a suitable device for thawing powder and keeping it in condition for use. The water or steam bath is the only absolutely safe device. By a water bath is meant the surrounding of the vessel containing the powder with another vessel containing water which can be kept at desired temperature. The thawing of powder with dry heat is unsafe. Dry heat, under the most favorable conditions, may exceed a temperature of safety.

Miners should not be permitted to carry powder in their boot legs or elsewhere about their person. A suitable place or places should be provided for preparing charges. At these points there should be a box or cupboard for caps and fuse. This should be securely fastened and so arranged that the caps cannot be jarred out or anything fall into the caps. A cap-crimper should be attached to the side of the cupboard with a small chain.

*Oils, Candles, Etc.*—The storage of oils, candles and other inflammable substances demand the erection of a house for that purpose and at a safe distance from the main buildings. They must not be stored with the explosives. Their removal for use, like the explosives, should be only in such quantities as are necessary to meet the requirements of a day.

*Fire Protection.*—All plants using steam, and especially small ones where boiler, engine, blacksmith shop and shaft are all under one roof, must have a hose and hose connection to injector or feed pump and keep same ready for instant use. The line of hose should be sufficient to reach the farthest point of the plant. As a rule the water supply in small plants is limited and safety is largely dependent upon quick action. A few hand grenades hung about the plant in convenient places are great safeguards and should be indulged in. Heating stoves placed in shaft houses should receive even more care in safety equipments than is common in dwelling houses.

*Timbering*—Next to explosives, inadequate timbering causes more fatality than anything about a mine. The general inclination is the use of too frail and few timbers. No rule can be fixed for use of timber: the conditions must be met as they arise and economy in timbering lies in doing well what is done. Strange as it may appear, taking districts as a whole, the best timbered mines are the most inaccessible and above timber line, and the poorest timbered mines are those located in the woods. Temporary work which endangers life is criminal, and mine operators who supply their timbermen with material below the standard asked for assume very grave responsibilities.

*Code of Signals.*—1 bell—hoist (when not in motion); 1 bell—stop (when in motion); 1-1 bell—lower; 1-1-1--1 bell—with care—hoist (man on); 1-1-1--1-1 bell—with care—lower (man on).

Other signals to meet individual demands can be arranged, but the code in full must be plainly printed and placed in the engine-room, at the collar of the shaft, and at each station or level, together with a notice and penalty for wrong or improper signals.

Wrong or improper signals should be treated vigorously. An employe ascending upon one bell or descending upon two bells should be discharged. In mines working more than one level, signal gongs or speaking tubes should be placed from level to level. The danger of an employe signalling the engineer without first knowing the location of cage or bucket is apparent. Where more than one level is being operated, special signals from lower to higher levels should be established. When established, the stopping of an up-going cage or bucket should be abolished. To illustrate this point: A. signals to hoist from sixth to second level; as cage or bucket passes fourth level, B. stops it. The engineer is at a loss to understand; before executing one he has received another order. Let this be repeated several times and he becomes nervous. A rattled engineer is a dangerous attachment. It should be borne in mind that one bell does not mean "hoist until stopped," but "hoist to surface." Down-going buckets or cages are always "slowed down" at each level, and can be stopped with impunity, but on up-trips no one knows what signal is being obeyed and should not interfere.

*The Bell Line.*—The bell line should be so constructed that signals can be sounded clearly and easily from any station. This essential device is much neglected and should receive more attention. A few iron shieve wheels or rollers so placed that the line will stand clear of timbers is often all that is required.

At stations or levels where the line is used from both sides of the shaft, an attachment should be made so that reaching across the shaft for the line is unnecessary.

*Hoisting and Lowering Men.*—The hoisting or lowering of employes with a cage or bucket should be permitted or positively prohibited. If permitted, a notice must be posted near collar of shaft, stating the maximum number who may use cage or bucket at one time. This limit is not jeopardized when the men go "on shift;" but, unless fixed, may be exceeded at the end of the day's work.

The handling of men with a bucket is very dangerous, and its use is discouraged by this department as much as possible. To issue an order stopping the use of the bucket for handling men would, at the present time, work a hardship in some districts upon both the miner and mine owner. But should the work of the bureau demonstrate the necessity, action will be taken and the practice stopped.

It is to be hoped that the next Legislature will enact a law compelling all new enterprises to use a cage in shafts 200 feet deep and over.

A strict compliance with the section of this bulletin entitled "Daily inspection" will be demanded of all mine operators hoisting and lowering employes.

*Dump Guards.*—At the end of each dump track, when a car is used, there should be a device to prevent the car going over, whether the load clears or not. It is generally supposed that a trammer can let go, but records show that, while some do, the majority go over the dump with the car.

*The Shaft Collar.*—The shaft collar must be covered and so arranged that persons or foreign objects cannot fall in the shaft. When a cage is used, a bonnet, which raises with the cage and falls back to place when the cage goes down, must be arranged. This bonnet or shaft cover need not be tight beyond what would stop a small animal from falling in; but the cage in turn must be supplied with a steel bonnet, oval in shape, if solid, and if divided in the middle and hinged at the sides to admit sending down long timbers, the angles of the sides must not be less than 45 degrees, nor the steel less than three-sixteenths of an inch thick.

When a bucket and wooden doors are used, the shaft must be housed in and covered with doors which stand at an angle not less than 45 degrees pitch, hinged at the lower corners and opening upward or outward. These doors should not be less than four inches thick.

*Stations.*—All stations should have a passageway around the shaft, so that crossing over the working department can be avoided. Where flat doors are used, a guard rail must be kept in place across the shaft and in front of the level, so that it will stop anyone walking or pushing a truck or car into the shaft.

Across the track at some convenient distance an obstruction should be placed, so that cars or trucks cannot run by it and into the shaft, or trammers push cars by without removing same.

*Sinking Shafts.*—Shafts equipped with mechanical appliances must be of at least two compartments and the timbering kept well up with the work.

When sinking and work upon levels above are being prosecuted at the same time, especial care must be taken to protect men in bottom of shaft by placing close-fitting and strong doors in the working compartment and covering the ladder compartment with a plat, which will insure protection.

*The Ladder Way.*—All shafts over fifty feet in depth should be divided into at least two compartments, and one compartment set aside for a ladder way. The ladders should be sufficiently strong for the purpose demanded, and in vertical shafts should have landings at not more than twenty feet apart. The landings should be closely covered, except an opening large enough to permit the passage of a man, and the ladders should be so arranged that by no means could a person fall from one ladder through the opening to the next ladder. The ladders should be firmly fastened and kept in good repair. In incline shafts the landings should be put in as above described, but a straight ladder on the incline used.

The ladders in "upraises" or "winzes" from level to level should be likewise provided and kept in repair. Winzes and upraises are, after abandonment, very essential for ventilation, and, in case of accident, very essential as a means of escape. Just so long as they are necessary for the one cause and needed for the other, they should be kept in repair and ready for use, if required.

*Mill Holes and Winzes.*—All winzes and mill holes running from level to level should be covered or surrounded with guard rails, so that persons walking along cannot step or fall in. Winzes, as a rule, are upon one side of the main drift, and usually timbered a few sets above the drift level. Guard rails are easily placed about these. Mill holes, on the other hand, are often in the center of the drift. These must be securely covered with a door and kept covered.

*Exits, Ventilation, Sanitary Condition.*—As soon as practicable, all mines should have double or triple exits. Levels driven each way from the shaft must be connected by upraises or winzes, equipped with ladders and kept in good condition. These connections aid ventilation and provide exits or means of escape in case of accident. Connections from first levels to surface should also be made, unless underground connection is made with adjoining properties.

Proper ventilation is of such vital importance to mine operators that it is well looked after, as a general rule.

The sanitary condition about mines should receive careful attention. The use of abandoned stopes or drifts for closets should not be tolerated, and, where meals are eaten underground, the scattering of scraps and refuse matter about levels or stopes should not be permitted.

At the isolated mine boarding-house, arrangements should be made for the disposal of slops and refuse matter. It should be the duty of the foreman in charge to look well to the sanitary condition of the bunk-house and the cleanliness of his men. A large proportion of the miners are cleanly, but some are not, and a few filthy men injected into a bunk-house soon infect the whole, or cause the cleanly men to quit rather than submit to the filthiness of his enforced associate. The condition of a bunk-house is almost a sure index to the class of men employed. A cleanly and orderly condition predicts a thrifty, wide-awake and healthful crew and vice versa.

*The Indicator.*—Upon all plants handling men the engine should be supplied with a positive indicator. By a positive indicator is meant a device that is geared positively to the drum shaft and moves a target or indicator just as certain as the revolution of the drum raises or lowers the bucket or cage. Indicators arranged to move a target by the use of a string or wire cannot be depended upon, and are not as safe as marking the cable with a hemp wrapping or paint.

*Mine Visiting.*—The desire of persons to go underground, unaccustomed to mines and mining ways, should be discouraged. It is a novelty—an experience to relate to friends at home—but an experience in which the dangers are little appreciated, and of which it may be truly said, "Ignorance is bliss." Were it within the province of this department to say who should and who should not enter mines, the line would be drawn sharply and no one but employes or those having business would be admitted. Such a law would meet the hearty approval of all large mine operators, who appreciate the danger, trouble and expense to a company to be courteous, while the superintendents of smaller mines, whose better judgment is often overcome by a desire to please, would gladly take refuge and not assume the risks entailed.

*Underground Surveys.*—Each and every mine should keep an accurate plat of underground workings and have same brought up to date at least once a month by competent engineers. No greater false economy can be practiced in mining than working upon the supposition that those in charge know just where drifts are. Where mines are adjacent, or working upon the same vein, and water is encountered, the necessity is apparent and imperative.

*Boilers.*—The bill creating the office of State Boiler Inspector makes mandatory provisions regarding the care of boiler or boilers, and necessary reports to inspector. It further provides severe penalties for failure to comply with requirements. Mine operators using steam or other pressure should familiarize themselves with this law and its mandates, and thereby insure the safety of all concerned.

*The Mechanical Plant.*—In the equipping of a mine with machinery, safety is too often sacrificed to false economy. When the expense of stops and repairs are taken into consideration, the very best machinery of a given capacity to be had, regardless of first cost, is the cheapest. It is well to bear in mind that competition in the mechanical line is so close that skilled labor, iron and steel, have a fixed market value, and that in accepting a plant of a given capacity from one firm, because its bid is $500 or $1000 cheaper than another firm, the purchaser is

simply buying that much less material or skill, and endangering the success of his enterprise.

*The Mine Superintendent.*—The duties and responsibilities of a mine superintendent cover a scope of requirements unequaled in any other professional calling. One of his most important duties is the formulating of a set of standing orders, the compliance with which will insure the safety of all under him. Fatal accidents can be too often traced to lack of mine discipline. Laws governing the employes about a mine should be as inexorable as in the regular army. Let the fact become established that failure to comply with regulations, however trivial, means loss of position, without recourse, and the safety of all concerned is almost assured.

*The Mine Foreman.*—The mine foreman is practically the working superintendent, and upon him devolves the detail of practical mining. The welfare of his employers and the safety of their employes is largely dependent upon his good judgment, and he must of necessity be a thorough miner, a good timberman, and a fair mechanic.

*The Engineer.*—Too much care cannot be exercised in the choice of this officer. His responsibilities are grave and his work more wearing upon the nerves than the muscles. His cargo travels an invisible track and must be guided by hearing and feeling. Safety demands that his whole senses be on the alert and concentrated on his work. His surroundings should be comfortable in a room by himself, and under no circumstances should he be permitted to converse with visitors while his engine is in motion. A law should be enacted compelling all engineers to undergo an examination, grading them by certificate according to ability. Engineers upon mines who handle men should all carry first-grade certificates.

*Daily Inspection.*—All properties using mechanical appliances should be thoroughly inspected and reported upon daily. Some one man should be detailed to perform this duty at a given hour and make a written report. These reports should be filed and show that proper precautions are being taken. His duties should commence with the engineer, who will report the condition of the boiler, engine, cable, fire apparatus, etc.; then commencing at shieve wheel and testing all bolts and nuts on boxes and gallows frame, the cable fastenings and all things connected with cage, bucket, doors or bonnets; descending shaft slowly, examine the bell line, timbers, lining boards, stulls, skids, rollers, guard rails at stations, doors, etc. He should also ascertain the amount of powder and condition of warmers. Ascending shaft by ladders, the same care as to details should be exercised; also the condition of winzes, upraises and ladder-ways kept open for ventilation and exit in case of accident.

The observance of this provision will prevent accidents and prove economical. It does not debar those in charge from "keeping their eyes open," but they are less apt to see danger than one whose especial duty it is and whose position is dependent upon not overlooking it. This inspection can be made in comparatively short time and at a time not to discommode the working of the mine.

Most of the important requirements of the Colorado mine official are observed in the mines of California. The bulletin as published herewith carries its own comment and is an interesting addition to current mining literature.

## A Talk About Giant.

Giant powder plays fantastic tricks and smashes things sometimes on the slightest pretext. The citizens of Butte, especially, says the *Inter-Mountain*, should have a venerable respect for its powers, but unfortunately "familiarity breeds contempt" in this as in other things, and distressing accidents occur.

The greatest danger with the explosive is when it is too old or too new. In giant over a year old the glycerine in it is liable to crystallize after that time and the presence of a crystal in a stick of powder makes its handling dangerous. A scratching of that crystal, a jar of the stick or a rubbing of one stick against another is likely to produce an explosion. The best powder is that about six months old. Before that time the glycerine is almost too soft, and a new danger comes when it is being warmed for use. It is considered necessary to soften the powder before firing, in order to get the best services from it.

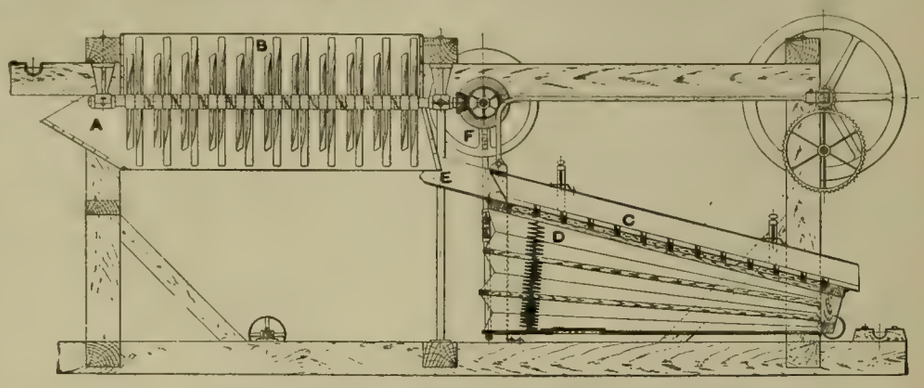
There is danger of getting new powder too warm and melting the glycerine. A drop falling an almost imperceptible distance will at once explode and its concussion will be enough to explode all. Giant will burn up at times without exploding, but the starting of a single drop of the glycerine it contains, either by exciting the crystal when it is too old, or the melted drop when it is too new, is what does the mischief.

A careful miner working on prospect work will sit by the fire with the powder near him, where he can watch it and note its condition constantly and work a stick in his hands, until it is mellow enough to suit him; then take another and go through the same operation, until what he needs for shooting the holes of his shift is warmed to his satisfaction. Then, if the weather is cold, he places the stick down his bootleg, so that the flesh will keep it warm, and go to work. It is out of the way in the boot and in less danger of being struck there than it would be in any other part of the clothing.

The boot is the usual receptacle for the powder, and few miners going from the cabin to the prospect hole will carry it in any other place. In the pocket there is danger. If the boot is too tight, which is not probable, the miner will place it under his shirt, rather than trust to dropping it out of his pocket.

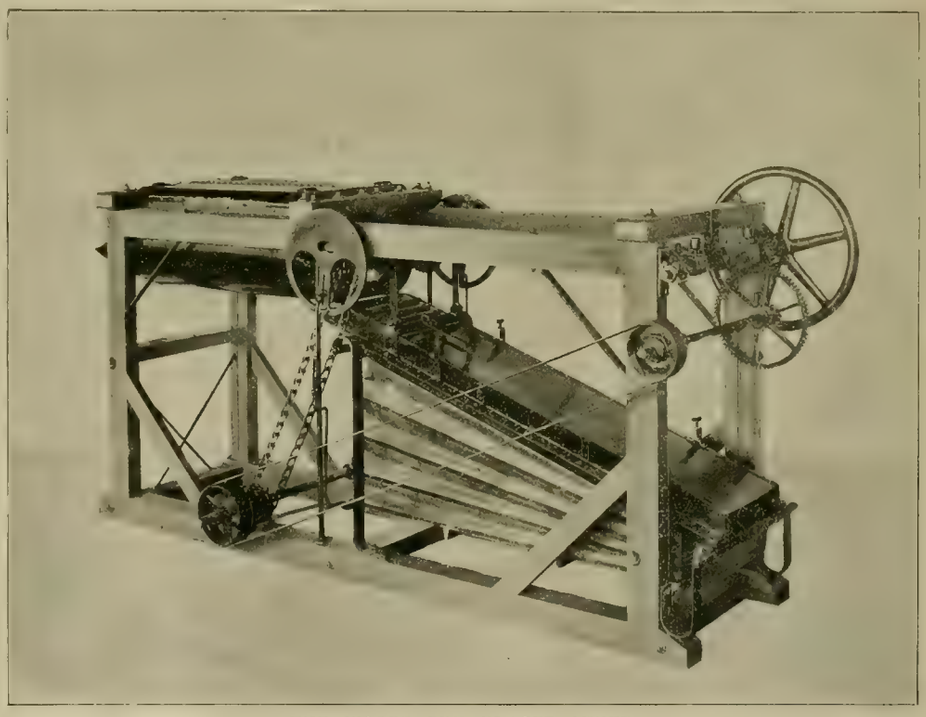
Many mine accidents come from picking out missed holes. Now and then it happens that the miner has in some way failed to load his hole properly. The fuse may not have been properly attached to the cap or the cap may have been pulled out of the cartridge by the tampering bar and failed to explode the powder. One of a dozen possible things may have happened to make it a "missed hole." Something must be done to get out the cap and the powder that the hole may be reloaded and this something is the most dangerous work the miner undertakes. If he is careful and takes time to draw out the charge with his "spoon," a long scraper that reaches to the bottom of the hole, he can generally get all out without damage, but too often he goes at the work roughly and loses an eye, a hand or the top of his head as a penalty.

Carelessness in loading, indifference in picking out the hole, combined, have made cripples and filled camp graveyards all over the mining country, and carelessness in handling and warming powder has done much to contribute to the dangers of the work. Neither frequent accidents nor the sight of companions mangled beyond recognition appears to have any beneficial effect in reducing the number or exciting miners to greater caution. The State has done what it can by law to reduce the danger, but it remains a matter of individual caution and care for each man who has the handling of powder in any form.



---

A LONDON paper, known as *To-day*, informs its readers that the soldiers in the German army have wooden shoe pegs replaced with platinum nails on account of the extreme lightness of this metal, which the newspaper says is as light as leather. A reference to "Curtman's Chemical Lecture Notes" shows that platinum is 22.1 times as heavy as water.



## The Woods Dry Placer Miner.

This dry placer machine is claimed by the manufacturers to be effective in the treatment of placer ground. The method presented may be readily followed by reference to the accompanying illustrations.

The ground is conveyed by scrapers to a platform placed over a hopper at the lower end of a charging elevator, and is dumped into a grizzly or screen, which lies level above the hopper, and any boulders that may be left upon it are readily removed by the man in charge. From the hopper the material passes to the elevator or conveyor, which is of the double chain or link bolt and pan type, and is carried up and falls into the feed hopper (*A*) of the disintegrating or pulverizing cylinder of the machine proper. The disintegrator or pulverizer (*B*) consists of a cylinder containing two horizontal shafts arranged side by side and parallel to each other, each shaft carrying a number of beaters, the blades of which are set at an angle something like the blades of a propeller. The shafts carrying these beaters revolve in opposite directions, so that the material is not only pulverized by the impact of the blades, but is also carried forward continuously towards the table of the machine. The disintegrator thus feeds the material in a constant and uniform stream to the table on which separation is effected. This table (*C*) is inclined and forms the upper part of a bellows (*D*), the whole thing being suspended on flat steel springs, allowing a shaking or panning movement, which is imparted by means of side rods with eccentrics upon a shaft, the rods being so bent as to permit ready access to the sides of the table for cleaning up. The table consists of a plate of perforated metal, forming the top or upper frame of the bellows, and upon it is placed a layer of carpet or cloth of such texture as will allow air to pass through without permitting any particles of pulverized material to drop into the interior of the bellows. Copper riffles are placed at intervals upon the diaphragm of cloth or carpet, and extending across the table. These are secured by means of side boards provided with clamping screws so that they can be

SECTIONAL VIEW OF THE WOODS DRY PLACER MINER.

THE WOODS DRY PLACER MINER.

readily removed for cleaning up. The table is covered with a sheet steel slide, leaving about six inches space above its surface. The material, leaving the disintegrator at (*E*), passes to the table, over which it is distributed and borne downward towards the tail end of the machine, assisted by pulsating blasts of air from the bellows. The vibrations of the table cause the larger and lighter particles to find place at the top of the stream of material, the blasts of air from the bellows force the fine sand and dust up and out of the machine, and the fine gold gravitates downward, settling on the cloth back of the riffles. The gold is thus saved, while the light, coarse gangue rolls down the incline, over the riffles, and is discharged as tailings. A leather flap valve is placed across the table at the upper end, so that while allowing the material to pass from the disintegrator to the table it prevents the dust from coming out at the feed end of the machine. The bellows is worked by means of a connecting rod and disc crank (*F*), the crank disc having a slotted hole to receive the crank pin, so that the stroke of the bellows may be adjusted, regulating the blast according to the fineness of the gold. The tailings pass from the machine to an elevator or conveyor similar to that employed at the feed end, and are thus carried out of the way, either to a car or directly to the dump. A clean-up should be made at least once a day, and may be accomplished by stopping the machine, removing the dust cover and carefully taking out the riffles. The concentrates that have accumulated behind the riffles are collected by the use of a common brush. Commencing at the top, they are brushed down the incline into a receptacle placed to receive them.

Fraser & Chalmers, corner Union and Fulton streets, Chicago, Ill., are the manufacturers. The claim is made that the machine will handle material not dry, provided the moisture be not sufficient to cause it to clot, and that it will save gold from magnetic black sand quite closely without any means of removing magnetic particles.

## Notes on Gold Milling in California.

NUMBER XII.

By E. B. PRESTON, M. E., Field Assistant State Mining Bureau.*

TYPICAL CALIFORNIA GOLD MILLS.

As the details in milling practices of the several counties of the State vary greatly, the following typical mills have been selected to indicate the practice under varying conditions:

No. 1. *Amador County.*— The ore is a soft, easily crushed quartz, with about 1½% sulphurets, and is largely mixed with slaty material, which, to the extent of 25%, is found mixed with the concentrates. The stamps weigh 750 lbs. each and drop 6 inches about ninety-five times per minute, discharging through a No. 8 slot screen, at the rate of 2½ tons per stamp in twenty-four hours. The stamps drop in the following order, 1, 2, 3, 5, 4, Nos. 1 and 2 having ½ inch more drop than the other stamps; in the adjoining battery the order is reversed. Iron shoes and dies are used. There is an inside plate used in the battery, which retains about 75% of the amalgam. The apron is 48x13 inches, set on a grade of ⅜-inch to the foot, and the double sluices below are 9 feet long by 14 inches wide, with a grade of 1½ inches to the foot. From these sluices the pulp passes to vanners. To clean the sulphurets from the slaty admixture, a cradle, 12 feet long, 20 inches wide, and 4 inches deep, has been placed in the mill, run by an eccentric. The dirty slimy sulphurets are taken from the washing-boxes beneath the vanner and placed in a half barrel standing on the floor of the mill, into which a hose is lowered, and the sulphurets are raised from the barrel to the cradle by creating a vacuum, through a small jet of water under pressure forming an ejector. The pulp in the cradle is stirred vigorously toward the head; the grade is from 7 inches to 8 inches in 12 feet. This washing in the cradle relieves the pulp of about 25% of waste material. Twelve tons can be washed in a day. The canvas-plant below the vanner has some interesting features. The canvas strips are only 12 inches wide. The pulp as it leaves the vanner is carried to a mercury-trap, consisting of a box of diminishing width, with three upright divisions, under and over which the pulp flows. From the mercury-trap the pulp falls into a long box, about 1 foot square at the ends, in the bottom of which are ten holes, whose size is regulated by experience; they must equalize the discharge with the inflow from the mercury-trap. The pulp introduced into the long distributor-box sizes itself to some extent by gravity; the finer material, being held in suspension longer, finds its way out at the end of the box, while the coarse quickly passes through the holes in the bottom, nearer the center of the box.

There are twelve strips of canvas, 100 feet in length, each strip having a width of 12 inches and a grade of 4½ inches in 12 feet. The coarse material is all found on the six center sections, the two outside sections, on each side, carrying the finer material. An additional series of tables, with 20 inches wide sections and a grade of 9 inches in 12 feet, receives the pulp after passing over the first.

No. 2. *Amador County.*—The practice of this mill in handling their tailings may be taken as an example of the better methods now practiced in the State. This mill has 900-lb. stamps, dropping 85 times per minute, with a 6-inch drop and a 7-inch discharge, kept constant by the use of lower chock-blocks. No. 30 brass wire screens, 4 feet long and 4 inches wide, set vertical, are used, given a duty per stamp of 2½ tons in twenty-four hours. The batteries are supplied with inside front plates. The apron-plates are 46x30 inches, set on a grade of 1¾ inches to the foot. These are followed by 18 feet of sluice-plates, 15 inches wide, the first 10 feet of which are double. About 66% of the amalgam is recovered in the battery. The loss in quicksilver, which is introduced into the battery every half hour, amounts to about 1½ cents per ton. The total cost of milling at these works is given as 70 cents per ton. The mill is supplied with three vanners to each battery, with 4½-foot belts. The pulp from the plate-sluices passes directly to the spreaders of the vanners, a division into thirds being first effected. After leaving the belts, the pulp flows through sluices to a flume, where it is divided into two equal streams by the insertion of an adjustable division plate in the flume. The divided pulp passes to two steel screens with perforations of ⅛-inch and 1/16-inch respectively, which from the bottom of two 4-foot boxes, 1 foot wide, set on a reverse grade of 6 inches in 4 feet. These boxes prevent any foreign substance from passing through into the sizing-box below, and clogging the outflow pipes. After the passage of the screens the pulp falls into a separator, consisting of a wooden V-shaped trough, 6 feet long, 15 inches wide on top and 2 inches at the bottom, with a flat, funnel-shaped discharge pipe of galvanized iron attached at one end, ending in a round 2-inch pipe. As more pulp enters the separator than can be discharged through the 2-inch pipe, it fills and flows over the end into a launder; the heavier and larger particles sinking down and passing through the pipe. The overflow passes on a spreader that delivers it to a canvas-table, with ten sections; a second similar table, placed below, receives the waste from the first one. The tables are 12 feet wide, 13 feet long, and set on a grade of 1½ inches to the foot, and to secure a proper grade for the waste-sluice, each section is set 4 inches below its predecessor. All the waste water passing from the tables is used a short distance off as power on an overshot wheel that runs a vanner, on which are worked the concentrates taken from the tables.

No. 3. *Butte County.*—The quartz carries considerable sulphurets. When hoisted from the mine it is dropped immediately over a grizzly with the bars placed 1½ inches apart; the coarse rock crushed is loaded into cars, and trammed to the mill, distant about 150 yards, and dumped into bins which are calculated to carry 1,500 tons. From here chutes convey the ore to the Challenge self-feeders. These are operated from the center stamp in each battery. The stamps, which are supplied with steel shoes and dies, weigh 850 lbs., drop 7 inches, and about 100 times per minute; the discharge is 7 inches; the screen is No. 8 diagonal-slot, 8 inches wide; each stamp crushes 2½ tons per twenty-four hours. The screens, which last about four weeks, are used later in the chlorination works for the recovery of cement copper. From the mortar the pulp passes over a 14-inch mortar-plate; thence to a 4-foot apron and 12 feet of sluice-plates; aprons and plates are set to a grade of 3 inches to the foot. The pulp then passes over the vanners, two for each battery, after leaving which, it is conveyed to the canvas-platform house. The canvas-platform is 24 feet wide and 60 feet long, covered with x 2 0 0 canvas, and below it are 150 feet of settling-boxes. The plates are scraped every day, and dressed besides, when required.

# Scientific Progress.

### A Giant Among Inventions.

The Government has recently granted two patents which cover probably the most intricate and complex machine ever constructed. It is claimed that before the first machine was perfected the company constructing it had expended $1,300,000. The first application filed contained 204 sheets of drawings, having over 1000 separate views. During the eight years the case was pending in the office before the allowance, the number of sheets was reduced to 163. When it is remembered that the majority of pateuts have but a single sheet of drawings, and that to require as many as ten sheets is quite an exception, the magnitude of the invention can be understood.

The fees charged by the Patent Office are uniform for all cases, no matter how complex or how simple, $15 on filing the case and $20 additional on allowance of the patent.

When this case was filed it was turned over for examination to an examiner who received a salary of $1800, and he spent six weeks in studying the case before being able to make the first action. The entire specification was twice rewritten, each time by a different attorney. How much this cost the inventor is not known, but it is rumored that the attorney who first prepared the case received a fee of $10,000, and an allowance of $2000 extra to pay for drawings.

While the case was pending the examiner who first had charge of it resigned, and it was turned over to another assistant of the same rank. This assistant went over the entire ground three times, consuming several weeks, and finally he was authorized to go to Chicago and spend a month in examining a working machine. When the request was first made of the commissioner that the examiner be permitted to make the trip it was promptly refused. The chief of the division then carried the papers, making a pile two feet thick of unfolded drawings and typewritten specification, to him, and the commissioner said: "He can go."

The invention is a machine for setting, justifying and distributing type, and comes as near being a substitute for the compositor's intellect, as well as hand, as any machine can. It comprises no less than 18,000 separate parts, and has 800 bearing shafts, about half of the shafts rotating continuously and the rest intermittently, as required to perform their various functions. The justifying part of the apparatus was made the subject of a second patent, which contains eighty-one sheets of drawings, giving a total of 244 sheets for the entire apparatus.

The Patent Office is a money making institution. It earns above expenses about $200,000 per year, and has now deposited in the Treasury a neat little balance of over $4,000,000. On this job, however, it lost heavily.

In a recent address before the American Association for the Advancement of Science, Mansfield Merriman said that during all the development of static testing one impact test has survived and everywhere held its own. This is the cold-bend test for wrought iron and steel. In the rolling mill it is used to judge of the purity and quality of the muck bar; in the steel mill it serves to classify and grade the material almost as well as chemical analysis can do, and in the purchase of shape iron it affords a quick and reliable method of estimating toughness, ductility, strength, and resilience. It is true that numerical values of these qualities are not obtained, but the indications are so valuable that if all tests except one were to be abandoned the simple cold-bend test would probably be the one which the majority of engineers would desire to retain.

The discovery that heat influences one set of nerve points in the skin, while sensations of cold are received by another set, has been followed by an interesting investigation by two Italian physiologists, whose experiments seem to indicate that the various tastes result from the exciting of distinct sets of nerve fibers in the tongue. The prolonged application of ice removed the sensibility for all tastes—sweet, sour, salt and bitter. Cocaine destroyed—temporarily, of course—sensibility for bitter only. Other substances, such as caffeine and morphia, reduced the power of discriminating between different degrees of bitter. Dilute sulphuric acid had a peculiar effect, causing distilled water and even quinine to taste sweet at the tip of the tongue, although the bitter of the quinine was elsewhere tasted as usual.

Science advises the use of fruit as an aid to digestion of other foods, such, for example, as apple sauce, little sweetened, or, still better, sour apples baked, or, for more developed digestive action, the raw apple or other fruit. The mandate of science is that fruits should be used as an aid to digestion much more than they are now. The fruits supply acids which particularly assist the acids of the stomach. On the same ground, lemon juice in tea instead of sugar is helpful to digestion. Physicians now largely prescribe lemon juice to help weak digestion. A great many persons who get up with bad feelings in the morning would find themselves cured if they regularly ate an apple with a slice of bread or other plain food a little while before bedtime.

It is curious to note how the progress of knowledge causes the medical profession to change its opinions. It has always been thought that the use of new bread is most unhealthy, a doctrine which is religiously believed in and acted upon in most households. But a Russian doctor now asserts that new bread is far more beneficial to the consumer than that which has been cut and exposed to the air, and has had time to gather the numerous germs which find in the material a nutrient medium. The heat of the oven is destructive to these germs, and hence new bread is found to be perfectly free from them.

A balloon filled with automatic instruments was sent up recently in Paris and came down safely. The instrument showed that it had risen to 17,000 meters, 56,000 feet, or over ten miles and a half. At that height the temperature outside the balloon was 102° below zero, while inside it was 12° above. The apparatus for taking in a sample of the air seems to have worked satisfactorily, but the result will not be known until the analysis of its contents is made in M. Barthelot's laboratory.

# Electrical Progress.

### Acetylene Gas From an Electrical Standpoint.

On the 15th ult., at the Milwaukee meeting of the Northwestern Electrical Association, J. C. M'Minn, in a paper on acetylene gas, thus summed up the situation from an electrical standpoint:

This is a new gas, having an illuminating power much greater than common gas. No investment for street mains is necessary, hence the gas companies must use it either as an enricher or as an adjunct to their present system to supply isolated buildings and residences which can be reached neither by their present mains nor by electric lights. If they obtain the rights for this gas, they will have a weapon which will be as much stronger than the Welsbach burners as the acetylene flame is stronger than the Welsbach light. To produce this gas or calcium carbide the gas companies must put in electric plants, which when not in use making carbide can be placed in competition in electric lighting.

There are places, and many of them, where nothing will ever supersede the use of electric lights, but when you consider that only five per cent of the residents of southern Wisconsin are reached by gas and only thirty per cent are reached in Milwaukee, that even less can be supplied with electric lights, there is a field open which is wonderful in the possibilities for successful investments and large business.

Most of your lighting plants are idle during at least half the time, and could thus be made producing plants for the whole time, and you could reach a territory which cannot be reached by either the gas companies or yourselves without large outlays for extensions, and in most cases not reached at all.

Of the following facts I am certain:

1. The gas is intensely brilliant.

2. It has a decidedly disagreeable odor if it escapes without being burned, and when burned emits no odor nor smoke.

3. The gas can be distributed for much less cost (considering the interest on the investment) in cities and also to every resident of the State, whether in the city or country.

4. The same amount of light can be produced for much less cost than by ordinary gas or electricity, for one-third cubic foot of acetylene gas burned per hour gives more illumination than a sixteen candle power incandescent light or five cubic feet of ordinary gas. Allowing a maximum cost of $50 per ton for carbide, delivered either as a liquid or as carbide, sixteen candle power with acetylene (one-third cubic foot per hour) costs .0016; sixteen candle power incandescent costs practically .006; sixteen candle power ordinary gas, at $1.76 per 1000 cubic feet, with four-foot tip, .00704, or acetylene costs $\frac{1}{100}$ of a cent per hour as compared with electricity at $\frac{6}{10}$ of a cent and ordinary gas at $\frac{7}{10}$ of a cent.

The above figures are based on the present method of manufacture and maximum cost, and no allowances are made for the improvements which must necessarily follow experimentation by practical men.

---

THE project to put in a large electric plant in Mariposa county, previously noted in this column, is in active process of development, it being proposed to begin active work the latter part of next month. The Big Bend Power Co., incorporation of which was announced some weeks ago, with a paid up capital of $500,000, is not a mining corporation per se. The idea is to generate and sell electrical power to the fifty or more gold mining concerns in the neighborhood. At Horseshoe Bend, near the geographical center of Mariposa county, on the Merced river, is the point selected for the erection of the plant. A dam sixty-five feet in length on the top, and thirty-five feet high, will be built about 6000 feet above the site of the buildings, a ditch and flume to have a fall of ninety-five feet, capable of carrying 10,000 miners' inches of water and generating 1700 H. P. It is proposed to put in three 500-H. P. generators, with all the usual accompanying apparatus, including nearly twenty-five miles of No. 2 copper wire. It will probably be six months before active work on the dam will begin, it being, of course, necessary to build that at the lowest stage of water. The corporation is credited with intention to supply power at $5 per H. P. per month, and figures its ability to make considerable profit at that rate, while furnishing power at considerably less cost than under any other method and enabling many mines to operate at lessened expense. If all the present outlined plans of the projectors are put into actual existence, Mariposa county will have the second largest electrical system in the State.

### A New Electric Lamp.

In the use of the common arc lamp a serious item of expense is the wasting of the carbons, and the necessity of renewing them. What is called the Jandus lamp is one in which, by a peculiar construction, the consumption of the carbons is lessened to such an extent that carbons will last 160 to 200 hours which in the common lamp are consumed in eight or ten hours. The Jandus lamp has the carbons enclosed in two glass globes, one within the other. The outer one has a valve which permits outflow of air or other gas, but does not permit much or any inflow of air. The inner globe is very soon free from oxygen, with the result that the carbon lasts twenty times as long as it otherwise would; proving that the wasting of the carbon is not by the electric current tearing its atoms apart, but is through the oxygen attacking it. The oxygen eats away the carbon, tears away its atoms, atom by atom, twenty times as fast as the electric current will do it. The illustration of the attacking energy of oxygen, of its superior electrical work, is as conclusive as it is striking. The intensity of the oxygen in tearing away the carbon atom by atom exceeds that of the electric current passing through the carbons.

### Cementation of Steel by Electricity.

This has been effected by J. Garnier as follows: Two steel rods, whose proportion of carbon was only 0.001, were placed in a fireproof tubs so that their extremities were one centimeter apart. The intervening space was filled with powdered charcoal, and the tube heated in a small blast furnace, while an electric current of thirty-five amperes and two and five-tenths volts was passed through the rods. The temperature of the tube was brought up to 900–1000° C. After three hours the rod forming the positive pole remained essentially unaltered; the other rod, however, as deeply cemented with charcoal. Hence it follows that iron, by this process, might be very easily converted into steel.

---

THE *Investor* says that the scheme for bringing power from the Kern river to Los Angeles, a distance of 108 miles, is still in an active state, so far as preliminary work is concerned. The company has obtained a franchise from the Kern county supervisors and also one from the supervisors of Los Angeles county costing $25. A right of way across the Government Forest Reserve is also required, for which an act of Congress is necessary, which will no doubt cost more. The plan of the works is of a very extensive kind, and the commercial success of the undertaking depends upon a number of factors that have yet to be considered. At the proper time the promoters intend to make the experiment of raising funds by floating a two million six per cent bond issue, when the scheme will assume a more definite character than at present.

# Mechanical Progress.

### The Inspection and Testing of Materials.

Written by ALFRED P. BOLLER.

With the vast development of constructive engineering during the last twenty-five years has arisen the necessity for a thorough knowledge of the strength of materials, to be gained only from actual experiment. As increasing knowledge always opens vistas of the unknown, the testing of materials has grown from simple methods of procedure into an elaborate scientific system of means and methods, calling into play various apparatus of power and precision. This has given rise to a class of specialists who make a business of testing and inspecting materials, and to a branch of mechanical engineering devoted to the designing and manufacture of testing machines and various recording devices. No important work is now undertaken without careful provision for testing all materials which enter into it, and under specifications evolved from the recorded experience of experimenters continually at work throughout the civilized world. With the improvements of apparatus, new light on the behavior of materials under varying conditions is continually obtained, and specifications are from time to time modified accordingly. Few railways of any importance are without a testing bureau in charge of careful experimenters. To these bureaus are brought samples of all sorts of materials required in the conduct and maintenance of a railway, and upon the bureau report of quality, application and endurance the standards are determined and specifications for purchase issued accordingly. Minor railways and other corporate and private interests are served by various testing laboratories and testing bureaus established in the different centers of manufacturing and engineering activity.

The result of such a close watch over constructive material has been to force manufacturers into scientific modes of manufacture and to pay close attention to quality and uniformity of product as the price of their very existence. Such work has made possible the great engineering triumphs of the day, in which the humble testing machine has played a no inconsiderable part. While the time has passed when testing and inspection of materials was regarded as a luxury or an engineer's fad by "the financial interest," there is a tendency to incite too much competition among the laboratories, resulting, in many cases, in a price for services and the use of machines below what such work can be efficiently performed. The consequence is, the testing is not thorough and inspection perfunctorily gone through with, resulting in unreliable reports. In this business, like any other, work and services are worth all they cost, plus a reasonable profit, and it is no evidence of business smartness on the part of an employer to beat down rates and prices below which he can get efficient service. If done at all, testing and inspection should be thoroughly done, or it is worse than useless, as it is misleading in creating a confidence on a basis that does not exist. No money is better invested in public or private work on which life depends than that paid in carefully looking after it, to see that it is well done, of good materials for the purpose, and efficiently made and put together.

### Gun Manufacture.

There seems to be reason to suppose that the art of gun manufacture will be revolutionized by the Maxim plan of manufacturing guns from one solid integral forging. In the Maxim system the forging is roughly turned and then annealed in a slow furnace. It is next carefully turned, smooth-bored and rifled. Then it is mounted vertically in a special furnace and rotated slowly while a current of cold gas is forced through the bore. The carbon in the gas combines with the steel of the bore, hardening it and improving the quality of the steel. While the gun is red hot the coal gas is shut off and a very large stream of cold oil under high pressure is forced through the bore. This cools the bore and the inside shrinks to its finished dimension. The outside body of the gun then gradually shrinks upon the cooled interior portion, thus throwing it into the state of high tension which is necessary to enable the gun to resist instantaneously with its whole mass the shock of discharge. It is believed that by this method heavy ordnance can be manufactured in half the time and at half the expense of the present system.

## The Works of Stephen Roper.

**Engineer's Handy-Book:** Containing a full Explanation of the Steam Engine Indicator, and Its Use and Advantages to Engineers and Steam Users. With Formulæ for Estimating the Power of all Classes of Steam Engines; also Facts, Figures, Questions and Tables for Engineers who wish to qualify themselves for the United States Navy, the Revenue Service, the Merchant Marine, or to take charge of the Better Class of Stationary Steam Engines. Tenth Edition. 630 pages. 16mo., tuck, gilt edge.....$3.50

**A Catechism of High Pressure or Non-Condensing Steam Engines:** Including the Modeling, Constructing and Management of Steam Engines and Steam Boilers. With Illustrations. Eighteenth Edition, revised. 252 pages. 18mo., tuck, gilt edge.....$2.00

**Questions and Answers for Engineers:** This little book contains all the questions that Engineers will be asked when undergoing an examination for the purpose of procuring licenses, and they are so plain that any Engineer or Fireman of ordinary intelligence may commit them to memory in a short time. 61 pages. 18mo. Morocco.....$3.00

**Instructions and Suggestions for Engineers and Firemen,** who wish to procure a License, Certificate or Permit, to take charge of any class of Steam Engines, or Boilers, Stationary, Locomotive, and Marine. 66 pages. 18mo. Morocco...$2.00

**The Steam Boiler: Its Care and Management:** With Instructions for Increasing the efficiency and economy, and Insuring the Durability and Longevity, of all classes of Steam Boilers, Stationary, Locomotive, Marine, and Portable. With Hints and Suggestions and Advice to Engineers, Firemen, and Owners of Steam Boilers. 133 pages. 12mo., tuck, gilt edge.....$2.00

**Use and Abuse of the Steam Boiler.** Ninth Edition, with Illustrations. 18mo., tucks, gilt edge.....$2.00

**Hand-Book of the Locomotive:** Including the Construction of Engines and Boilers, and the Construction, Management and Running of Locomotives. Twelfth Edition, revised. 324 pages. 18mo., tucks, gilt edge.....$2.50

**Hand-Book of Land and Marine Engines:** Including the Modeling, Construction, Running and Management of Land and Marine Engines and Boilers. With Illustrations. Seventh Edition, revised, enlarged and improved. 598 pages. 12mo., tucks, gilt edge.....$3.50

**Hand-Book of Modern Steam Fire Engines:** Including the Running, Care and Management of Steam Fire Engines and Fire Pumps. With Illustrations. 411 pages. 12mo., tucks, gilt edge...$3.50

**The Young Engineer's Own Book:** Containing an Explanation of the Principle and Theories on which the Steam Engine as a Prime Mover is based. With 106 Illustrations. 363 pages. 18mo., tucks, gilt edge.....$3.00

*Now ready. Our new pocket catalogue of books on Steam, and the Steam Engine, Mechanics, Machinery and Mechanical Engineering, mailed on request.*

**718 Third St., San Francisco, Cal.**

## The Russell Process.

For information concerning this process for the reduction of ores containing precious metals, and terms of license, apply to

**THE RUSSELL PROCESS CO.,**
**Park City, Utah.**

# Mining Summary.

## CALIFORNIA.

### Amador.

ONEIDA. — *Republican:* The heavy rains have brought mining operations to a temporary standstill. The ground is so thoroughly saturated with water that it was found impracticable to continue sinking operations, owing to the trouble with surface water.

A ten-stamp mill is being erected for the Matson mine, at Butte City.

The big tunnel to tap Butte basin is making slow headway. It has reached about twenty feet under cover.

The Gover mill of twenty stamps has started up again, after a rest of nearly two years.

The Anita Company has posted notices calling for bids for sinking its shaft 100 feet deeper; contractors to furnish powder, fuse and caps.

The last cleanup of the South Eureka mill, it is said, averaged $7 per ton. This, if it can be taken as a fair criterion of the grade of the rock, leaves a good margin of profit, and places the South Eureka among the list of steady producing mines of the county. There is little probability of a mine on the mother lode closing down while it surrenders rock that yields $4 to $5 per ton. Such ore can be milled at a profit on this lode, unless the conditions are unusually unfavorable for economical working. The Plymouth Consolidated in the height of its prosperity mined and milled rock at an average cost of $1.80 per ton. We believe with a forty-stamp mill ore can be worked at a cost of from $2 to $2.50 per ton, under favorable circumstances. And this is by no means to be regarded as the minimum limit. In Alaska, at the Treadwell mine, they have got the cost down to $1.20 per ton. In Australia they are successfully working quartz that yields only a dollar per ton. So there is plenty of margin left for reduction of cost in the extraction and treatment of gold ores in California.

There is nothing doing at the Amador Queen mine in Hunt's gulch. Everything has been at a standstill since the mill was cleaned up several weeks ago. Mr. Dye, the manager, realized that to prove whether they had a paying property it was necessary to sink two or three hundred feet deeper.

### Calaveras.

INFORMING THE UTAHNS.—Salt Lake, Utah, *Tribune:* E. S. De Golyer returned to the city yesterday morning, and has since been enlightening an attentive audience at the Alta Club upon the riches of Calaveras county, Cal., and the "Mother Lode."

At present Mr. De Golyer is devoting his own attention to the Donnellan mine on the big lode, for which a mill has just been completed that is capable of handling seventy-five tons of free milling ore a day, with 200,000 tons in sight. In designing the present plant, said Mr. De Golyer, it was more to aid him in the dig for lower levels—the values improving as depth is attained—than to handle the ores that are now quarried from an immense zone. When the lower level is reached a plant of adequate capacity may be looked for. Calaveras county, he says, was the biggest gold-producing locality in California last year, and with more territory now under active development than ever the record of 1896 will, in his opinion, eclipse that of all former years.

Of the present producers the Utica, which has a bullion record of many millions, is the largest, and of the total output of 1895 it produced more than any other, with the output increasing and the ores growing richer as depth is gained.

Among other Utah miners who are actively engaged in the district the name of A. N. Butts, one of the former owners of the Golden Gate at Mercur, is mentioned. He has purchased and is developing the Bolitho, situated near the Utica, and which presents a very fine showing.

It was before Mr. Butts parted with the Golden Gate that Mr. De Golyer sought to induce Henry Wolcott and Jake Saunders to purchase the property, which has been made to develop enormous ore bodies. That the Coloradoans did not take it marks a disastrous day in their career. On his last journey into Calaveras county Mr. De Golyer met George Arthur Rice coming out. The latter had secured a foothold on a property near West Point which promises to enrich him.

"As strange as it may appear," said the narrator in conclusion, "there are no more enthusiastic friends of free coinage of silver than are to be found in California. I say strange because the production of silver there last year did not exceed 500,000 ounces. The production there is almost exclusively gold, but they have learned that for their other industries to prosper there must be an expansion of the currency. Without that hard times must continue, and when California registers its vote it will be for a silver man."

Mr. De Golyer will remain in the city some days, and may visit Mercur and the Golden Gate, that when he again meets Henry Wolcott and Jake Saunders he may convince them of the full magnitude of the mistake they made in refusing it.

### El Dorado.

(Special Correspondence.) — The ten-stamp mill on the Franklin gravel mine, 1½ miles from Placerville, is among the continuous operators and regular bullion shippers. It is the property of Thos. Clark and others of Placerville.

The Philadelphia and Gold Note mines, situated twenty miles east of here, which was closed for several months owing to the failure of an Eastern partner to meet his obligations, started up again this week. Sacramento and San Francisco parties have joined Messrs. Polk and Parker, the original owners. The shaft is down 140 feet. The ledge is seven feet wide and has high grade ribbon rock. The ten-stamp mill will be increased to double its present capacity.

The new hoist frame in course of erection on the Big Sandy is rapidly approaching completion. Machinery for pumping out the shaft preparatory to sinking to a depth of 500 feet is on the ground ready to be put in position. The sandy formation (from which the mine took its name) having been worked out, and the property belonging to Ohio men, it is contemplated rechristening the mine and calling it the Buckeye. Present indications warrant the prediction that this will be a rich and long-lived producer of gold. The ledge is large and high grade. The fact that Mr. Beardslee, of the neighboring Lady Emma, after his thorough examination of the property, persuaded the Toledo people to rehabilitate their property and put it in operation, will prove to his credit and to their gain. Jas. T. Kelly is acting local manager of the construction work.

The Spring Tunnel mine, owned by G. J. Carpenter, was leased by a French syndicate and work was commenced opening the 1500-foot tunnel last week.

Mining capitalists animate our hotel corridors this week to a degree that gives the town the appearance of a Capital city State convention.

Hospitality, business enterprise, and the general good nature concomitant with metropolitan manners and methods on the part of Placerville people greet visiting mining men on all sides. This is certainly a desirable spot as a center for the great mining camp that El Dorado county will soon prove to be.

John Melton, the millionaire mining man of Brown Bear (Trinity county) fame is branching out in new mining investments in El Dorado county. He is also adding new territory to his Gentle Annie group, near Placerville, which is giving substantial proof of becoming one of the richest gold producers of California.

Placerville, Feb. 3, '96.

### Nevada.

NEVADA IRON DEPOSITS. — (Special Correspondence).—The cost of manufacturing iron depends on the cost of fuel and ores. Furnace expenses vary with the difference of wage here, which is trifling. If San Francisco would manufacture its own iron and steel, the freight now paid would offset the freight on fuel. It takes less than a ton of fuel to smelt a ton of iron. This would give the city the advantage in manufacturing her own iron and steel. One hundred and thirty miles from the city there is a body of hematite ore assaying 54 per cent metallic iron. There is sufficient in sight to run a 30-ton furnace fifty years within 25 feet of the river, which is navigable to the city. A road can be economically constructed, as three-fourths of the distance is level. In itself it would be a paying investment. San Francisco is not manufacturing her own iron and steel. The millions exported for this necessity would have made the city rich. The failure at Clipper Gap is still felt. There is but one place in the northern part of California where you can manufacture iron and be successful—that is San Francisco. First, the consumption in the city itself is large, and when you produce a molten iron many things can be made which would save the cost of remelting. Molten iron can be converted into a homogeneous steel at a cost not to exceed from $2 to $3, depending on the character of steel needed. All mining supplies can be furnished for one-half the present cost and leave a large margin of profit. Shoes and dies require extra per cent of carbon to make them the required hardness. Steel plate for ship building can be produced from this molten iron at a cost not to exceed $8; steel rails, carwheels and all other castings at about the same rate. San Francisco can produce a molten iron for $14, steel plate for ship building for $22; steel rails, carwheels and other steel castings at about the same figure. It would be a victory in the right direction. Instead of impoverishing the State importing those things building up other cities, our own city would flourish with cheap iron and steel. Other industries will spring into existence. Ship building will not remain in the bud, but will blossom. With cheap iron and steel Huntington's shipyard captured the contract from the Government of between four and five million dollars. We had a recommendation from Congress, but the discrepancy was too much. San Francisco may gridiron the State with rail; what will it benefit you unless the city gets the trade from the interior? Can you compete with those from whom you purchase your goods? This is the present outlook and it is getting worse every day. Therefore, the sooner you face the situation the better. Regarding the iron deposit referred to, its location is in the western portion of Nevada county, close to the Marysville stage road, eleven miles from Grass Valley and one mile below Indian Spring, on Robinson's ranch. The hill is about 300 feet high, with an open cut. This ore can be loaded on cars for 10 cents per ton. The ore body is from 100 to 300 inches in width. M. C. T.

Grass Valley, Cal., Feb. 3, '96.

ERRONEOUS STATEMENT.—*Tidings:* The Anti-Debris Association will make the most it can of the disasters which befell the restraining dams during the late storm. In respect to the Omega dam it has an unconscious ally in the Associated Press, which in its report of the meeting at Sacramento made erroneous statements concerning that dam. The report stated: "But the worst disaster was that to the Omega mine dam. This was the largest restraining dam yet built in the State and was considered perfectly safe. But it had to succumb, and the debris which a few days ago was deposited in tons behind the restraining wall is now scattered over miles of river bed."

In the original accounts of this accident, it was stated in all the local papers that no debris had yet accumulated behind the Omega dam. The company had not yet begun operations. There was an accumulation of water, and in letting off this excessive supply, the error was made of cutting a channel through loose earth at one end of the dam. This channel widened by the caving of adjacent earth, and soon one end of the structure was undermined and the dam was swept away. There is nothing in these facts to indicate that the dam might not have stood, had wise counsels prevailed in drawing off the surplus water. We regret to note that false statements about the accident to this dam are given currency in our very midst.

### Placer.

*Sentinel:* There are at present 150 men on the payroll of the Hidden Treasure mine. Twenty-five of these men are working at the Dam tunnel and four miners are busy retimbering the old Mountain Gate tunnel.

### Plumas.

*Independent:* Superintendent Wm. McGilivary had a force of six men completing preliminary work last week on the Plumas Imperial and on Friday commenced piping.

The Elizabeth Shaft shut down Saturday night, the pumps proving incapable of handling the large flow of surface water with which they had to contend. It is uncertain when they will again resume, as it is probable a reorganization of the company will first be made.

### Riverside.

*Investor:* The chief mining activity in this section is now in the Perris country, where a number of promising claims are being steadily developed. Efforts that have been made to interest capital in this section are likely to prove successful in several cases during the next few weeks, and there is a prospect of important developments in this gold region very shortly. Mines around Perris are within five miles of a railroad, with country roads running to them that are far better than some of the streets of Los Angeles have been for the past week or two. Then, again, the cost of fuel and supplies is less than half what it is in many mining camps which have paid millions of dollars in dividends. When ore can be milled and mined for $2 a ton, or even less, as can be done in Riverside county, it is easy to see what a great advantage this gives the mine owner over sections where fuel, transportation and supplies all cost from two to five times as much.

SHIPPING CONCENTRATES. — *Record:* The Good Hope Company recently worked over a lot of its tailings and as a result this week shipped 32,000 pounds of concentrates to Pueblo, Colo. This makes the second shipment that has been made within the past two months. Under the Sigafus regime the Good Hope concentrates netted about $75 to the ton, and if this can be taken as a criterion, the last two shipments will net the company quite a revenue.

### San Diego.

ESCONDIDO AND VICINITY.—(Special Correspondence).—I will endeavor to give you an authentic report of the mining interests at this place, as they now exist. We came to this locality the first of last April and have been carefully prospecting the country for our interests, our only object being to discover a deposit of gold that would pay to work. Our attention was first attracted to this locality last winter, while on a visit here, and having had several years' experience in mines and mining at Aspen and Leadville, Colorado, and over four years of prospecting and investigating through California, we were thoroughly convinced that gold existed in this locality in paying quantities. Our first investigation was at the old Spanish mines, that are situated about three miles southeast of town. For the last forty years the Indians and a few white men have been taking out free gold at these mines. The gold is in particles or broken pieces of quartz, which is deposited in narrow stringers through the loose earth of the hillsides; these stringers of quartz having a roofing of granite that slopes to the west with a dip of 45°. Some very rich pockets have been found, but up to the present time the "mother ledge" has not been found. Having discovered that the gold in this quartz was deposited in spots of black manganese and brown hematite, and that the formation was of the old primary or glacial age, and that the secondary rocks came up from the north and formed a junction with the primary, which circles the valley in the form of a horse shoe and extends in length for a distance of about twelve miles in this shape, with a spur of the same formation jutting into it from the southwest and extending to the ocean, some ten miles away, and that the granite that capped the mountains in the primary range was showing fissures both large and small that were highly impregnated with iron and zinc, and that these fissures ran parallel with the granite ledges, as well as at right angles, and that the base of the mountains and the low range of hills that lie between the primary and secondary showed fissures of spar and quartz, we concluded that our time would not be lost if we made a thorough and intelligent investigation. Our first discovery of importance was made after thirty days of careful prospecting at a point about four miles southwest from the old Spanish mines and on the banks of the Bernardo river, a stream of considerable size, that cuts through the old primary on the east and follows base of the mountain in a southwest direction, where it enters into the ocean. This first discovery was situated almost directly in the center of the mineral belt, which at this point is about one mile wide, and consisted of a well defined chimney of apparently volcanic origin. This chimney is about 50 feet across at the top and is filled with a decomposed quartz, carrying large quantities of brown hematite and red oxides of iron, with manganese and a trace of tellurium. Several quartz ledges intersect this chimney, varying in width from 2 to 6 feet. All the veins of quartz at this place, as well as the vein matter in the chimney proper are decomposed by the action of chlorine. This chimney was situated on private land, formerly a Spanish grant, so that it was necessary to purchase the land before sinking. We secured 45 acres and sunk a shaft 30 feet from the chimney between two ledges of quartz. We are down 60 feet and have a drift 20 feet long at the 25-foot level. The assay from this shaft ran $9 in gold and 47c silver at the grass roots, and has increased satisfatorily as we went deeper. All the matter from this shaft is chlorides, and no colors could be horned until after passing the forty-foot level. At the present writing we have just tapped a ledge of solid quartz, the body of which only assays $3 in gold, but the seams are coated with brown hematite, which is covered with oxidized gold and silver, apparently deposited by the action of electricity on tellurium. Specimens from these seams are very beautiful, showing all the colors of the peacock; but the green, blue and purple are of the brilliancy of emerald, sapphire and the richest amethyst. By applying nitric acid and blowpipe we produced beads of gold from these colors. No assays have yet been made from these specimens, as they were too valuable as cabinet specimens. This chimney is known as the Mountain Lion mine and is owned by Messrs. H. C. Brown, J. M. Best and C. Dewitt Chapman.

The next discovery of importance was north of the old Spanish mines, some three miles, and about the same distance from Escondido, and consists of a large body of quartz. Situated at the foot of the mountain of the primary range, and at the exact junction of the primary and secondary formations, this body of quartz is of such immense proportions that it took months of study and careful investigation to determine that it was in place, and that it all carried gold and silver. The vein matter is exposed for over half a mile and has an average width of 300 feet. It is constructed of numerous fissures, varying from ten inches to twelve feet in thickness. These veins are grouped together so closely that they have the appearance of a solid ledge. The entire vein matter is quartz of various colors and structure, and over fifty assays from different portions of the deposit all show gold from $1 to $27 per ton at the surface. The north end of this property is filled with sulphurets, while the south end of the ledge, where it is exposed, shows few sulphurets. Iron oxides and a black substance, supposed to be manganese, show in the seams. There is a layer of micaceous slate about four feet thick that overlaps the quartz where it runs under the granite at the base of the mountain. This immense ledge lies parallel with the mountain, which bounds it on the east, and although a width of 300 feet of this ledge is exposed, it still seems to continue under the mountain. This property has recently passed into the hands of the Geneva Gold Mining and Milling Co., whose main office is at Santa Ana, Cal.

After leaving the above property, we will pass on down to Bernardo river to a point half a mile below the "Mountain Lion" property. Here the formation still shows the primary granite as the cap or body of the mountains. The base of the mountains on each side of the river is gashed with veins of quartz and beds of chlorides, some of the latter showing immense quantities of brown hematite and red oxides. Down to this point there has been no development work done, excepting where Mr. Ables has a shaft 12 feet deep. His last assay was $500 per ton in the red oxide. The land down to this point was home-steaded years ago and the valley used for farming, the owners little dreaming that they were the possessors of mineral deposits. Half a mile down the river from this shaft the Government land comes in and the granite changes to syenite of a close-grained structure, showing a slight greenish tinge and filled with small particles of hornblende, sprinkled with yellow sulphurets of the flat and round variety. This rock forms the body of the mountain, while the summits are crowned with round boulders and ledges of blue granite. The bed of the river at this point shows narrow fisures filled with black lava. On the north side of the river a kind of black, hard slate crops at the water line. These mountains on the north are literally filled with large ledges of quartz, running in various directions, ranging in thickness from 6 to 100 feet. Some of them are broken at the top, but all are in place and vary in structure from the hardest syenite quartz to the finest sugar-loaf. Up to date no ledge has been assayed that failed to assay gold with some silver, the assay running from $1.50 to $12. All these ledges carry sulphurets in profusion. An assay of the syenite caprock gave a result of $1.13 gold, 11 cents silver. This formation continues to exist for a distance of about five miles in width on the north side of the river and for about eight miles toward the ocean from this point. No free gold has been discovered, with the exception of a small quantity that has been washed from the bedrock of the river and from the bedrock of one gulch. The land here for many miles is still Government land. Some 150 claims have been staked out by the ranchers, but as none of them are miners and no nuggets are in sight they are doing very little development work. Perhaps the most remarkable find in this locality is what is known as the "Jolly Boy" claim, situated at the border of the valley, half a mile west of the river and at the foot of the mountain on the east side. Here an immense ledge of sugar-loaf quartz 100 feet wide runs under and into the mountain in a southwest direction. This ledge is so solid that it was impossible to break into it without blasting, and as the outside where it is exposed was discolored by iron, that settled from the water flowing over it, it has up to the last three weeks been taken for granite. The end of this ledge is exposed for something like 300 feet on the top and is cut square down next to the valley, exposing a face 50 feet high. This quartz is so completely filled with bright yellow sulphurets that it would require four concentrators to handle the output of ten

stamps. This ledge assays $4 in gold and 30 cents in silver at the top.

There was a blast put in a few days ago which dislodged some ten tons of the ore, and assays are now being made. On the north of the ledge, next to the mountain, is a granite wall, while on the south, where the land slopes for some 300 feet before the ledge enters the mountain, is a bed of decomposed matter of gray and yellow. The discoverers of this claim cut a tunnel into the body of chlorides near the surface, and struck the ledge at the end of the mountain. Just before reaching the ledge, and lying directly against it, was a vein of dark blue clay. This body of matter is so highly charged with chlorine at the present time that on entering the tunnel one can smell the gas arising therefrom. All the walls of the tunnel are now, after a few weeks, covered with crystals, and samples of the decomposed matter taken from the sides of the tunnel are being saturated with water and boiled. The chlorine was of sufficient strength to dissolve gold and silver. Assays of ore gathered from this tunnel ran as follows:

| | Gold. | Silver |
|---|---|---|
| At the entrance | $26 | 11 |
| Ten feet from entrance | 51 | 13 |
| Twenty feet, next blue clay | 86 | 16 |
| Blue clay | 103 | 13 |
| Ledge, back of clay | 206 | 16 |

The ledge rock was broken from the outside with hammers, as no blast has been put in. The top of the tunnel is in no place more than ten feet below the surface. The bed of chloridized matter is of an average width of 100 feet, and if the surrounding formation is taken as a guide it reaches hundreds of feet deep. This property, along with the Oxide claim, which adjoins it on the north, was purchased last week by Q. R. Smith, a capitalist of Santa Ana, Cal., for $20,000. He expects to commence operations as soon as he has demonstrated the proper treatment for the ore.

Near the river, directly east of Mr. Smith's property, is a shaft forty feet deep, owned by Mr. Worthing. They have been digging through a decomposed quartz colored with red oxide, but have now struck a ledge of solid quartz of a dark blue color, filled with sulphurets. The ledge is between granite walls and has a layer of hard blue clay about four inches thick. Between the south wall and the quartz this clay hardens on exposure to the air. There has been no assay made of the blue clay and I failed to get the assay from the ledge. A double shift will be put on the shaft next week.

Aside from what I have mentioned there is no work being done. It is rumored that the Geneva Co. will begin development work in a few days.

At the present time this is no place for those seeking employment, as the camp is too new, and it will require capital to develop and open up the bodies of ore; and until something more is known as to the richness of the deposits I would advise all poor people to keep away. C. DEWITT CHAPMAN.

Escondido, San Diego Co., Cal., Feb. 1, '96.

**Shasta.**

REPORTED SALE.—It is stated locally that the Bully Hill mines at Copper City, on Pitt river, twenty-five miles northeast of Redding, have been sold by Hugh McDonnell and James Sallee to a syndicate of New Jersey capitalists for $300,000. They had a bond on the Bully Hill mines, and did considerable development work. The ore carries gold, silver and copper. It is also reported that a smelter will be erected and a railroad built up Pitt river from the Southern Pacific line to the mines. Mr. McDonnell denies the report.

**Sierra.**

*Herald*: The North Fork drift gravel mine, near Forest City, is in rich gravel. Superintendent J. O. Jones says the gravel is four feet thick, that it prospects well and is getting coarser as he runs into it. He will build a dump and flume and go to washing at once. The North Fork Company has spent a year and a half in running this tunnel, and while such an operation costs a good deal of money, it is said that this tunnel was run cheaper than any of its size in the State. It was quite an undertaking and required considerable nerve to run a tunnel for 2000 feet, much of it in bad ground, and take chances on "striking it" or not striking it.

LATEST MINING NEWS.—*Enterprise:* There are thirteen men working at the Sierra Buttes and four in the Bigelow quartz mines near Sierra City.

More men are being put on at Thistle Shaft, and 100 men employed. The mine is yielding good dividends.

There was a cave in the main tunnel of the Bald Mountain Extension drift mine last week, and some of the workmen were laid off temporarily until the right of way was again secured.

The Rising Sun and Early Dawn Consolidated drift mine, just below Sierra City, has been bonded by S. Uren of that place to R. E. Neil of San Rafael and G. W. Hansbrough of San Francisco, and 7600 feet of channel were located by them. Six men are employed. Incline is down 60 feet and will double this distance. The channel is 500 feet wide, five-sixths of the width of the Thistle Shaft, or Feather River Co.'s, near Gibsonville, owned by Scotch capitalists. G. W. Hansbrough is superintendent.

**Siskiyou.**

GENERAL NOTES.—*Journal:* The Distlehorst Mining Co., comprising J. and C. Distlehorst and H. J. Barton, has been formed and will commence operations in the Klamath river as soon as possible. The Distlehorst Bros. have been working their dredger in the Sacramento river for the last four years, and have been very successful. Last summer they cleared about $8000 in the Sacramento river above Redding, and say the Klamath river may be just as easily worked as the Sacramento. The new company is to be furnished with 30,000 feet of lumber by LeDuc & Maltby, with which the dredger will be built. The machinery will be made in Redding, and will be finished so work can be commenced on the boats, just above Oak Bar, by the first of April, and by the first of next August the plant will be ready for operation. The dredger will handle one cubic yard of dirt at each trip, and if it pays 15 cents to the yard it is a paying proposition, but all who are familiar with the rich deposit of gravel in the Klamath know that it will average much better than that. It takes three men to operate the plant, who will be at work on eleven hour shifts. The dredger will make forty trips an hour at a depth of twenty feet. The great difference between this new plant and the old derricks, which the China claims along the Klamath have used, and which have heretofore been considered the most practical way of mining the river, can be noted, as it takes eleven men to run one of those derricks, which will hoist only twenty tubs an hour, with one-half cubic yard to the tub. The new plant will be operated by a twenty-five H. P. engine, and the entire expense will be $500 a month. H. J. Barton, who is a member of the new company, visited Redding a short time ago, and after seeing the dredger in operation knew it would work in the Klamath, as he is thoroughly familiar with the river. This will doubtless be the means of making the Klamath the greatest gold-producing section in the county.

The Eastlick Bros. are about to start up their hydraulic mine at Oro Fino. They will have plenty of water and will keep a large force busy, every indication pointing towards a most prosperous season. This mine paid exceedingly well last year, but the owners hope to do even better this season.

The Wright & Fletcher mine, which adjoins the Eastlick mine, will also be enabled to do more work with an abundant supply of water. These claims are among the best hydraulic mines in the county.

The Mabel mine, owned by Chamberlain & Timmons, and over which there has been some trouble regarding the claim of a former partner of Chamberlain, will be started up when the matter is settled, which will probably be some time yet. The Mabel mine paid exceedingly well last year, and will doubtless prove as rich another season.

All the other miners in the vicinity of Oak Bar and Scott Bar anticipate a prosperous year, and will commence operations early in the spring.

The miners on Beaver creek have been unable to do much yet, as the supply of water is not very plentiful. Some ground sluicing has been done, but very little other work. It has snowed considerably in that vicinity, and, although it does not furnish much water now, will be of great benefit in the spring.

None of the miners along the Klamath river have been able to do anything yet, owing to the high water. If no more storms occur they will be able to start up in a short time.

C. B. Jillson of Henley has four men at work at his blue gravel mine near that place, but has been unable to make much headway yet, owing to the storms and cold weather.

**Sonoma.**

Messrs. Burton and Hopkins in Dry Creek valley, are reported to have struck a ledge yielding sufficient gold to justify them in talking of putting up a mill.

The Healdsburg paint mine is shut down; the machinery is being overhauled and put in shape for a season's run.

**Trinity.**

COFFEE CREEK.—Amos Hill has a tunnel in 250 feet on his mine on Coffee Creek, Trinity county, near Carville, and is taking out some rich ore.

Mr. Bighouse has erected an arrastra on his mine. He and his company are running two tunnels on the property. The ledges are paying well.

The Rainbow Mining Company has been working two years with discouraging results until within the last two weeks.

George Carr on his mine on Coffee Creek has an arrastra. The ore mills $85 per ton.

The deal of the Bloss & McCleary placer mine will be closed this week. It will go into the hands of a wealthy Eastern company.

The Nash placer mine, owned by an English syndicate, at the head of Coffee Creek, is being developed. Fourteen men are employed and bright prospects ahead.

**Tuolumne.**

Talking of Tuolumne county's rich mines, a newly formed development company says: Among the fine mines now in active operation within a radius of 12 miles of Sonora are the App mine, situated on the "mother lode," with a quartz vein from 5 to 20 feet wide; ore, very rich; mine considered worth several million dollars.

The Rawhide mine, three miles from Sonora; $2,200,000 were refused for this mine within the past three months; owned by W. A. Nevills and others.

The Golden Gate, a purely sulphuret mine; no free gold in sight; is yielding hundreds of thousands every year; owned by Golden Gate Mining Company, Sonora.

The Dead Horse mine, vein 5 to 25 feet wide, has yielded over $11,000,000, and is considered as good to-day as ever; situated nine miles from Sonora; owned by Haywards & Co., San Francisco.

The Golden Rule mine, four miles from Sonora, is also one of the rich mines of that locality.

The Confidence mine, seven miles from Sonora, has yielded over $6,000,000; shut down years ago; worked only about 700 feet below the surface; vein lost; owned by Baker & Hamilton, San Francisco.

The Green mine, Sonora, paid $100,000; closed down with vein lost; mine only worked to a depth of 240 feet; worked in early days.

The Excelsior, eleven miles east of Sonora, turned out $420,000 during 1866-7 and 8; was only worked 200 feet below the surface; vein lost; mine lying idle since 1868.

The Soulsby mine, location Soulsbyville, eleven miles from Sonora, yielded over $6,000,000, owned by William Sherwood, Soulsbyville, California.

The Bonanza mine, in the town of Sonora, has yielded over $2,000,000.

The product of Table Mountain alone, which runs through a portion of Tuolumne county, is estimated at $15,000,000.

**NEVADA**

LINCOLN COUNTY

Montgomery district contains about 100 tents. All the mining property there is owned by a Utah company, which pays $3.50 a day wages.

EAGLE VALLEY.—A *Tribune* correspondent says the Eagle valley discovery is a continuation on the southeast of the Spring Valley, and prospectors who have gone over the country say the ledge is now discovered and located for twenty miles. At the miners' meeting held here last Monday for the purpose of organizing a mining district, it was decided to organize on the Utah side and call the district "Line." The by-laws were framed and patterned after the Ely district code, and Nelson Millett was elected district recorder. Wood and water in great abundance in the new mining field add to the anticipated activity with a little more development of the properties. A town has been laid out, part of it in Utah and part in Nevada.

**OREGON.**

COPPER MINES.—The Kerby *Union* says that "owing to the fact that the trail to the lower copper mine is in bad condition, the men will soon be moved to the mines at Waldo, where they will work this winter. Having smelted a few twenty-five-pound mattes of copper, the company is satisfied with its progress so far. The men in charge of the work on this claim and at Gold Basin seem to have grown rich and deserted the mines. Foreman Simmons has left the copper company and will take charge of work on the Yank gold ledge. C. E. Phillips, of the Gold Basin, has purchased a claim for himself and is now working it, while C. C. Russ has given up his superintendency of that mine and will locate in Kerby. It evidently pays to have charge of development work for big companies."

BAKER COUNTY.

A Baker City dispatch says: Superintendent McNally is in from the Virtue mine with several sacks of the richest ore ever taken out of the mine. Fifteen thousand dollars is said to be their value. He also brought in a $13,000 gold retort. The Bonanza the same day sent in a $4500 gold brick.

**WASHINGTON.**

About thirty men are employed in getting out silver ore in the North Star group of mines. They are extracting from twenty-five to thirty tons a day, and expect to have over 3,000 tons ready for shipment in the spring. The property consists of four 1500-foot claims, situated about twenty miles northeast of Fort Steele. The works extend over 400 feet of the lode, and one drift shows solid galena and carbonates for the remarkable width of 65 feet. Assays run from 48 to 85 ounces in silver, 67 per cent lead.

The Cowlitz *Advocate* says the St. Helens Mining Company will spend $20,000 on its mines in the St. Helens district this summer, and that a number of other companies will develop their properties.

**UTAH.**

A GREAT PRODUCER.—*Tribune*: With yesterday's distribution of 10 cents a share, or $15,000, among the stockholders, the dividends paid by the Ontario Silver Mining Company reached a total of $13,190,000, and but for the slump in silver, to which so many bonanzas succumbed in 1892, the amount would have reared itself to over $15,000,000.

The story of the Ontario is the story, perhaps, of no other bonanza. It was located by a prospector, who, like a wandering minstrel, walked, fiddle in hand, into what has since developed as Park City, one day and drove his stakes. At the outcrop rich ore was to be found, but without means to go down upon it, the minstrel sold it out for practically the song that his improvident expenditure of the few hundreds he obtained for it inspired at the bar that night. Then it went into the hands of John Wallace and Al Guiwitz. These gentlemen began its development and had disclosed pay ore when R. C. Chambers, its present superintendent, detected what he conceived to be a promising thing, and after several weeks he procured an option on it for $30,000. He commended it to George Hearst and J. B. Haggin, and these gentlemen, relying on his judgment, scooped it in. Then the systematic development of the property was begun. In a few weeks the production of ore was begun, the purchase price was restored to the pockets of those who had paid for it, and without an assessment having been levied on its owners dividends began. Millions piled upon millions until October, 1892. Then the market went to pieces. The month before its stockholders had divided $75,000. Silver, prior to that time, had averaged about $1 an ounce, but began to steadily decline, and Superintendent Chambers recommended that dividends be suspended and that the energies of the company be concentrated on the plan which had been previously outlined by him to produce the ores at a less cost. The main feature of this was the driving of the great drain tunnel to connect with the 1500-foot level in the mine, which was accomplished in October, 1894, after 15,494 feet of rock had been penetrated at a cost of $30.12 a foot, or a total of $466,753.79.

All the while this was being done the extraction of ore was going on, but with the market value of silver at less than 70 cents, dividends were then out of the question and the operation of the mine was confined to the exploration of new ground and the acquirement of facilities for the more economical handling of the ores. It is estimated by Superintendent Chambers that through the decline in silver since 1892 the company has sustained a loss of $1,588,796, which would have otherwise gone to the stockholders. At present the ore bodies are intelligently blocked out, the means for handling them are perfect, and the bonanza may be relied on for a repetition of yesterday's dividend with the assurance that it will be increased as the price of silver justifies. A bid of nearly $10 a share was made for the stock on the local exchange yesterday, but the only offering was at $11.50.

**IDAHO.**

FORTY MORE STAMPS.—The Wood River *Times* hears that George A. Williams will the coming summer add forty stamps to the mill of the Atlanta Gold Mines Company. This will give employment, at good wages to a large number of men.

IN POSSESSION.—A Silver City dispatch states that the men in the Morning Star mine have driven off Superintendent John Nugent and taken possession. They claim that a large sum is due them for wages and they propose to take out the ore and pay themselves. H. W. Barry, principal owner and manager, is in Denver negotiating for a mill to erect on the property.

**MONTANA.**

CLOSED DOWN.—A Butte dispatch says the Bluejay, Silver Bow and Gray Rock mines of the Butte & Boston group have closed down and over 300 men are thrown out of employment. It is understood that the management is after some high-salaried heads that are not needful. The pumps have not been withdrawn from the mines, which shows that the shut-down is only temporary.

SELF-DUMPING SKIPS.—*Inter-Mountain*: With the new and improved hoisting machinery in use at the mines of the Anaconda Co. the need is felt of some apparatus for hoisting and unloading the ore more speedy and economical of labor than the old slow-going cages, which require the services of several topmen and carry but a limited quantity of ore.

It is understood that the future will witness some important changes in the present methods, and it is said that the company will very soon introduce self-dumping skips or "giraffes," as they are called in the Lake Superior country, where they are largely in use in such mines as the Calumet, Franklin and Quincy, and also in the iron mines of the same region.

These skips are the full size of the shaft and are mounted on solid wheels, which revolve in guides on railroad iron. The only mine in this district in which anything like these skips are in use is at the Gagnon, and, as employed at that mine, are said to give much better satisfaction than the old-fashioned cage.

It is said that the first test of the new skips will be made at the Green Mountain.

**COLORADO.**

MINES SOLD.—The Easter Bell group of mines on Bull hill, near Colorado Springs, are reported purchased by a New York firm for $100,000. The Little Johnny has also been bought by Eastern capitalists for $80,000.

**NEW MEXICO.**

At Pinos Altos all its mines and mills are either at work or preparing to commence operations. The Bell and Stephens, Pacific, Western, Atchison, Deep Down, Mountain Key and Golden Giant are working full handed and with gratifying results. The Golden Giant shaft is now down 320 feet and good ore is in sight. The Mammoth mill has been put in and will start up this week. There are fully 200 miners at work in the camp and times have not been so prosperous for the past ten years.

MOGOLLON.—The new ore body in the Confidence is turning out as good as first indications promised. The mill is daily crushing seventy-five tons.

**ARIZONA.**

MOJAVE GOLD CO.—T. S. Bailey has been opening the Mohawk mine, near Tucson, for the past three years for Eastern capitalists and is completing a twenty-stamp mill, which he expects to start up about the first of March.

AT GLOBE.—*Belt*: The United Globe mines blew in their first furnace last week; 9000 pounds of copper were run out the first day. Sixty-five tons of ore is the daily requirement, supplied from the various mines owned by the company; the Buffalo is now supplying three-fourths of the ore smelted. The ore averages from ten to fifteen per cent copper. Within a few weeks a new furnace will be erected; the present force numbers more than 100 men. E. H. Cook is general superintendent.

AT CONGRESS.—Corr. *Miner:* The Planet-Saturn is down 125 feet on the main shaft. The ore streak is 3 feet wide in the bottom and goes $20 per ton. The shaft is equipped with a large hoisting engine and a 50-horse power boiler, besides a Westinghouse engine to run an 18-inch blower. They expect to sink the shaft 600 feet. Shaft No. 2 is down 200 feet, and the ore streak is from 4½ to 5 feet wide. They have drifted 200 feet west toward the main shaft, and the ore body is about the same width as in the shaft. The second shaft is equipped with a Davis horse whim. There are between 700 and 800 tons of ore on the dump, which is all of a good milling grade; they also have many tons sacked ready for shipment, which runs about $150 per ton. All this ore was taken from sinking these shafts and drift. These mines could keep a large mill going when stoping is begun. They employ 24 men and run eight-hour shifts.

The Yarnell mill is running night and day. They employ eighteen men. The workings are down 375 feet on a streak of ore from 6 to 8 feet wide. The Juniper is also showing up well. They are working ten stamps on it.

## Coast Industrial Notes.

—Discouraged by various frosts, there is an exodus of Florida orange-growers to California.

—An agent of the Chinese Government is reported to have arrived on Puget Sound to place an order for 50,000,000 feet of lumber.

—Tucson, Ariz., has petitioned Congress to authorize an issue by that city of $100,000 five per cent bonds for municipal improvements.

—Mr. Hammond, the builder, says he will have the railroad, 56 miles from Gobel to Astoria, Oregon, completed by the first of next October.

—The new electric railway from this city to the Cliff House on the ocean beach was formally opened last Saturday and is now in successful operation.

—The Ilwaco Railway will be extended along the north side of the Columbia river, Washington, from the present ocean terminus to Knappton, a distance of ten miles.

—The Continental Motor and Traction Company has incorporated in this city. Directors, Philip La Montague, W. R. Smedberg, A. J. Bowie, G. I. Ives, W. B. Harper; capital stock, $1,000,000, of which $35,000 has been subscribed.

—The Pacific Coast Trading Company reports having shipped from Fairhaven, Wash., during 1895, nearly 300,000 pounds of fresh fish, for which the fishermen received $7000. The principal shipments were of silver and steelhead salmon.

—Dr. E. H. Stanley of Port Angeles, Wash., who has given the subject considerable study, proposes to undertake the propagation of Eastern oysters on a branch of Puget sound, and has leased 400 acres in which he will plant a carload of Eastern oyster seed.

—The capital stock for the new Santa Cruz Electric Power Company on Big creek has been subscribed. Contracts for grading the flume line and placing the poles between Santa Cruz and Big creek will be let next week. The woak is to be completed by July.

—In San Diego the proposed bond issue is $1,575,000, which, with interest at 5 per cent, would mean $78,750 per annum, and, as one-fortieth of the principal must also be paid each year, the first payment necessary for the redemption of bonds would be $39,375, making a total of $118,125, but with a reduction thereafter of interest as the yearly installments of principal were paid.

—A. W. Jones, president of the Monterey and Fresno railroad, is in the East to effect the sale of $200,000 worth of bonds in New York. It is stated that $400,000 worth of bonds have been sold locally, on condition that he sells $200,000 worth more in the East. It is also stated that an Eastern firm has agreed to undertake the construction and equipment of the road from Monterey to Hollister.

—"The Central Lumber Co. of California" is the title of the lumber trust or combine of the coast lumber dealers, which is represented to have a combined capital of $70,000,000 and which now includes the principal lumber mills and wholesale and retail lumber dealers in Washington, Oregon and California. An advance of $2 per M feet is the first thing reported to be in order. The output for '95 was 600,000,000 feet. The proposed advance would represent on that output the comfortable addition of $1,200,000.

—The following is clipped from the current issue of the *Railway World:* "The Pacific Mail Steamship Company, which is owned by the Southern Pacific Railroad people, has issued a new tariff sheet announcing an advance of seventy per cent in freight rates from this port to New York. This advance marks the end of the war which the shippers of San Francisco began several years ago against what was considered the extortionate charges of the Southern Pacific, and rates will go back to the old figures."

—The action of the State Architect and the Capitol Commission specifying that oak be used in the State Capitol has thoroughly aroused the lumbermen of Washington. One bidder said an oak floor would cost $15,000 more than fir and would not last as long. What makes the millmen angry is that, in all Eastern States, Oregon and Washington fir is in great demand for the very purposes for which oak is supposed to be desired. The Gray's Harbor Company declares it will be an everlasting disgrace to the coast if the specifications are not changed to admit the use of native woods.

—Over 800,000 olive trees have been planted in California since '94. As many more young olive trees will be planted this year. The total olive orchard area of trees is 21,000 acres, valued at $5,000,000—5,000 acres being in full bearing, with a yield for the last year valued at over $200,000. The crop is gathered in November and December, and the processes of pickling the fruit or extracting the oil at once put under way. The demand for California olive oil has been such since 1889 that the whole product has been sold almost as soon as offered. Last year's product was about 75,000 gallons. The United States has been importing annually 850,000 gallons of olive oil, with a great deal of cheap adulterated oil.

—In northern and central as well as southern California the importance of the beet-sugar industry is being understood. New factories are projected and considerable capital is being invested in machinery and land. The crop of beet sugar in Europe for the season of 1894–1895 reaches 4,800,000 pounds. This is an increase within less than twenty years of about 350 per cent, due to the fact that the industry is more profitable to those engaged in growing the beets and in manufacturing sugar from them than are other easily available industries. Every leading continental nation in Europe has legislated carefully to foster their sugar industry. It is estimated that France has paid in bounties on sugar produced $10,000,000; Germany nearly $6,000,000; Belgium $5,000,000, and Austria $2,000,000. Russia, Sweden and Denmark have also paid bounties. The consumption of sugar in Great Britain and the United States is seventy-nine and seventy-seven pounds, respectively, per capita, while the consumption figures for France, Austria, Germany and Belgium are, respectively, thirty, twenty-nine, twenty eight and twenty-two pounds. Statistics for the last four years show that the production of beet sugar has advanced enormously, while that of cane sugar has made but little gain.

—Mexico shows an increase in imports of cotton goods during 1895, as compared with the previous year. The imports for 1895 were 51,470,100 yards, against 29,471,400 in 1894, and during the past year cotton mills and prints works are running extra hours to supply the demand which they could not meet. The importation of print goods rose from 9,748,700 yards in 1894 to 17,368,400 in 1895. Railway iron and steel imports are about the same, but will increase this year, owing to renewal of every construction. The Government has approved plans for a portion of the new extension of the Mexican Central railway west from Guadalajara.

—During '95 there were 649 commercial failures in California—519 in the State and 130 in San Francisco. The greatest number of failures, 160, occurred in the general merchandise business. There were 139 failures in the grocery business, 55 in the furnishing goods, 48 in the dry goods, 33 in the hardware business, 21 in the boot and shoe business and 18 in the liquor business. The failures occurred in the leading counties as follows: San Francisco 130, Alameda 36, Butte 12, Fresno 14, Humboldt 12, Los Angeles 25, Sacramento 19, San Bernardino 11, Santa Clara 12, Santa Cruz 10, Solano 10, Sonoma 16, Yolo 10, San Mateo 1, Orange 1, Marin 6, Contra Costa 6, Amador 4, Calaveras 5, Siskiyou 6.

—The following bids for completion of the Washington State Capitol were opened this week: Brigham & Lillis, Tacoma, $781,555; Nichols & Crothers, Tacoma, $795,728; Anton Berens, Tacoma, $806,112; John Keenan, Spokane, $818,000; F. H. Goss, Tacoma, $822,951; Fotheringham & Huber, Spokane, $828,000; Huestis & Barrett, Olympia, $839,500; L. L. Teach & Son, Chicago, $886,983; Vulcan Iron Works, Seattle, $892,070; Philip Buehner, Spokane, $903,000; N. J. Blagen, Portland, $997,000. The contract for the completion of the State Capitol was awarded last Wednesday to Fenton H. Goss of Tacoma for $822,951. The structure will cost $1,000,000, of which about $80,000 has already been expended on the foundation and other work. The building will be of white sandstone, quarried near Tacoma.

## Commercial Paragraphs.

THE old established Nevada Metallurgical Works, Taylor & Ward, proprietors, have removed to more commodious quarters, 71 and 73 Stevenson street.

A SCHEDULE of the course of the School of Mechanical Engineering, the Lehigh University, South Bethlehem, Pennsylvania, practical in its nature, illustrated, has been received.

THE Scientific Machinist Co., Cleveland, Ohio, sends a handsome 52-page illustrated catalogue descriptive of the Institute for Home Study of Engineering and of electrical apparatus for its students.

THE Colorado Iron Works, Denver, has issued a neat pamphlet, designed especially for engineers, "Explaining Ore Crushing Machinery for Concentration, Amalgamation, Cyanide and Chlorination Plants."

THE Westinghouse Electric and Manufacturing Company of Pittsburg has received a number of awards at the Atlanta Exposition for the handsome exhibit of electrical apparatus made. Several gold and silver medals are among them.

THE Pelton Water Wheel Co. report the usual activity in their business. Among recent shipments may be mentioned a 1000 H. P. wheel for operating an electric transmission plant in Mexico, a 300 H. P. wheel for an electric power plant in Japan; also six wheels of various capacities to the new mining districts of British Columbia, as well as several to Idaho, Montana and Colorado.

## New Mining Incorpoations.

THE Deer Park Gold Mining and Milling Company, San Diego: capital stock, $100,000; subscribed, $98,000; C. W. Byler, C. M. Walker, J. F. Forward, E. E. Shaffer, T. J. Storey, of San Diego, directors.

THE Mother Lode Gold Mining Company: directors, W. Irelan, A. H. Ricketts, L. C. Parke, L. Neuman, L. Slesinger, M. M. Stern; Crocker Building; to develop the Vulture, Price and McNamara mines, Amador county.

**TUBBS CORDAGE CO.**
(A CORPORATION.)

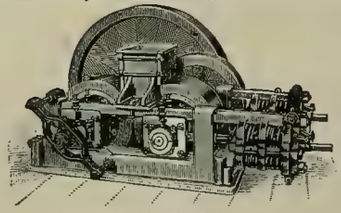
Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc. ☞ Extra sizes and lengths made to order on short notice
**611 and 613 FRONT ST., San Francisco, Cal.**

**Notice to Artesian Well Borers.**

I have here Artesian Boring Machines and I wish a competent man to work them. For particulars, address L. DUTERTRE, Golconda, Humboldt Co., Nevada.

This doesn't happen every day. You can't expect it more than a few times in a lifetime. No one is going to agree and guarantee positively to save you 30 per cent or else no pay unless they know what they are about. You can't expect people to say, "You need not pay for this until you have proved our guarantee," unless they intend to do all that they claim. As a matter of fact, we do more than we claim. We guarantee to save 30 per cent, but actually we save a good deal more.

Have you ever heard of a Double Pipe Air Compressor? It has one disadvantage. It needs twice as much piping as is needed with the ordinary makes of Air Compressors. On the other hand, it has more real, genuine advantages than you can shake a stick at. It will do the same work as the ordinary Air Compressors, such as are in general use throughout the mines on this coast, on 30 per cent less power. We will guarantee this and prove it to your satisfaction, else you need not pay for the Compressor. It weighs less than half as much as the ordinary Air Compressor. It costs less for freights and is more easily carried up into the hills. It shows the same high efficiency at all altitudes, high or low. It takes no more fuel to do the work if located on the highest peak of the Sierras than it would take if located at the sea level. It enables you to buy a smaller boiler than you can use with any other Air Compressor to do your work. It does not overheat the air at the Compressor and freeze it at the rock drill. In short, it is the ideal Air Compressor. It has been tried in practice, and we can show you the highest recommendations and endorsements. We sell it on a strict, positive, iron-clad guarantee If your power costs you anything, you want the Double Pipe Air Compressor, because you can buy it on a guarantee that it will run on 30 per cent less power than any other make of Compressor. If you have to take a Compressor to your mine over bad roads, you want the Double Pipe Air Compressor, because it weighs less than half as much as any other Compressor. It is cheapest to buy, cheapest to run, cheapest to transport, cheapest to carry anywheres. For pumping it beats the world. You can run it with steam or water.



Write to the Pneumatic Power Co. for further information. If you are in the city and want a compressor, call and see them. They will show you the Double Pipe Air Compressor in operation. Remember you run no risk. We claim wonders, but we have to perform wonders in Air Compression, or else you don't have to pay for the machine. We are ready. Are you?

Pneumatic Power Co., 306 Pine St., Room 10, San Francisco, Cal.

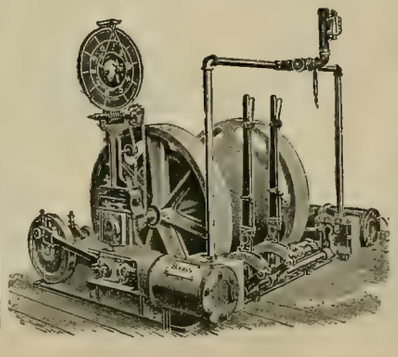
### Improved Self-Contained Three or Five Stamp Mill,

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics' labor in framing and erecting.

THIRD: The large amount of space saved.



FOURTH: The great saving of freight.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR THE WEEK ENDING JANUARY 28, 1896.

553,636.—LOW WATER ALARM—O. J. Backus, S. F.
553,639.—SEWING MACHINE—E. O. Bennett, Haywards, Cal.
553,796.—WHEEL—Di Vecchio & Coward, S. F.
553,613.—ENGINE—E. W Hammon, Davisville, Cal.
553,649.—FRUIT PITTER—A. Harpold, Los Angeles, Cal.
553,571.—SEED RACK—J. Sproule, S. F.
553,795.—SNAP HOOK—W. G. Tower, Murietta, Cal.
553,631.—SCHOOL DESK—C. B. Towle, Vallejo, Cal.
553,727.—SPRINKLER.—J. P. Van Sickle, Los Angeles, Cal.
553,633.—TELEPHONE DIAPHRAGM — E. Wescheke, S. F.
553,634.—AMALGAMATOR—S. A. West, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GAS ENGINE.—Samuel M. Miller, Stockton, Cal, assignor to Kroyer, Mayes & Jackson of the same place. No. 553,352. Dated Jan. 21, 1896. This invention relates to improvements in gas engines. The object is to provide in an engine of this class, means to produce a practically double-acting engine. It consists essentially of a cylinder or cylinders closed at both ends; a piston reciprocating therein and connected with the crank shaft; air inlet and outlet valves and passages connecting with one end of the cylinder, whereby the piston acts as a pump to draw the air in during the in-stroke, and to force it out through the outlet valve during the out-stroke; a carburetor and receiver into which the air is forced under pressure, and in which the explosive compound to be used in the engine is produced; a valve chamber communicates with the opposite end of the cylinder, and is provided with a suitable valve and mechanism by which it is operated so as to admit a charge of explosive gas from the receiver to that end of the engine cylinder, this gas being admitted under such pressure that it will serve to start the engine by pressure alone. In conjunction with this are stationary and movable electrodes forming an igniting device by which the charge is exploded so as to force the piston to the outer end of its stroke. The engine is also constructed with two cylinders in line, each of which is constructed similarly to the above, and their pistons and piston rods being connected by suitable slide rods they operate together, and alternately receive an impulse so that the operation of the engine is more regular and continuous.

BEER DRAWING APPARATUS.—George Williams, San Francisco, Cal. No. 553,376. Dated Jan. 21, 1896. This invention relates to the class of devices for handling and dispensing effervescent beverages, particularly beer. Its object is to draw beer or other effervescent liquid directly from the keg or other receptacle into the tumbler without foaming and without loss of too much gas, thereby keeping it lively and sparkling. The apparatus consists of a frame having a fixed plate provided with a valve port, a vertically movable support below, means for clamping the tumbler and sealing it between its support and the fixed plate, a hermetically sealed chamber standing in line with the tumbler, and a circumscribing wall, said chamber communicating with the tumbler through the valve port in the fixed plate and a tube passing through the chamber and fixed plate, whereby communication is established between the source of supply and the tumbler.

SCHOOL DESK.—Charles B. Towle, Vallejo, Cal. No. 553,631. Dated Jan. 28, 1896. The objects of this invention are to increase the capacity of the desk, to afford comfort to the pupil and to provide for economy in its manufacture. Other objects are to detachably fix the desk to the floor so that it may be perfectly stable while in use, and yet may be readily removed by the janitor, to avoid noise in the manipulation of both the seat and sliding top, and to avoid any loose parts which may be taken from the desk. The several improvements in the desk have in view these objects and relate generally to the adjustable seat, to the adjustable back rest, to the manner of mounting and manipulating the sliding top, and to the shoes by which the feet of the desk are detachably connected with the floor.

# HAMMOND M'F'G. CO.

DETACHABLE BUCKET WIRE-ROPE TRAMWAYS,

Roller Grinding Pans, Desulphurizing Furnaces, Etc.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

Patented in the United States and Foreign Countries.

**The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.**

**FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.**

**SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.**

**THIRD: The Large Amount of Space Saved.**

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

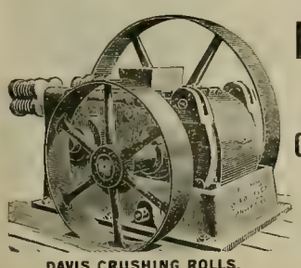
F. A. HUNTINGTON'S NEW IMPROVED

# Centrifugal Roller Quartz Mill.

This Improved Mill has the following advantages over my Geared Mills, viz:

1st.—I dispense with the wooden frame with posts and set the mill on heavy timbers or a concrete foundation, thereby securing a solidity that cannot be attained when set on posts.

2d.—I dispense with gearing and drive direct from the pulley.



3d.—There are five less places to oil.

4th.—The Mill is built much heavier and stronger than the former ones.

5th.—Being heavier and set on a solid foundation, it can be run much faster, thereby increasing its crushing capacity in the same proportion as centrifugal force is increased by increased velocity.

SAN FRANCISCO, CAL.

READ WHAT MINERS THINK OF THE BRYAN IMPROVED ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CASDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 40 mesh screen. Our mills run 35 revolutions per minute, and each crush through 20-mesh screens 12 tons in 24 hours; through 30-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 2000 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2200 to 2300 tons.

The mills require very little attention. At our mill an ordinary peon, earning one dollar per day, has complete charge.

In regard to slimes, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a much less amount of slime is created. A three years' experience teaches me that in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK, Pres.
SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly,

JOHN BECK, Pres.
SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY,
S. BAMBERGER, President and Manager.
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,
[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO,
C. C. MCIVER, President; D. CUSHMAN, Secretary.
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year.

CHAS. C. MCIVER, President.

# Market Reports.

## The Markets.

SAN FRANCISCO, Feb. 6, 1896.

Metals are steadier and prices firmer. In structural material California's dependence upon the East militates against the State's industrial progress. Elsewhere is given extended notice to a Nevada county iron deposit. A silver free coinage bill has passed the Senate, but it is meaningless, as it cannot pass the House and the inevitable presidential veto. Still, silver is all right and will win yet. Copper shows renewed strength. All the other metals are practically unchanged, lead showing the least life of any on the list. At the recent secret meeting of Bessemer mine owners held in Cleveland, Ohio, to decide on the proportion of ore to be turned out by the various ranges during the coming season, the total amount to be shipped is fixed at 10,000,000 tons, or 200,000 tons less than was shipped during the last season. The miners realize that when there is a surplus piled upon the lower lake docks, it acts as a price cutter.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from G. M. Coney and W. S. Adkins, in the Coney mine, near Oro, Shasta county, to deposit tailings in the ravine below the mine; from H. L. Van Eman, in the Gorman mine, near Michigan Bluff, Placer county, to deposit tailings in Skunk gulch; from O. H. Simons, in the Princess mine, near Redding, Shasta county, to deposit tailings in a ravine and in a dry gulch; from John Sybel, in the Proper mine, near Murphys, Calaveras county, to deposit tailings in a ravine below the mine; from Gianini and Poggi, in the Nigger Ranch mine, near Grizzly Flat, El Dorado county, to deposit tailings in a ravine below the mine; and from E. S. Thompson and G. E. Hill, in the No Chunk mine, near Michigan Bluff, Placer county, to deposit tailings in Skunk gulch, gives notice that a meeting will be held at room No. 92, Flood building, San Francisco, Cal., on February 10th, 1896, at 1:30 P. M.

## Mining Share Market.

SAN FRANCISCO, Feb. 7, 1896.

As indicated in last week's MINING AND SCIENTIFIC PRESS, the market strengthened slightly, then weakened off up to Tuesday noon, when a stronger tone set in, followed by a slight advance. In the upmove Occidental and the middles did the best. The way in which the market is being handled ought to create a feeling of caution, for almost any day a bear raid might set in and prices be sent down twenty, or even more, per cent. There does not seem to be any element of strength, or, at least, it is not sufficiently pronounced to cause dealers to entertain the hope that anything of importance is at hand now. While saying this, the writer still holds to the opinion that 1896 will witness much higher prices than have ruled at any time within the past two years, and, if conditions are favorable, for over five years. This opinion is grounded on the conditions of the mines, the money markets in the United States, improving business and the people ripe for speculation. From one end to the other of the Comstock the mines were never in such favorable condition for being worked advantageously. For over eight years there have been run drifts, cross-drifts on several levels, upraises made and winzes sunk, so as to put the mines in the best possible condition for working. This work has not been done for no purpose, as it is the groundwork for more work when John W. Mackay and his associates get ready for business. When this time will come it is hard to say, but it looks as if it will set in some time in March. The money markets in the United States were never so easy, with the rates of interest favoring borrowers who can give gilt-edge security. That there is an abundance of money waiting investment is witnessed by the large number (4640) of persons and firms that put in bids for the Government new bond issue. Although the number of bidders was large, yet the amount subscribed was unusually large. Although the loan was only for $100,000,000, yet the amount subscribed was over $550,000,000. This country is full of people ready to invest or to speculate. The business of the country is steadily improving, and it looks as if it will continue to enlarge, notwithstanding that this is presidential election year. This is also an important sign in favor of a share deal. And then there is another thing. Reports are being circulated that the stock boards will close. In former years it was that the Stock Exchange building was going to be sold, and this almost invariably produced an upmove. Then there is another thing—the Exchange is reducing expenses.

From the mines there is everything to warrant the expectation that when the powers that be get ready, something of importance will be found in two or more of the mines. In these very mines they are "monkeying" around the vicinity of a considerable body of ore—enough to promote a good-sized deal, even if the propositions should not be backed by moneyed men. It may be before this ore is accidentally found Con. Virginia and several other companies will levy assessments. In the Alta group nothing of importance is reported and none looked for until after assessment sale-day, and not even then unless some of the outside holders give up their shares. In the Gold Hill group of mines there is the usual work under way, some of quite an important character, particularly in Belcher, Crown Point and Yellow Jacket. As Crown Point is collecting an assessment, it is not likely that enough ore will be found to excite the cupidity of buyers. Something good ought to come out of these mines before the spring months pass. Challenge and Confidence, that promised such great things, are virtually "dead letters." It is singular what became of the ore that was found and on which the shares sold at considerably higher prices. It is still in the mines, unless the Yellow Jacket people got in and took it out. The work in Con. Imperial is still making snail progress. The management may perhaps strike the ore they are running for before death overtakes them. In Alpha the water-strike has disappeared as mysteriously as does a Comstock ore-strike. They are still working in the vein, or, at least, were at last accounts. The work in Potosi, Chollar, Hale & Norcross and Savage of the middle group ought to show up better before long. Ore is being extracted in the first three, which helps to pay expenses. It is even stated that Hale & Norcross more than pays expenses. From the character of the work under way better things ought to be the order before long. From Gould & Curry and Best & Belcher nothing is reported to change in any essential the order of the weekly letters received for several months past. In Con. Virginia work is being prosecuted on several levels. It will probably take another assessment to cause them to find ore and also make lower prices for the shares, if that is the intention. In Ophir and Mexican nothing of importance is reported. The work that is being done is of the same character as has heretofore been reported by the superintendents. In Union the work under way promises good results. It seems to be laying the foundation for more active work later on. From Sierra Nevada nothing out of the usual order is reported.

On the Brunswick lode the work that is being done in Occidental is closely watched, but so far that is about all the good it has done anyone. There are persons who have great faith in something of importance being found. The work in that part of the lode around by the middle mines is being pushed as fast as circumstances will admit. There are those who still hold to the opinion that quite a body of ore will be struck, but considerable more work will have to be done yet.

From the Bodie district there is absolutely nothing new to report. The story of distances is still the order. They will have to work on a much lower level before they can expect to find much ore in Bodie. This and the Mono mine are very economically managed.

The following is the usual monthly statement of moneys on hand:

| | | | |
|---|---|---|---|
| BODIE MINES. | | Crown Point | $ 694 |
| Bodie | $ 9,246 | Exchequer | 3,865 |
| Bulwer | 1,763 | E. Sierra Nev | 27 |
| Mono | 920 | Gould & Curry | 6 088 |
| Standard | 21,906 | Hale & Norc'ss | 3,955 |

# Assessment Notices.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 30th day of January, 1896, an assessment (No. 42), of 15 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, No. 22 Nevada Block, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of March, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 28th day of March, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

JNO. W. TWIGGS, Secretary.

Office—No. 22 Nevada Block, San Francisco, California.

JUSTICE MINING COMPANY. — Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of January, 1896, an assessment (No. 60) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 309 Montgomery street, Room 23, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of February, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 9th day of March, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. E. KELLY, Secretary.

Office—No. 309 Montgomery street, Room 23, San Francisco, California.

ALTA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Gold Hill Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of January, 1896, an assessment (No. 51) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 33, Nevada Block, No 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of February, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 9th day of March, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. E. JACOBUS, Secretary.

Office—Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

## DELINQUENT SALE NOTICE.

ANCHOR COAL AND DEVELOPMENT COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Kelso, Cowlitz county, Washington.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 6) levied on the 2d day of January, 1896, the several amounts set opposite the names of the respective shareholders as follows:

| Names. | No. Cert. | No. Shares. | Amt. |
|---|---|---|---|
| B. E. Loomis | 845 | 5 | $ 5 |
| J. A. Christian | 155 | 500 | 15 00 |

# THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it send for catalogue and price list of **standard Mining Works and Scientific Publications.**

**MINING AND SCIENTIFIC PRESS,**
**220 Market Street ..... San Francisco, Cal.**

*Assaying.—Part I—Gold and Silver Ores.*
Second edition. By C. H. Aaron. Embraces 130 12-mo pages with illustrations, well bound in cloth; 1889. Price, postpaid ..... $1 00

*Assaying.—Parts II and III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.*
Latest edition. Contains 163 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid ..... $1 75

*Assayer's Guide.*
By Oscar M. Lieber ..... $1 50

*Assayer's Manual.*
By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. LynWood Garrison. Illustrated. ..... $3 00

*Manual of Assaying—Gold, Silver, Copper and Lead Ores.*
By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 563 pp. Price, postpaid. ..... $2 50

*Notes on Assaying and Assay Schemes.*
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo. cloth ..... $3 00

*Blowpipe Analysis—Manual and Qualitative.*
By F. M. Endlich ..... $4 00

*A Practical Guide for Prospectors, Explorers and Miners*
By C. W. Moore. With numerous illustrations. ..... $1 50

*The Explorer's and Assayers' Companion.*
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid. ..... $6 00

*Aaron's Leaching Gold and Silver Ores.*
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid ..... $3 00

*Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.*
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid. ..... $3 00

*Modern Copper Smelting.*
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated. ..... $5 00

*Cyanide Process.*
By M. Eissler. ..... $3 00

*The Metallurgy of Gold.*
By M. Eissler. Profusely illustrated. ..... $5 00

*Losses in Gold Amalgamation.*
By W. McDermott and P. W. Duffield. ..... $2 00

*Electricity in Mining.*
By Sylvanus P. Thompson. ..... 80 cts.

*Practical Treatise on Hydraulic Mining.*
By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, postpaid. ..... $5 00

*Hydraulic Gold Miner's Manual.*
By T. S. G. Kirkpatrick. With plates and cuts. ..... $2 25

*Manual of Hydraulic Mining for the Use of the Practical Miner.*
By T. E. Van Wagenan. ..... $1 00

*The Coal Mines of the Western Coast of the United States.*
By W. A. Goodyear. 12 mo., cloth. ..... $2 50

*The Sampling and Measurement of Ore Bodies in Mine Examinations.*
Well printed on fine paper, with plates; complete. Price, postpaid. ..... 25 cts.

*Manual of Mining.*
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation, Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth. ..... $4 00

*A Text Book of Mineralogy.*
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth. ..... $3 50

*Manual of Determinative Mineralogy.*
With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth. ..... $3 50

*Practical Hydraulics.*
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid. $2

*Metallurgy of Silver, Gold and Mercury in the United States.*
Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo. ..... $7 50

*Metallurgy of Silver, Gold and Mercury—Continued.*
Vol. II. GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth. ..... $7 50

*Notes on the Treatment of Gold Ores.*
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth. ..... $2 00

*A Practical Manual of Minerals, Mines and Mining.*
By H. S. Osborn. ..... $4 50

*Machinery for Metalliferous Mines.*
By E. Henry Davies. Illustrated. ..... $5 00

*Matte Smelting—Its Principles and Later Developments with an Account of the Pyritic Processes.*
By Herbert Lang. ..... $2 00

*Introduction to the Study of Metallurgy.*
By W. C. Roberts-Austen. ..... $4 00

*Practical Metallurgy and Assaying.*
By A. H. Hiorns. ..... $1 50

*The Practical Metal Worker's Assistant.*
By Oliver Byrne. Illustrated. ..... $5 00

*Mining Machinery.*
By G. G. Andre. Two vols. ..... $15 00

SAVE MONEY BY USING

# THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

**THIS IS WHAT THEY CAN DO:**

**Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines,** using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

| | |
|---|---|
| Coal Gas, ten hours' run, 1000 feet | $2 00 |
| Gasoline (74 deg.), ten hours' run, 8½ gallons @ 14c. | 1 25 |
| Coal Oil, ten hours' run, 7½ gallons @ 10c. | 75 |
| Crude Petroleum, asphaltum base, 16 gallons @ 3c. | 48 |
| Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c. | 65 |

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

## Transporting Mining Machinery.

Residents of accessible mining districts where broad or narrow gauge railways or roads or trails of easy grade make possible the speedy transportation of mining machinery and supplies have little idea of the makesbifts, the efforts and the ingenuity often necessary to pack in everything required in and about a mine situated in some place hard to reach. Many a mill has been put up, many a steam-hoisting works erected where every timber and piece of machinery had to be dragged up steep mountain sides or brought in on the backs of burros. Even yet there are many isolated localities where as much difficulty is found in bringing in required appliances as was experienced in the early days of mining on this coast when the transportation often cost as much as the supplies. But with the settling up of the country and improved mining appliances, much of the former difficulty in this respect has vanished. No part of the mining region of the coast has been exempt from vexatious expense, loss and delay. Whether in the Sierras, or among the crags of Nevada, in Death Valley or the canyons of the rivers, the same difficulty has been encountered. It used to be said in Arizona and Nevada that "the north was the country to mine in; in Montana, Oregon and Idaho they had plenty grass, wood and water, and one could make a road," which was measurably so. But even in the land of "grass, wood and water" were and are problems to be solved in the transportation of mining machinery.

TRANSPORTING AN 800-LB. CAM SHAFT THROUGH A TIMBERED COUNTRY TO AN OREGON GOLD MINE.

From the Hammond Manufacturing Co. of Portland, Oregon, are received four large photographs showing the difficulty of such transportation where too heavy a vegetable growth was as much a detriment to travel as the bold mountain slopes and steep sided canyons of the southern country. One of those pictures shows the method of transporting 6000 feet of three-fourths inch wire rope in one piece over a mountain trail eight and one-half miles, requiring nineteen horses, another the way in which a mortar weighing 6000 pounds was carried over the same trail. This mortar was placed on a "traction sled" consisting of two runners with a pulley on each end of each runner, the mortar bolted to the runner forming the body of the sled. Passing over the pulley was an endless chain with cast-iron traction shoes fastened on it every six inches. On the inner side of this chain between it and the runner were wrought-iron plates turned up at the end sufficient to prevent runners from sliding sidewise as the chain revolved. On the bottom of the runner was fastened a steel shoe. The plates between chain and runner were kept well greased, forming a slippery surface for the runner to slide on, and which revolved as the sled advanced, thereby laying down its own track. Four horses hitched tandem hauled this load, and the sled would climb over logs a foot or more in diameter. Turns were made by a tongue sticking out behind and used as a steering apparatus.

Another of the series of photographs illustrates the transportation of a cam shaft pulley seven feet in diameter and weighing 800 pounds. This latter has been selected as worthy the efforts of our engravers to correctly portray on a copper plate transportation of mining machinery through a mountainous, wooded country. Incidentally, the engraving gives a good idea of Oregon scenery, the tall spruce and hemlock trees being characteristic of that region.

The Champion mine, whither the machinery mentioned is being taken, is in Lane Co., Oregon, forty miles from Cottage Grove. The ore is free milling and concentrating. Supt. Jennings says he has a wire-rope tramway 3100 feet long, connecting the mill and mine. He uses an "Australian" concentrator. The Hammond Manufacturing Co., Portland, Or., have furnished two self-contained five-stamp batteries, and the mill and mine are a present source of profit to the owners.

---

UTAH, the newest of all the States, has a zealous and well meaning legislature in session which seems honestly desirous to do a good deal for the Utah miner. Considerable is now being put through for the protection of the miner, regulation of mining operations, liability for accidents, appointment of State officers, etc. The intent is evidently beneficial, but there seems a probablity that the new commonwealth of Deseret may overdo the thing. With power always comes responsibility. If Utah proposes to operate the mines within its borders it must share the responsibility of evasion or noncompliance with State law. Zeal and good intent are admirable, but a little discretion is also necessary for satisfactory legislation.

---

RECENTLY Thos. A. Edison said he was tired of electricity and was going into mining. He could easily turn his attention to mining without giving up his interest in electrical progress, for electricity has present intimate connection with mining in all its branches. Just now he is experimenting with Prof. Roentjen's recent "ray discovery" or "new light," and is disposed to begin where others leave off. He is testing the value of the x-ray in connection with metallurgy, and gives out probabilities of practical developments in that direction.

---

WITHOUT organizing any million-dollar companies with $25 paid up capital, our sister State to the north is turning out considerable gold in a quiet way. In southern Oregon, over one hundred hydraulic giants are reported in operation in the vicinity of Grant's Pass, and the quartz properties of that region are receiving considerable attention. In Baker Co., in the northeastern part, are some rich gold properties—steady producers that will aid in sending Oregon's gold yield over the $3,000,000 mark in '96.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Transporting an 800-Lb. Cam Shaft Through a Timbered Country to an Oregon Gold Mine, 121. Centrifugal Extractor; Electrical Sinking Pump; Electric Lathe; Electric Drill Press, 127. Chain Blocks, 128.

EDITORIAL.—Transporting Mining Machinery; Zeal of Utah; Edison To Go Into Mining; Oregon Turning Out Considerable Gold, 121. A Communication to the Treasury Department; First Annual Report of the Manufacturers' and Producers' Association; Character and Quality of Advertisers of This Paper; Mr. Ohleyer in the Sacramento "Bee;" Mining Legislation in Congress; "Seeing Through Metal Bars;" Gold Mining in Siskiyou and Trinity Counties, 122.

ELECTRICAL PROGRESS.—Application of Electrical Power; A New Plan To Mount an Electric Motor; Steam and Electricity, 127.

SCIENTIFIC PROGRESS.—Age of the Earth; An Apparatus to Reduce Oxides by the Action of Carbon; World's Fair Medals; Metallic Glucinum, 128.

MECHANICAL PROGRESS.—Some Technical Notes Relating to Chain Blocks, 128. A Visionary Scheme; An Electric Locomotive, 129.

PRACTICAL INFORMATION.—Salt Storm on the Union Pacific Railway; The Internal Temperature of Rocks; Shaving a Man in Twenty five Seconds; The Claim That the Link Between Man and the Ape Has Been Discovered; Nails in Wood; Locks Half a Cent Each; Value of Manufactured Products Greater Than That of Agricultural Products; A Third Wheel for the Bicycle, 129.

MINING SUMMARY.—From the Various Counties of California Nevada and Other Pacific Coast States and Territories, 130-1-2.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 138.

MISCELLANEOUS.—Concentrates, 123. Mines, Miners and Monopolies; Geological Investigation in Michigan; Correspondence Between a Wisconsin Farmer and a Local Boiler Firm; California's Militia Force, 124. Notes on Gold Milling in California, 125. The Aluminum Industry, 126. Dividends Paid by American Mining Companies in 1895, 130. Coast Industrial Notes; Personal; Commercial Paragraphs; Recent Mining Incorporations, 134. Notices of Recent Patents, 135.

THE claim is reiterated that by means of the "X-rays" new light, or recently discovered luminous force, one can "see through metal bars," and attain equally unusual results, such as viewing mineral veins, noting the dip and trend of ore bodies, etc. It is a comforting theory, but so far savors more of the sensational than the scientific.

THE first annual report of the officers of the Manufacturers' and Producers' Association is a clear, business statement of the inception and progress of an important movement in the industrial life of the State. With present and pressing problems, the officers and members have dealt wisely; there are so many interwoven considerations that it is a difficult and delicate matter to do justice to all, but honest and intelligent effort will result in the general good. The first issue of this paper—May 24, 1860—announced in its salutatory the necessity of the development of home industry. Thirty-six years ago that was talked of; at various times efforts have been made to unite in a common cause those most interested. The present association represents so far the most continuous and successful combination through the years, and by every one of the members upbuilding the business principles of the organization success is assured. This is a case where "United we stand; divided we fall."

SISKIYOU AND TRINITY COUNTIES are receiving considerable present deserved attention. There are several undeveloped gold gravel tracts in that part of the State, and the fact that some of our local capitalists allow French and English companies to get in, as they have recently, is not complimentary to their business judgment. Rich as that northwestern part of the State is in these surface gold deposits, it takes capital to develop and work them. In some other parts of California big water ditch supply systems admit of individual working, but in the region referred to nothing extensive has ever been built, and a small claim holder has no chance of getting water enough to work his placer holding. The claims, many of them, are for sale at a very low price, the main cost being in the building of the requisite water system. This the foreign capitalists count on and have the nerve to put up the money. When, later on, they realize the golden returns, no local company can complain that the gold is being carried away. The opportunity has existed for years, and still exists in many cases. The fact that the Klamath, which drains the most of the country referred to, has been officially declared a non-navigable stream removes the debris question, and makes the outlook for hydraulic mining in that section all the more favorable.

THE Treasury Department is in receipt of a letter from E. Polk Johnson, special agent of the Treasury Department at St. Louis, Mo., enclosing a communication addressed to him by the surveyor of customs at Omaha, Neb., recommending that an allowance be made for moisture in lead ores imported by the Omaha & Grant Smelting Co. In reply thereto Acting Secretary Hamlin said: "I invite your attention to the Department's decision of Oct. 5, 1892, (S. 13,391) declining to authorize such allowance in the absence of any provision of law permitting the same, and referring to a decision of the U. S. Supreme Court, October term, 1891, bearing upon the subject. Such ores must be assessed with duty in the condition in which they are imported and cannot be exempted from the operation of a general rule stated in Article 850 of the Customs Regulations of 1892."

WITH justifiable pride this paper refers to the character and quality of its advertisers. There is not a single advertiser in this paper who is not entitled to the confidence of our readers. That is a good deal for a mining paper to say, but it is stated with a full knowledge of all that such a statement implies. Considerable business is weekly declined. Questionable speculations, glittering prospectuses, "bargains" in mining investments, are "conspicuous by their absence" from these columns, and those who use the sacred name of electricity in an attempt to swindle with sundry medicinal "electrical" appliances have long since learned that the MINING AND SCIENTIFIC PRESS declines to lend its aid to such meretricious schemes. Anything that tends to aid or develop legitimate mining or be of service in the field of industrial progress in any department is always worthy of admission herein and is gladly accorded notice. The fact is deemed worthy of note that our thousands of readers can confidently rely on the financial standing and business responsibility of the firms' and individuals whose announcements appear herein.

THE Anti-Debris Association, now the sole opponent of congressional relief to the residents of the Sacramento valley, has a manager, a lawyer and a literary bureau. The manager is a reasonable man, who concedes the fact that one is not necessarily a villain because he does not hold the same views on politics, religion, hydraulic mining, the funding bill and other public topics. The lawyer gets $250 per month as long as active opposition lasts, which is probably sufficient self-justification for his existence. The literary bureau is chiefly represented by Mr. Ohleyer, an earnest, conservative man, who believes all he is told and has a ready pen and abundant leisure. His most recent brochure is a disclosure in the Sacramento *Bee* (approvingly copied in the horror-stricken columns of sympathizing contemporaries) of the dreadful conditions on Chico creek, in Butte Co., where he recently visited. The editor of this paper believes that he lived a year there for every day Mr. Ohleyer spent there and to anyone acquainted with the facts Mr. O.'s statements and deductions are ludicrous. In common with other portions of our favored commonwealth, Butte had been blessed with a bountiful rain just before Mr. O. favored Chico with his transient presence and Chico creek was "booming." Like other inland water courses, it had overflowed and done some damage. In the dim January twilight Mr. O. noted the flooded banks and in the *Bee* he pours out his sympathetic soul, "hydraulic mining" being the subject of his song. There was and is no "mining mud," nor "destruction of fertile farms by the cruel giant." The method in Mr. O.'s monomania regarding hydraulic mining overshadows his admission of the fact that the natural wash and overflow of a freshet was all he saw in a water course innocent of hydraulic mining. Of course, Mr. O. must earn his money as the literary bureau of the Anti-Debris Association, but when that organization sends marked copies of papers containing his effusions to members of Congress in an effort to retard federal legislation that would inure to valley benefit, it would be only fair and honest to stamp the statement at its worth. Further along Mr. Ohleyer also visited Butte creek, which he finds leveed "at enormous expense by innocent yeomanry to restrict the overflow of mining mud." That is rhetorical, and doubtless has cash value with Mr. O.'s supporters; but as a cold fact, Gov. Stanford paid for all that, it being simply a part of the extensive improvements made by that gentleman when he bought the Sam Neal place. Mr. O. goes on and on. To his fertile mind a grain of sand suggests the desert; a mouse's skin the Hudson Bay Co.'s fur trade. Fact is subordinated to fancy and fiction supplies the place of argument or just comment. Seldom are those things noted herein, but Mr. O.'s recent production, a sample of stock on hand, is example of the glamour a good man is liable to when inflamed by passion and inspired by zeal, he nurses a wrath to keep it warm and mistakes the coinage of his brain for the patent facts.

### Mining Legislation in Congress.

The Mineral Land bill recently introduced in the House of Representatives was reported upon favorably by the Committee on Public Lands last Wednesday. It is believed that the bill will pass both houses and become a law. It is the culmination of the fight begun in September, '94, in these columns. Favorable result is not yet certain, and every friend of the miner needs to continue effort in behalf of the measure. The "compromise" bill, so strenuously objected to herein, has been withdrawn; the one now up for passage in Congress is the original bill, as published last in these columns December 21st, 1895, more precisely worded and changed in Sec. 2. In the bill as approved by the California Miners' Association at the convention last November, Sec. 2 reads as follows:

SEC. 2. That, for the purpose of making the examination herein provided for, there shall be appointed by the President of the United States, as soon as practicable after the passage of this act, three Commissioners, each of whom shall be a resident of the State of California, at least one of whom shall be a practical miner, and not more than two of whom shall be appointed from the same political party; and said persons so appointed shall constitute a Board of Commissioners to perform within such State the duties herein prescribed. Before entering upon their duties each of said Commissioners shall take an oath to faithfully perform the duties of his office. The oath of office of said Commissioners shall be filed by them in the office of the Commissioner of the General Land Office. Said Commissioners shall receive for their compensation their actual traveling and other expenses incurred while in the performance of their official duties; and, in addition thereto, the further sum of ten dollars for each day they may be actually engaged in the performance of their duties; and their accounts shall be audited by the Secretary of the Interior and paid monthly. Said Commissioners shall make examination of the lands herein mentioned, and may also take the testimony of witnesses as to the mineral or non-mineral character of any of said lands, and receive any other evidence relating to said matter, and shall have power to summon witnesses to appear before them, and to administer oaths; and they shall, immediately upon their appointment, proceed to examine and classify the lands herein mentioned, within said State of California, as provided in this act. All testimony taken by said Commissioners shall be reduced to writing, subscribed by the witnesses, and filed with the report of the Commissioners hereafter required. The action or decision of a majority of said Commissioners shall control in all matters herein provided for.

The bill reported favorably last Wednesday substitutes the following as Sec. 2:

SEC. 2. That for the purpose of making the examination herein provided for, Commissioners shall be appointed by the President of the United States, as soon as practicable after the passage of this act, as follows, namely: Three Commissioners for the Redding and Susanville land districts, three Commissioners for the Marysville and Sacramento land districts, three Commissioners for the Stockton and San Francisco land districts, and three Commissioners for the Visalia, Independence and Los Angeles land districts. The Commissioners thus appointed shall constitute four separate Boards of Commissioners for the several land districts above named and as last above indicated and set forth. That all of said Commissioners must be residents of said State of California, and at least one of the three Commissioners in each of said Boards of Commissioners must be a practical miner, and not more than two Commissioners in any one Board shall belong to the same political party. Before entering upon their duties each of said Commissioners shall take an oath to faithfully perform the duties of his office. The oath of office of said Commissioners shall be filed by them in the office of the Commissioner of the General Land Office. Said Commissioners shall receive for their compensation their actual traveling and other expenses incurred while in the performance of their official duties; and, in addition thereto, the further sum of ten dollars for each day they may be actually engaged in the performance of their duties; and their accounts shall be audited by the Secretary of the Interior and paid monthly. Said Commissioners shall make examination of the lands herein mentioned within their respective land districts, and may also take the testimony of witnesses as to the mineral or non-mineral character of any of said lands, and receive any other evidence relating to said matter, and shall have power to summon witnesses to appear before them, and to administer oaths; and they shall, immediately upon their appointment, proceed to examine and classify the lands herein mentioned, within their respective land districts, as provided in this act. All testimony taken by said Commissioners shall be reduced to writing, subscribed by the witnesses, and filed with the report of the Commissioners hereinafter required. The action or decision of a majority of any one of said Boards of Commissioners shall control in all matters herein provided for within the jurisdiction of such Board.

This is an improvement; and while it involves a little more governmental expense, it is justified by the importance of the interests involved. Three Commissioners for the whole State would make slow work in comparison with the proposed subdivision of the classification among twelve Commissioners. The fact that, as before, the act provides that the Commissioners shall be appointed by the President of the United States takes the important matter of appointment out of the domain of undue influence. All the miners ask is the appointment of competent, impartial men.

## Concentrates.

DE LAMAR, NEV., has a present population of 1500.

THE Bullion-Beck of Utah will pay a dividend of $25,000 this month.

MERCUR, Utah, $4 ore is mined and milled at a profit of $2 per ton.

THE London *Mining World* says "the real Transvaal question is the want of labor."

NEXT month the owners of the O. K. mine at Trail Creek, B. C., propose to put in a 20-stamp mill.

SEVENTEEN MEN are now employed at the Gladstone mine, French Gulch, Shasta Co., on good pay ore.

DURING '95 the Columbus and Rhodes marshes, Esmeralda Co., Nevada, produced 13,483,380 pounds of borax.

AT Mullan, Idaho, the Hunter mine is again running, with about eighty men, making 200 now employed there.

D. M. STEEN is about to put in a ten-stamp custom mill at Boise, Idaho, and will charge $3.50 per ton for crushing.

A STRIKE of $100 ore is reported in the Morning Star mine at Silver City, Idaho. A mill is to be erected upon the property.

THE *Prospect* hears that the Starlight mine near El Dorado is soon to be started up under the management of G. McM. Ross.

DENVER men have bonded from Hays & Fletcher the Cedar mine, Grass Valley, Cal. It is locally stated that a mill will shortly be built.

THE total lead production on the Pacific coast in 1895 is estimated at 173,000,000 pounds. Three cents was the average price during the year.

A BILL has been introduced in both houses of Congress extending the mineral land laws of the United States to all Indian reservations therein.

THE new ten-stamp mill at the Persia mine, on Saxon's creek, six miles north of Mariposa, Cal., started up this week. W. H. Wright is superintendent.

WHAT a boon it would be to mining communities, says a Utah exchange, could the Grim Reaper transfer his attention from the shining mark to the mining shark.

THE Big Canyon mine, near Placerville, has now assumed sufficient importance to justify the formation of a new school district for the children of the mine employees.

SIX TRAINS a day loaded with men arrive at Cripple Creek, Colorado. Eight out of every ten of these men are residents of Colorado. The other two are from the East.

SUPT. BROWN has forty men working at the Waldo, Oregon, copper mine. Work at the Wheeler City mine has been suspended till damage by recent high water is repaired.

A MINING CONVENTION will be held at Helena, Mont., March 10th, "to promote the legitimate development of the gold, silver, copper, lead, coal and iron resources of the State."

FROM $50,000 to $80,000 is the monthly gold yield of the Kennedy mine, at Jackson, Amador Co., Cal. The ore averages $15; the workings have attained a depth of 2000 feet.

THE U. S. Debris Commission has temporarily closed the Central Hill hydraulic mine at Murphy's, Calaveras Co., for non-compliance with some of the technical requirements.

VICTOR, COLORADO, is announced to be the highest incorporated town in the world, being 10,300 feet above the level of the sea. Leadville is 10,080 and Cripple Creek is about 10,000 feet.

SUPT. BABCOCK of the Golden Scepter Mining Co. proposes to erect a 100-stamp mill at Haney Creek, Montana. It is under consideration to build an electric railway from the mine to the mill.

BIG STORIES blow down from the Pen d'Orelle country of miners making $200 a day with a rocker. Some one may have struck a rich pocket, but the event does not justify more than passing notice.

"No mine can lay claim to real greatness unless it has been held up in court by some pirate with an attenuated claim to an interest in the property," is the correct conclusion of the *Mining Review*.

IN 1892 the silver production of this country amounted to 65,000,000 ounces. In 1891 it dropped to 49,500,000 ounces. At this rate of decrease the production in 1896 will be less than 25,000,000 ounces.

WHITE PINE, Nev., is again heard from; the Chainman has uncovered a large body of ore which is locally represented as being 60 per cent free, the remaining lead sulphides averaging $30 per ton.

IT is reported from Bangor, Butte Co., Cal., that the Catskill mine has been sold to a company composed partly of the owners of the worked-out Derbec mine near North Bloomfield, Nevada county.

IT is calculated that eighteen cubic feet of gravel in bank or twenty-seven cubic feet dry weighs a ton. Thirteen cubic feet of average gold or silver ore in mine, or twenty cubic feet of broken quartz, weighs a ton.

FORTY-THREE sticks of giant powder recently became ignited in the Mollie Gibson mine at Aspen, Colorado, and burned entirely to ashes without an explosion. Had the stuff exploded the loss of life would have been appalling.

A GOOD ILLUSTRATION of how the mining interests of the State are waking up is the increased stir in the newspaper world. Placerville, El Dorado Co., which has been well served by two weeklies, is now to have a daily.

THE Westralian gold output for '95 was 232,591 ozs., valued at $4,397,390. The railway is now thirty-eight miles from Coolgardie. The Government will spend $500,000 to provide water at different centers in the Coolgardie district.

THE Carson, Nevada, mint will no longer be maintained, but will be converted into an assay office, on the same basis as the one at Helena, Montana. It was first opened in 1872. No coining has been done there for nearly three years.

ACTING SECRETARY OF THE TREASURY SCOTT WIKE has made a recommendation for a change in the mining laws so as to allow the Government to defray expenses of refining and parting of bullion at the mints from the sale of the by-products of such bullion.

AT the Broken Hill Proprietary, Australia, for the week ending Jan. 16th, 6679 tons of ore were treated, yielding 449 tons of lead, containing 140,674 ounces silver, also 819 tons treated by amalgamating and leaching plants, producing 9054 ounces silver.

SECRETARY OF THE TREASURY CARLISLE writes: "There is not a word of truth in the statement that the owners of gold mines at Cripple Creek, or any other place, have offered to give the Government gold bullion in exchange for silver dollars, or for any other kind of currency."

AN appeal to the Supreme Court of Oregon is being perfected in the case of Francis Clarno, assignee of the Portland Mining Co., vs. George W. Grayson of this city. The case involves the title to the Virtue mine, near Baker City, Or., and $50,000 damages. An appeal bond has been filed.

THE *Mail* has ceased publishing lists of the newly organized Cripple Creek gold mining incorporations. Its brief and breezy editorial explanation is "it takes up too much valuable space. More than half these companies are frauds, anyway, which deserve no public notice other than exposure."

"CONCENTRATES" is told that the January gold yield of the Utica mine, Calaveras county, was a little over $800,000. My, what a fuss would be made about a mine with such a yield anywhere else on earth! Here in California it is taken as a matter of course—same as the big trees, the violets and strawberries in February, etc.

THE Mountain Mines Co. of Keswick, Shasta Co., expects to shortly begin monthly shipments of several thousand tons of copper matte twelve miles over its newly constructed road, thence to this city on the S. P. at 45 cents per ton, thence to Swansea for refinement. The first smelter is about finished. There will be four in all.

THE Godbe Mining Co. of Salt Lake and Denver has assumed control of the Machu mine, West Point, Calaveras Co., it having a bond on the mine. A shaft is sunk ninety feet and two levels 100 feet have been run southerly, a paying ledge being found in each case. It is locally reported that the Godbe Co. will build a stamp mill and hoisting works.

EMPEROR WILLIAM of Germany's cablegram to a Montreal firm asking could they supply him with 200 tons nickel has occasioned great interest. Sudbury, Ontario, has the largest known nickel deposits. Last year that district produced 4,566,542 lbs. Of this, 3,138,400 lbs. was imported into this country; the remainder went to Europe.

ONE HUNDRED business men of Leadville, Colorado, have entered into an agreement to pay $10 per month each for the purpose of developing prospects, and similar movements are being started in other Colorado towns. The purpose is to give employment to the idle miners and open up undeveloped properties, some of which are certain to become producing mines.

"A SUBSCRIBER" writes from Park City, Utah: "What is the deepest perpendicular shaft in the United States?" The vertical shaft at the Calumet & Hecla copper mine, Calumet, Mich., is now 4880 feet deep. At 20 feet deeper work will be stopped and cross-cutting and drifting will begin. The shaft is over 1000 feet deeper than any outside of Calumet, and is believed to be the deepest in the world.

STATE DEBRIS COMMISSIONER JOHN F. KIDDER has applied to the Supreme Court for a writ of mandate to compel State Controller Colgan to audit his January salary demand for $300 as a member of the State Debris Commission. Colgan has an opinion from State Attorney Fitzgerald that the money need not be paid. Should the case be brought to a final test it is probable that the opinion of Mr. Fitzgerald's predecessor, that the money may be legally paid, will obtain.

IN '95 the Rand Central Ore Reduction Co., Johannesburg, S. A., made a profit of £40,000 by treating 357,000 tons of tailings, and it is said they have a million tons of tailings left. This company is about to engage in the treatment of the Robinson slimes, which, it is believed, it will be able to do at a profit. These slimes are estimated in quantity at half a million tons, and should the effort to treat them be successful, then the slimes of adjoining companies will be operated upon in the same way.

REGARDING the Golden Sand Placer Mining Co., and its dredging operations in the Sacramento river near the mouth of the American river, a stockholder in the company writes "Concentrates" that there is but one amalgamator aboard the dredger, and that "the directors of the company are about to set up a clam shell bucket in lieu of the endless chain and buckets in order to be able to dredge in deep water and to a greater depth. When this is done, dredging will be commenced, flood or no flood."

AT the North Pole Mining Co., Cracker district, Baker Co., Or., Superintendent Recknagel proposes to erect an 80-stamp mill. A. Geiser, owner of the Bonanza mine at Clifford, Or., forty miles from Baker City, is in the city buying 10 stamps to add to his 10 stamps now in operation. This mill is turning out 500 ounces gold per month. At the Red Boy mine, Clifford, Taber & Godfrey propose to put in a 10-stamp mill. At the Ajax Superintendent Hartsell has added 10 stamps. The district is turning out considerable gold and times are lively. Men are paid $3 per day.

THE Leadville, Col., *Herald-Democrat*, in speaking of the big drilling match arranged to be held in the Ice Palace, says: "The Miners' Union will have a day at the Ice Palace, and it will be a big one. It is to be Feb. 24th and the great feature of the occasion will be a double-handed drilling contest. The first prize is $600; second, $300; third, $100. Gavin & L'Abbe add another $100 to the first prize, making $700, the largest rock-drilling prize ever contested for. All communications can be addressed to E. J. Dewar, box 132, Leadville." The California Miners' Association held a drilling contest in this city two years ago at which over $1200 was distributed in prizes.

AN ingenious geologist has propounded the astonishing theory that the center of the earth is a mass of molten gold and platinum. He says: "If you put into a bottle some coffee, some sand, and some quicksilver, fill it up with water and then shake it briskly, as soon as it has rested for a minute you will have a layer of quicksilver at the bottom, a layer of sand in the middle and a layer of coffee on top, with the water over all. That is, the heaviest at the bottom and the lightest on top. At one time the earth was just like the contents of the shaken bottle. And as it has cooled it is likely that the heaviest of all the elements—platinum—has gone to the bottom, that is, the center; and that the platinum is surrounded by a layer of pure gold. The gold that we find on the surface is merely a small quantity that, here and there, got entangled with other things and was prevented from sinking." This should afford some additional argument for the "deepest level" mining propositions of our South African friends.

E. P. LEAHY of Anaconda, Montana, is announced as the maker of a new device in placer mining. "It will do away with flumes, ditches and canals and the usual labor of panwashing and rock-rolling usually incident to placer mines. The outfit in question is a pumping engine ranging from 1 to 250-horse power and runs without steam, water, fire or electricity. This engine can be had to force water up a pipe 1000 feet with a very strong pressure. Where there is water in the vicinity of the mines he guarantees to supply it for placer mining purposes with this pumping engine at one-third the actual cost of constructing an ordinary steam-pumping outfit." The *New Northwest* says it is a sure success, and that "there are to-day over 45,000 in actual use." This may be so, but 45,000 such machines "in actual use," running "without steam, water, fire or electricity," seems a good many. "Concentrates" confesses its inability to locate one of that number.

THIS is how the current issue of the London *Mining World* talks of the Randt, South Africa, district: "At a time of depression like the present, it may be useful to recall what the Randt has done. Its mines have produced since 1887, when the first crushings took place, 8,800,000 ozs., valued at £30,800,000. The annual average production for the last two years may be taken roughly at over 2,000,000 ozs., valued at nearly £8,000,000, but this is nothing to what will take place, if we are allowed to work in peace and under normal conditions, in the near future. Already, we may expect an increase of the stamping power by 2265 stamps, and this is not including the 100 stamps apiece which it is believed the Crown, Langlaagte, Jumpers, Robinson, Nourse and Rose Deeps will shortly erect, which will add 600 more. All these stamps are of the heavier pattern, capable of crushing four and one-half tons a day; in fact, all anticipations lead to the belief that in five or six years' time 7000 to 8000 stamps should be crushing 1,000,000 tons a month, producing 400,000 to 500,000 ozs., or 5,000,000 to 6,000,000 ozs. per annum, and having a value of between £17,500,000 and £20,000,000 per annum."

IT is a curious commentary upon the instability of human affairs that the former owner of the entire city of Johannesburg now lies a confirmed invalid in the workhouse infirmary of the quaint old market town of Guildford, in Surrey, England. The old man seems to have had a most remarkable career. He was in the service of the East India Company, fought in the Crimea, was seriously wounded at Sebastopol, and afterward passed through the Indian mutiny. He then went to South Africa, where he fought against the Zulus and the Boers before the Transvaal was made over to them. He bought for £350—his accumulated savings—over 15,000 acres of land near the source of the Limpopo, where he made up his mind to ultimately settle, but war broke out, he took up arms against the Boers, and formed one of the party who held Pretoria against them. In 1880, when the Republic was declared, he refused service under President Kruger, and the consequence was that his land, upon a portion of which the Transvaal city of Johannesburg now stands, was forfeited. Thus the old man who lies dying without a penny in the world just escaped being "rich beyond the dreams of avarice."

AT Spokane, Wash., last Monday, Judge McBride found for the plaintiff in the suit of C. P. Oudin vs. Chas. Crossman. Crossman sold to Oudin a one-fourth interest in the Monitor, a British Columbia mine, for $1000 cash. The purchase was made solely upon the representations of Crossman, that the lode was a large one, carrying gold, and would assay from $15 to the ton upward. Crossman went to the property with Adolph Hellmers. Samples were taken from the lode and brought to Spokane in a sack for assay. Without the knowledge of Hellmers the samples, after being taken from the lode and before being assayed, were artificially charged with free gold, so that the assay when made showed a very large value for the ores. Crossman, well knowing that the samples did not represent the true value of the ore in the location, and knowing that the plaintiff was being deceived, induced him to make the purchase. The contract was the result of the deception, Crossman knowing that the property sold was worthless. The court's conclusions were that the contract of the purchase be rescinded and annulled, the defendants entitled to a reconveyance of the property sold to the plaintiff, and the plaintiff is entitled to the judgment for $1000, with interest and costs of suit.

DISCOURSING of the dykes and ore deposits of Cripple Creek, Colorado, State Geologist Rickard says: "One of the characteristic types of ore occurrence is that of gold-bearing dykes traversing the breccia and penetrating into the granite. Several well-known lodes are essentially such dykes usually marked by a multiple fissuring which produces a certain sheeting of the rock along planes enriched by the presence of gold-bearing ore. The ore is apt to have one fracture plane, and travel in a broken way across the formation to assume a more regular behavior as soon as it reaches a neighboring parallel 'wall.' The original wall goes on, smooth as a skating rink, devoid of ore and delusive as a promoter's dream, while the ore, obedient to the structure of the enclosing rock, scatters itself amid small cross seams, which finally lead to a companion fracture parallel to the original ore channel. In such a formation, crosscutting, based on a careful study of the structural geology, is imperatively necessary. It will be found as development proceeds that the ore deposition is intimately associated with multiplicity of subfracturing, quite opposed to that ideal conception of the fissure vein, which has led many to think of it as having the regularity of a sheet of paper, and penetrating creation with a careless disregard of the structure of the enclosing rock. Some of the ore discoveries are destined to be very restricted in size: other depositions of gold are evidently favored with an environment which makes it geologically probable that they will be marked by a continuity of productiveness. The district is already so large, twenty square miles at least, and the formation is so varied that many mistakes will be made by applying the experience obtained in one part of the camp to another portion, which has a geological structure quite dissimilar. To quote the rich ore reserves of a well-known mine as indicative of the potential richness of a neighboring claim is likely to be more than usually misleading, because the former is apt to have a rock formation entirely unlike that existing in the latter. For these reasons Cripple Creek will afford good opportunity for the proper use of the technical training of the experienced mining engineer."

## Mines, Miners and Monopolies.

Written by J. A. EDMAN.

NUMBER V.

Returning to the industrial history of mining in California, and reviewing the period between 1880 and 1890, we find that the Southern Pacific Company had not been inactive, even if not asserting its claims prominently. It had been busily investigating; and from the records of the general and local land offices, as well as from the reports of its own surveyors and mineral experts, had gained a very thorough knowledge of the topography and mineral resources within its grants, and specially of the areas, both vacant and occupied within the odd sections. So far, neither the people of California nor Oregon had made any organized efforts to oppose the oppression of the monopoly, and to our shame it must be said that individual complaints and remonstrances had shown as little tangible effect in consolidating the miners of California against the common enemy as our representations and appeals had found recognition by Congress. Gradually the company had filed its lists of lands claimed under the grants and had received patents on smaller selections. In doing so, it had frequently come in conflict with mineral claimants both in the courts and in the land offices, and had often been defeated by miners competent and able to defend themselves, while it levied blackmail upon power or less influential men desirous of preserving their property and make good their titles. One of the most flagrant instances on record of this infamous practice occurred in 1890, and is generally known as the case of Francœur versus Newhouse, tried in the Circuit Court of the United States before Judge Sawyer, August 9, 1890, and relates to the title of the Eagle Bird mine in Nevada county. Although well known in California, the case is so typical of the spirit and tactics of the Southern Pacific Company that a brief statement may here be in place. According to the testimony, the land in controversy had been occupied and worked as a quartz mine for over twenty-eight years, had had improvements of great value placed upon it, and was held under a U. S. patent for five years preceding the filing of the complaint. During all that period the railroad company had not set up any adverse title. In spite of all this the railroad corporation claiming title under the grant to the C. P. Company conveyed by deed the property in question to the plaintiff who brought suit, which, after a long contested trial, resulted in judgment for the defendant on all points and a signal defeat to the company and its subservient tools. In this case, however, the property was of great value and the owners able to defend themselves. A different result might have been expected under different conditions of ownership*. With the prospect before him of having to defend his title in the courts, is it a wonder that the miner or investor prefers other and safer fields for his labor and his capital ?

After this long period of apathy and inactivity by the struggling miners of California, a change for the better was inaugurated by a handful of men chiefly interested in hydraulic mining, whose properties had remained dormant and unproductive for years, and its first fruit was the organization of the California Miners' Association, whose delegates held their first convention in San Francisco on January 20, 1892, and discussed the general good of the industry and means for the rehabilitation of hydraulic mining with proper restrictions under the laws. As resulting from this action, the so-called Caminetti bill was introduced in the House of Representatives early in February, 1892, and passed there, but was not acted upon in the Senate.

The second convention of the Miners' Association was held in San Francisco, Nov. 15, 1892, and questions of general interest were discussed, among them the resumption of hydraulic mining. A memorial was prepared for presentation to Congress and resolutions passed setting forth the absorption of mineral land by the railroad company and praying for a remedy. The Association at that time counted 4378 members.

The Caminetti bill finally passed March 3, 1893, and in May the President appointed the Debris Commissioners, who shortly after organized and made ready for their labors under the Act. The State Legislature also passed a bill appointing a State Debris Commissioner.

The third convention of the Association, held October 9, 1893, entered a still wider field of discussion, among which the unfair rulings of the Interior Department became prominent. Resolutions were adopted and amendments proposed to the mining statutes, chiefly in relation to mineral land and determination of its character.

At the fourth convention, held November 19, 1894, delegates were present from Montana, Idaho, Utah, Alaska and Washington Territories, and the convention was addressed by many prominent men of the State, among them several of California's Congressmen. Representative Caminetti spoke there, as follows:

"Now, while you people are waiting, while the people throughout the district are doing nothing, the Southern Pacific Railroad, by its army of officers, by its army of perjured witnesses, is going round the district and in the land offices in this State and in Washington, robbing from the people of this State and from the miners the land that belongs to them."

He also said: "Under this departmental law, against the spirit of our laws, against the spirit of the mining laws, it has been intended to give this corporation lands that do not belong to them—lands that by the decision of the Supreme Court of the United States are plainly said to belong to the people, and any attempt to wrest it from the people by the means they have resorted to is illegal and a fraud."

At this convention a Committee on the Protection of Mineral Land was appointed and was instructed to take action to protect the mineral lands from absorbtion by the railroad company. When this committee went to work and sent an agent to Washington, he was denied the privilege of examining the records in the General Land Office of the selections of land made by the railroad, and it was only after a strong protest by the chairman of the Mineral Land Committee to the Secretary of the Interior that he was given access to them.

Through the action of the Mineral Land Committee protests were entered against the issuance of patents to large portions of the lands claimed by the Southern Pacific Company, and action thereon was temporarily suspended.

In April, 1895, chairman of the Mineral Land Committee, proceeded to Washington and laid the miners' case before the President as well as the Secretary of the Interior and the Commissioner of the General Land Office, and endeavored to secure a suspension of all proceedings in patenting public lands within railroad grant limits in California till Congress would meet in December and could take action on the classification bill (substantially the Idaho-Montana bill) introduced during the closing weeks of the Fifty-third Congress.

To his representations, supported by briefs and evidence, he received but evasive assurances, and shortly after his return to California the Commissioner dismissed the protests, when the matter was appealed to the Secretary of the Interior who speedily (November 5, 1895,) approved the dismissal—a conclusive evidence of the alliance of Interior Department with the railroad power and its total indifference to the rights of the Government as well as to the people's cause.

During last June the Legislative Committee of the Miners' Association had prepared two bills for introduction in Congress, one recommending amendments to the Mining Statutes, another providing for an appropriation to be expended by the Debris Commission in the construction of restraining dams.

The foregoing review represents the origin and prominent acts of the California Miners' Association up to July 1, 1895, to which time its action had been harmonious and mainly directed to the common good of the mining industry, and by its official acts the Association had gained the firm support and lasting gratitude of the great majority of all the miners in the State.†

While the miners of California had been thus occupied, it must not be supposed that the railroad interest had slumbered or had acquired any unusual access of justice, honor or patriotism. The Southern Pacific Company was preparing for its great stroke of policy, but its field of activity was mainly in the East and was concerned with the executive and legislative powers of the Government. Fully conversant with political tactics and intrigues; subtle and secretive as befits such a cause; in possession of a large contingent fund and familiar with its most effective use when convincing arguments were to be applied; supported by an army of dependents and lobbyists, the campaign had been mapped out by the able if unscrupulous mind which so long has directed the destinies of the Southern Pacific. With that company it was not now a-striving for supremacy on the Pacific coast; it was a fight almost for its existence. The obligations of the Central Pacific due the Government and exceeding eighty million dollars were to be met in 1896, and without any disposition to disgorge their booty the magnates and managers of the company proposed to coax, cajole, flatter or frighten the Government to reduce its large and just claims to the nominal pittance offered by the company, and thereby to perpetuate or prolong its existence for an indefinite term.

During the period from 1890 to 1895 the persistence in this policy had borne fruit and the departments in Washington had become stanch friends of, and in the case of the Interior Department, entirely subservient to the railroad power. The climax was reached when the odiously celebrated rules of July, 1894, were issued by the Secretary of the Interior, as before stated. Before this date comparatively few selections of land within the mineral belts had been filed at the General Land Office, but after the road had been opened for unobstructed perjury, the lists of selections were filed in rapid succession as distinctively mineral lands, not only in the main gold belt, but largely in the northern and southern belts. On July 1, 1894, there had been patented to the Southern Pacific Company within the Central Pacific grant 491,000 acres, and selections (largely of mineral land) had been approved to the extent of 415,000 acres more, leaving only 732,000 acres not located, chiefly because unsurveyed.

Before October, 1895, by which time the Miners' Association had become fully conversant with the methods of the company, over 600,000 acres of mineral land had been filed upon by the Southern Pacific Company; protests had been entered by the Miners' Association and had been dismissed by the commissioner; appeals had been taken to the Secretary of the Interior and had by him been dismissed and the lists approved for patenting, all before Nov. 5, 1895—a rapidity of action showing the perfection and smoothness of motion of official machinery when properly lubricated. Among the lists thus approved Clear List No. 54 will ever be evidence of misrule, robbery and official corruption, as it embraces old and well known mines and townsites, close to the Central Pacific railroad, returned by United States surveyors as mineral and as such specially described by the geological surveys of the United States and of the State of California.

It was during this period of activity in the General Land Office that the Southern Pacific Company had introduced its scheme of a Funding bill in the Fifty-third Congress, and, thanks to the initiative and activity of the liberty-loving citizens of San Francisco, and the able support of our then representatives in Congress, had there been ignominiously defeated, only to present the same scheme with some new features before the present Congress.

Meadow Valley, Cal., Feb. 5, 1896.

(*To be Continued.*)

*The above case is given in full on page 930 of the tenth annual report of the State Mineralogist, to which the reader is referred for details of this important case.

NOTE.—In No. 2 of this series, page 64, last line of first paragraph, second column, for J. S. Dreer read J. S. Diller.

† A full and comprehensive history of the Miners' Association can be found in No. 15. Vol. LXXI of the MINING AND SCIENTIFIC PRESS, to which the reader is referred.

## Geological Investigation in Michigan.

TO THE EDITOR:—It is the intention of State Geologists Messrs. Hubbard and Lane to devote a great deal of their time this spring to a thorough investigation of the geological formations of the Lake Superior native copper range in Keweenaw county. In addition to the geologists' labor, it is the plan of some prominent mining men who are interested in this county to further explore and develop their mining properties.

It is in this county that the celebrated mass copper-producing mines—the Cliff, Phœnix, Central and Copper Falls—are, which are worked almost exclusively on what are known as the fissure veins. It is now just half a century since the first of these mines was discovered, and a quarter of a century ago since they were most productive. To-day only one mine, the Central, is being worked and that only with a very small force, producing about twenty-two tons of copper per month.

The master belts or veins that are being worked so successfully in Houghton county, known as the Calumet conglomerate, Osceola, Amygdaloid, and Quincy or Pewabic veins, are known to extend through Keweenaw county, and the thorough exploration that modern methods of mining are now capable of doing will undoubtedly, when guided by scientific information, reveal that which will make this almost abandoned mining territory a rich copper and silver-producing district again.

In addition to its copper veins, there are known to exist veins that will pay to work for native silver alone.

Over fifty years ago Captain "Dick Kernic," a practical Cornish miner, found a rich conglomerate vein between Calumet and the Cliff location; he was unable to pay the miners who worked under him, so he went East and got money from some capitalist and was then known to have got north of Green Bay, Wis., where all track of him was lost. He is supposed to have been murdered for his money, as his wife in Cornwall or his friends on Lake Superior never got any clue of him. His rich copper discovery has not since been found, unless his was the original Calumet vein. A. F. ISLER.

Houghton, Mich., Feb. 7, 1896.

THE Syracuse, New York, *Standard* tells of an amusing correspondence that recently took place between a Wisconsin farmer and a local boiler firm. The farmer wrote as follows: "Dere Sirs I hav a 1000 akers of trees that I want cut. Im pore but Im willing to pay too hundred dollers fer an engin that will do my work," and he went on to explain just what sort of an engine he wanted. The boiler firm saw that the engine necessary to accomplish the devastation of his virginal forest would cost $3000, and they informed him to this effect. A week passed and then the following pithy epistle came from the Wisconsin woods: "Dere Sirs what in h—l wud I want of an engin or biler if I hed $3000 ?."

CALIFORNIA'S present militia force is officially stated to be: Commissioned officers, 304; enlisted men, 3986; total, 4290. The total available men for military duty in California is figured at 203,523.

## Notes on Gold Milling in California.

NUMBER XIII.

By E. B PRESTON, M. E., Field Assistant State Mining Bureau.*

No. 4. *Calaveras County.*—The rock consists of massive quartz, schistose and slaty diabase, and chloritic and talcose schist, with iron sulphurets; it is crushed in jaw-breakers at the head of the shaft, after passing over grizzlies, and is dropped into bins, from which the ore is conveyed, in cars, to three other bins in the mill, one for each section of twenty stamps, having a capacity of 600 tons each. The bins discharge into Challenge self-feeders. The sixty stamps weigh 775 lbs. each, and drop 105 times per minute, the drop being 6 inches, and the discharge 10 inches from the new die. Only one chock-block is used, causing the height of discharge to constantly increase. The duty of the stamps is 4 tons in twenty-four hours. Round-punched tin screens, 10x14 inches, are used. They are lightly burned before using. Three and a half of the screen sheets are tacked on the screen-frame on three sides; the top side is secured by a long, narrow strip of wood screwed to the frame. The superficial area of the discharge is about 287 sq. in. The screen-frame is braced by six cross-ribs, to which the screens are tacked. A splash-board is suspended in front of the screen by eyebolts and hooks, with a strip of canvas tacked along the bottom, the full width of the screen. An iron apron or table is secured to the front of the mortar below the screen, the bottom of which falls 1 inch below the lip of the mortar; permitting the insertion of a rough inch board, 9 inches in width, in front of the mortar, flush with the upper edge of the mortar; on this the pulp falls from the screen, and it is claimed to be superior to a plate in retaining the amalgam. Three inches below the board runs a trough, in which are two apertures one-third the distance from each end, which allows the pulp to fall on a short, 6-inch wide copper plate with a pitch toward the mortar, and from thence to the apron-plate, 2 inches wide and 24 inches long, set to a grade of 2 inches to the foot. An inside front plate is used in the mortar. From the apron-plate the pulp passes to a sluice-box and is conducted to the spreaders of the vanners, of which there are twenty-four. After leaving these, the pulp is led through a sluice-box and flume one mile long to the canvas-plant. The plates are dressed every morning; a battery is hung up, the water shut off, the splash-board removed and washed off, as also the screen and the entire front of the battery, to remove all sand; the plate is then vigorously scoured with a whisk-broom to loosen the amalgam. A very dilute solution of cyanide of potassium is sometimes used during this operation, and the lossened amalgam brushed to the foot of the plate. The plate is then scraped upwards with a piece of rubber 4x4 inches and ½ inch thick; a piece of rubber belting would answer the same purpose. The collected amalgam at the head of the plate is removed in a scoop and placed in a safe. The plate is then sprinkled lightly with quicksilver, which is spread evenly over the entire plate, the water turned on, and the stamps dropped. The operation for all the plates requires nearly three hours.

A clean-up of the mill is made monthly or semi-monthly, according to the condition of the battery amalgam, at which time all necessary repairs are made, and new shoes and dies are fixed if required. Shortly before hanging up, the feed is shut off to permit the ore to be crushed down as low as possible. The water is then shut off from the battery, splash-board and screen removed, and all hosed off; the inside plate is removed, and the amalgam scraped off. The contents of the battery are now removed, and placed in the relvolving clean-up barrel, the dies replaced, tappets set, screens replaced, and the mill started. The pulp that leaves the mill carries considerable auriferous pyritical slimes, as might be inferred from the high discharge used in the battery. This is conveyed through a sluice 12x8 inches, to a canvas-plant one mile distant. Just before entering the building set apart for the recovery of these slimes, the sluice is widened to 18 inches, and divided into three sections by two narrow strips fastened to the bottom. These divisions fork off into separate sluices, which are again subdivided. Three of these subdivisions are carried directly through the building, and there divided, and the other three are divided off in five separate sluices, one for each section of the canvas-tables. There are forty-five sections for each table—ninety in all. They are 42 feet long, 22 inches wide, and set on a grade 1¼ inches to the foot. No. 8 duck canvas is used, and when worn on one side it is turned; it lasts about one year. The last division of the pulp, outside the building, is into five boxes, 4 inches square, each of which terminates in a receiving-box, reaching across three canvas sections, about 5½ feet. The five divisions supply one-third of the sluices on one side of the bulding; the pulp passing to the canvas through an auger-hole in the side of the box. The flow is regulated by a slide suspended over the whole. Above the pulp-distributing box is a clear-water box, and at the lower end of the canvas-tables are two sluices, side by side—one to receive the concentrates, the other for the reception and discharge of pulp. The current must be thinned and distributed so that no accumulations form.

No. 5. *El Dorado County.*—The quartz carries considerable slate mixed with it, and about 3% of iron sulphurets. The stamps weigh 950 lbs. each, and drop 4 inches 104 times per minute, discharging through a No. 2 sheet-tin, perforated screen, with from 5 to 7 inches discharge, crushing three tons per stamp in 24 hours. The shoes and dies are both steel. The battery is supplied with an inside plate in front. The apron-plates are 16 inches long, set on a grade of 1¾ inches to the foot, and are followed by 6 inches of sluice-plates, 2 inches wide on the same grade. These plates are dressed every day, but only scraped once a month. (Note:—This is not advantageous, as the constant scouring action of the pulp undoubtedly detaches fine particles of amalgam.) The batteries yield 62% of the amalgam. Eight Woodbury concentrators receive the pulp. The quicksilver is introduced into the battery every half hour; the loss of quicksilver being estimated about one pound to every ten tons of ore.

No. 6. *El Dorado County.*—The quartz carries about 2% of sulphurets and contains slate mixed with it. The stamps weigh 750 lbs. each and are fed by Challenge feeders; no rock-breaker is used. The stamps make 96 drops per minute, varying from 4½ inches to 6 inches, with 7 inches discharge. The mortars are wide, and have an 8-inch wide amalgamated plate; the screen is perforated tin, equal to No. 7. The apron is 54x42 inches, with grade of 1¾ inches to the foot, followed by sluice-plates 12 feet long, which are double on one battery and divided into four divisions on the other; this arrangement gives better results. Below the sluice-plates is a blanket-sluice, 6 feet long and 14 inches wide, the blanket being washed twice a shift. From these the pulp passes to the Frue vanners with 6-foot belts; the same wheel runs both stamps and vanners. The plates are dressed twice in twenty-four hours, but are not scraped until the clean-up, once a month. One and three quarters tons are crushed to the stamp per twenty-four hours.

No. 7. *Mariposa County.*—This mill is working on ores containing gold in a very finely divided state. There are ten stamps of 900 lbs. each, fed by self-feeders. These stamps drop 96 times per minute, with a 7-inch discharge while the die is new; when it is worn down one-half, a smaller chock-block is placed under the screen. The pulp is retained in the mortar for a long time. The stamps are only raised to the level of the water as it stands in the mortar; and a front inside plate is used. The screen is a 60-mesh. It is claimed that 79% of all the amalgam saved is taken from the inside battery-plate. There are three apron-plates to each battery; the first is immediately in front of the splash-board, next to the lip of the mortar, 12 inches deep and the width of the mortar. This is followed by a 2-inch drop onto a second plate 3 feet deep, across the width of the mortar, succeeded by a 1-inch drop to a 4-foot apron-plate. from this plate the mortar, succeeded by a 1-inch drop to a 4-foot apron-plate. From this plate the pulp passes immediately through distributing pipes to the vanners, of which there are three. Two of these are 4 feet wide, taking the pulp from one battery, while a 6-foot belt vanner takes the pulp from the other battery. The narrow belt vanner gives the best satisfaction.

No. 8. *Nevada County.*—The ore is delivered by car at the top of the mill into grizzlies, the bars of which are 2½ inches apart, and which deliver the coarse stuff to a crusher of the Blake type, through a bin with chute immediately over the crusher, keeping the same constantly supplied without the aid of a shovel. From the rock-breaker the ore is delivered into bins with chutes connecting with the Challenge self-feeders. The feed is operated from the center stamp. The stamps drop 7 inches and 86 times per minute, with a 4-inch discharge. Steel shoes on iron dies are used. The screens are English sheet tin, perforated, No. 10, five pieces making a complete screen, costing 50 cents, and lasting one month. The steel shoes on iron dies have records of over 300 tons to the stamp, the daily average being from 1¾ to 2 tons per stamp. The plates are divided into an upper apron, 18 inches wide, followed by a 4-foot apron. Between the two, catching the pulp from No. 1, is a box 3 inches wide, with a perforated screen bottom, somewhat coarser than the battery screen. This acts as a distributor on No. 2 apron, retaining any coarse pieces. For the forty stamps and accompanying concentrators, 15 miner's inches of water are used, all applied on the inside of the battery. The aprons have a ⅝-inch grade to the foot. Below the apron are 12 feet of sluice-plates, part of them 30 inches wide, while the others have the same width as the apron above. These plates are cleaned up every morning with pieces of rubber belting; it takes about fifteen minutes to clean one set. From the sluice-plates the pulp passes over a 12-foot shaking table covered with silver plates; these plates receive their motion from an eccentric placed underneath. Passing the table the pulp enters a box, from which it is conveyed through pipes to the vanners on a lower floor, two for each battery.

No. 9. *Nevada County.*—The stamps weigh 750 lbs. each, drop 6 inches, 95 times per minute; with from 4 inches to 6 inches discharge, and crush from 1¾ to 2 tons per day, using stee shoes and dies. There is a 5-inch wide silvered plate in the front of the battery. A No. 9, perforated, sheet-tin screen is used; it is not burnt before putting on, and is turned when the lower edge is worn, lasting on an average thirty days. In front of the screen is a splash-board, provided with an 8-inch plate next to the screen. The upper apron-plate is 18 inches deep, set on a grade of ¾ of an inch to the foot, with 12 feet of apron-plates below, divided into four plates of 3 feet each, set on a grade of 1 inch to the foot. From these the pulp drops into a box running across the end of the plate, from whence it passes to the vanner. The plates are scraped every twenty-four hours, with the exception of the upper 4 inches next the mortar, and are dressed twice a day, using dilute cyanide of potassium. Both rubbers and chisels are used in scraping the plates. In cleaning up the batteries, which occurs once per month, the headings are put into a revolving barrel with pieces of iron and quicksilver, and after running several hours, the contents are removed in buckets, the sand "boiled out" with the hose, the dross skimmed off, and the quicksilver strained. About 75% of the amalgam is saved in the battery. The tailings assay from 25 cts. to $1.50 per ton.

No. 10. *Nevada County.*—The stamps weigh 800 lbs. each, and are given a 6 inch drop, 100 times per minute, with a discharge varying from 2 inches to 4 inches; there are no plates in the battery. The ore passes over grizzlies, with bars 1¼ inches apart, to a No. 2 Blake crusher; thence to the ore-bin that supplies the Challenge feeders, which are operated from the center stamp. Steel shoes and iron dies are used—the shoes lasting, on an average, 155 days; the iron dies, 70 days. No. 6 Russian-iron slot-screens are used. The outside mortar-plate is 14 inches wide, with ½-inch pitch to the foot, and retains 75% of the plate amalgam. The apron below is 4x4 feet, with a grade of ¾ inch to the foot. Beyond this are 12 feet of double sluice-plates 12 inches wide, and with ¾ inch grade to the foot. Three sand-boxes separate the different apron-plates. From the sluice-plates the pulp passes directly to the concentrators. The duty of the stamps is two tons per day. The tailings assay $1.80 to $2 per ton. From 10 to 12 lbs. of quicksilver per month is used for the 40 stamps. The plates are scraped every day, and the batteries cleaned once a month, the headings being worked in a Knox pan. A weak solution of cyanide of potassium is used in dressing the plates.

No. 11. *Placer County.*—The quartz carries but a small percentage of sulphurets, and is delivered from the mine over an incline tramway to two grizzlies with 12 bars, 3 inches apart, 12 feet long, 3 inches deep and ½-inch wide, set on an angle of 45°. In front, below, and between the grizzlies is a Blake crusher, from which the ore drops into the bin that supplies the Challenge feeders. These are operated from the center stamp. The stamps weigh 750 lbs. each, and drop 5 inches, 90 times a minute, and the discharge averages 5 inches. The screen is set on a 4-inch block, with a 5-inch plate on the inside. The screen is a No. 10, slot-punched, set with a slight incline. Part of the water for the battery is supplied from a small wooden trough, pierced with holes in holes in front of the screen. The outside iron lip of the mortar is covered with a silvered plate. The apron, set on a grade of 1½ inches to the foot, is 4 feet long, and is followed by 12 feet of sluice-plates, 18 inches wide. After passing through a quicksilver trap, the pulp passes through a 3-inch pipe to the Frue vanners. A tank of quicksilver is used every three months, in crushing 3500 tons of ore. The plates are scraped every day with rubbers, and are occasionally dressed with phosphate of lime, or with lye. The battery is cleaned out once a week, and yields 50% of the amalgam.

No. 12. *Plumas County.*—The ore is free-milling, and contains about 1½% of sulphurets. It is delivered to the Blake crushers in the mill by an incline tramway, and the ore passes through the bins to the Challenge feeders. The stamps weigh 850 lbs. each, dropping 8½ inches, 80 times per minute. The discharge varies from 6 inches to 8 inches, through No. 8 diagonal-slot punched screens, with a discharging surface to each battery of 45 inches in length by 6 inches in height. The mortar is furnished with a lip plate and a cast-iron trough, which receives the pulp, also with a 5-inch inside plate. The pulp passes from the trough to the apron and sluice-plates, which have a grade of 1¾ inches to the foot and a length of 20 feet, and is then passed to the concentrators. Below the mill the tailings are picked up by outside parties and re-ground in arrastras. The tailings assay $2 per ton. The loss of quicksilver at this mill is about a flask for every 4600 tons crushed. The cost of milling does not exceed fifty cents per ton when using water power. The plates are cleaned every twenty-four hours. About 60% of the amalgam is derived from the batteries, which are cleaned up once a month. The headings are placed in an iron revolving barrel, and the panning-out is done with a batea.

(*To be Continued.*)

* Bulletin No. 6, California State Mining Bureau.

## The Aluminum Industry.

Written for the MINING AND SCIENTIFIC PRESS by ORRIN E. DUNLAP.

Since the operation of the Pittsburg Reduction Company's plant at Niagara Falls, the output of aluminum has been very largely increased in the United States. This company is practically the only manufacturer of aluminum in the United States, and it controls and uses what is known as the Hall process, the invention of Mr. Charles M. Hall, who is now vice-president of the company. Under this patent the process of manufacture consists in dissolving alumina in a molten bath composed of the fluoride of aluminum and the fluoride of some metal more electro-positive than aluminum. An electric current is passed through the molten mass and aluminum is produced by electrolysis of the dissolved alumina. The fluoride of potassium and the fluoride of calcium with the fluoride of aluminum are the preferable salts used in the molten bath, although the fluoride of aluminum and the fluoride of sodium have been successfully used by the Pittsburg Reduction Company in much of its work. The double fluoride of aluminum and potassium is made by the action of fluorhydric acid upon alumina and pearl ash or carbonate of potassium. The fluoride of calcium is obtained from the mineral fluorspar. When the Pittsburg Reduction Company use the fluoride of sodium, it has in the past used largely the native mineral cryolite as the source of this portion of the salts, although of late improvements have been made by which cheaper methods of producing the double salts of fluorides of aluminum and sodium have been obtained over the use of the comparatively expensive mineral cryolite, which is mined in Greenland.

In the present plant at Niagara Falls, the Pittsburg Reduction Company has two lines of carbon-lined pots, twenty-nine in all, arranged in series with the electric current, and it is in these pots that the chemicals are placed. The electric current is passed through the molten mass by the aid of carbon cylinders used as anodes, which extend down into the molten metal. These carbon anodes are attached by copper rods to the main portion of the line conducting the electric current from the positive end of the generating machinery. Thus the pot itself, with its lining and the metal deposited upon the bottom, becomes the negative electrode, or cathode, and the pot is joined by copper connections to the line extending to the positive electrode in each pot. The alumina is deposited by electrolysis in a molten mass at the bottom of the pot by the passage of the electric current through the molten mass. The freed oxygen goes out as carbonic oxide or carbolic acid gas in connection with the carbon of the anode, wearing it away in proportion of a little less than an equal weight of the anode to the aluminum produced. The operation is kept continuous for months at a time, as the wear upon the pots is very slight, the metal being dipped out from the pots each day by heavy cast-iron ladles, replacing the electrolyte on the top of each ladleful of metal with the carbon rods. In some countries the makers of aluminum are greatly troubled with noxious gases, and their employes work only for very short periods. The Pittsburg Reduction Company, however, by the advantages of the special chemical solvents which it uses for dissolving the alumina and the particular strengths of current adopted, is not troubled in this way; there being practically no discharge of foreign or other noxious gases into the atmosphere; the only gas evolved being practically carbonic acid. Now and then a carbon will heat above the bath and sputter out in a dark blue flame, showing the burning of carbonic oxide to carbonic acid gas, and indicating the heating power of the current.

The temperature of the molten bath is kept constant by the passage of the electric current through it, the resistance of the bath generating sufficient heat for this purpose. In the Pittsburg Reduction Company's works currents of very large quantities in amperes and of low voltage are used, the pressure required being only enough to overcome the electrical resistance of the number of pots arranged in series, each pot now in use requiring from six to eight volts. The electric power used by the Pittsburg Reduction Company is supplied by the Niagara Falls Power Company, and is of the two-phase class, alternating, and of 2000 volts pressure. It is conducted from the power house to the factory on copper cables laid in a subway. In the manufacture of aluminum it is necessary that this current should be reduced as well as transformed from alternating to direct. The static transformers shown in the illustrations reduce the voltage of the current from 2000 to 115, and the rotary converters shown change the current from the two-phase, alternating, variety of 115 volts to a direct current of 160 volts. The electrical equipment of the Reduction Company's plant was furnished by the General Electric Company of Schenectady, N. Y., and is one of the finest in the world. The rotary converter is practically a direct-current generator, with proper collecting rings and connections attached to the rear of the armature to lead the alternating current into the apparatus. Practically it is a generator and motor combined in one machine. The Pittsburg Reduction Company's present electrical plant has a capacity of about 10,000 amperes at 160 volts or 1600 kilowatts, or about 2000 electrical H. P. on the direct-current side. The static transformer has an efficiency of about ninety-eight per cent, and the energy transformed into heat is so great that there is not sufficient radiating surface to throw it off; for this reason an air blast is forced continuously between the coils from below, thus keeping the heat easily under control.

There is a commonly accepted notion that clays are the ores of alumina. The Pittsburg Reduction Company does not use clays which are silicates of aluminum in the manufacture of the metal, but the pure oxide of aluminum, called alumina, which is made from the native oxide of the metal in a mineral that is called bauxite. This mineral is found in large deposits in Georgia and Alabama, and it is from these States that the Pittsburg Reduction Company secures its supply, finding it possible to lay the ore down at its factory in Niagara Falls at a low rate. The bauxite belt of Georgia and Alabama extends in a northeasterly and southwesterly direction through the counties of Floyd, Polk and Bartow in Georgia, and Talladega, Cleburne, Calhoun, Cherokee and Etewah in Alabama, its length being about seventy-five miles and its width about ten miles. The ore is found in pockets at the top of the Knox dolomite of the lower silurian rocks in both of the States mentioned. It is noticeable that the bauxite ores in the United States are all in sections of the country which have been broken up by sharp folds and great thrust faults, in which the character of the rock has been greatly changed, probably the result of intense heat.

The bauxite ores of Georgia and Alabama are associated with the manganese and iron ores, which similarly occur in the same district in "pocket" formations, as do the bauxites.

The manganese ore associated with the bauxite has about the following composition:

| | |
|---|---|
| Manganese | 43.73 % |
| Phosphorus | 0.129% |
| Silica | 0.353% |
| Metallic Iron | 0.101% |

The composition of iron ore as associated with the bauxite is as follows:

| | |
|---|---|
| Oxide of Iron | 71.36 % |
| Silica | 6.73 % |
| Titanic Acid | 0.00 % |
| Phosphorus | 0.066% |

The composition of the bauxite best adapted for the manufacture of alumina, and which occurs in large quantities in the States of Georgia and Alabama, is as follows:

| | |
|---|---|
| Silica | 3.00 % |
| Titanic Acid | 4.00 % |
| Oxide of Iron | 2.00 % |
| Water of Hydration | 32.00 % |
| Alumina | 59.00 % |
| Total | 100.00 % |

This ore exists in several peculiar forms, as follows:

1. In round nodules or pisolites, some of these being in sizes up to two inches in diameter and each nodule being separated from its fellows.
2. An agglomeration of these nodules into a conglomerate, the binding material between the nodules being pure alumina.
3. A massive formation.
4. A fine powdered condition in the beds at the banks, being mined in the form of plastic mud.

Thousands upon thousands of tons of this ore have been mined. To form aluminate of soda it only need be incinerated lightly with soda ash. This aluminate of soda is dissolved and decanted off and freed from the impurities of silica, oxide of iron and titanic acid, which have not been acted upon and are insoluble in the hot water used for solution of the aluminate of soda. It is from this solution alumina is precipitated by passing carbonic acid, formed by the distillation of carbonic acid from limestone, through the solution and also by agitation. The carbonic acid reforms carbonate of soda from the aluminate and precipitates the pure aluminum very freely. This settles at the bottom of the tank, and after being thoroughly washed with hot water and then dried, it is heated for some time at a high red heat to drive off the water of hydration, which makes the ore ready for the production of aluminum by the Hall process.

So successful has been the Pittsburg Reduction Company's Plant at Niagara Falls that, for all it was started on August 26, 1895, the company has already taken steps to double its capacity and has placed orders for the necessary transforming machinery with the General Electric Company of Schenectady, N. Y. This increase of capacity will be effected by raising each of the four rotary converters from 400 to 600 kilowatts capacity by rebuilding them and the installation of an additional rotary converter of 600 kilowatts. The static transformers will likewise be increased and added to. This will give a total of 3000 kilowatts, as compared with the 1600 now in use, or nearly double the present capacity. At present the Pittsburg Reduction Company is receiving 300 amperes on each of two phases at about 2000 voltage.

The plant as erected with the Niagara Falls Power Company was planned for doubling the capacity in the same buildings, and the contract arrangements which the Pittsburg Reduction Company has with the Niagara Falls Power Company are that it has the opportunity to call for additional power up to any capacity that is unsold by the Niagara Falls Power Company at the time when such power may be asked for; so that the Pittsburg Reduction Company enjoys the right to enlarge its works almost indefinitely at comparatively very small cost for installation of new plant, as the capacity of the Niagara Falls Power Company and its rights to the use of water-power at Niagara are practically illimitable.

Besides these favorable arrangements, however, the Pittsburg Reduction Company has contracted with the rival water power company at Niagara Falls, the Niagara Falls Hydraulic Power and Mfg. Co., for 4500 electrical H. P. additional. This plant is now progressing rapidly and will be completed in the early spring. Thus the Pittsburg Reduction Company is in position to enlarge its use of the Niagara power from both large power sources—one, the Niagara Falls Power Company, using the tunnel; the other, the Niagara Falls Hydraulic Power and Mfg. Co., using the hydraulic canal passing through the city of Niagara Falls. The 4500 H. P. from the canal will be used in a factory now in course of construction on the high bank of the gorge, and when completed the company will have an upper and a lower works, one being on the upper river above the falls, and the other below the cataract. The electrical equipment in the new or lower works will consist of dynamos directly attached to the turbine shafts. These generators will be of 750 electrical H. P. each, the turbines to operate them being of 1800-H. P. each and furnished by the James Leffel Co., of Springfield, O. In this plant the electric current will be transmitted from the power house at the water's edge in the gorge to the pot room in the factory on the high bank above on aluminum conductors—an innovation, by the way, as copper conductors are generally used. This new plant will be ready for operation next spring, and it is officially stated that by June 1st the Pittsburg Reduction Company expects to be making 10,000 pounds of aluminum per day at Niagara Falls.

In addition to the plant manufacturing aluminum at Niagara Falls, the Pittsburg Reduction Company has its old plant of some 2000 electrical horse power successfully working in the manufacture of aluminum at New Kensington, Westmoreland county, Pennsylvania. This plant is especially located for generating steam power economically.

The product of the Niagara plant is now being shipped in ingot form to its New Kensington works by the Pittsburg Reduction Company, where its foundries, rolling mills and hammer shops are located for forming the metal into sheets, bars, plates, tubes, wire and castings. The Pittsburg Reduction Company does not manufacture any articles of aluminum, as it does not care to become competitors of its own customers.

It is a significant fact of the efficiency of the cheap electric power of Niagara that it is a successful competitor of the Kensington, Pa., plant. The latter factory is located most favorably in the heart of both the natural gas and cheap coal fuel districts, which have made Pennsylvania famous, and for all the Pittsburg Reduction Company bought coal delivered at its boilers for 65 cents a ton, still it has found its Niagara location more advantageous.

When it is considered that this company within a few months will be turning out 10,000 pounds of aluminum a day, its importance to the industry is best shown by a table showing the product of aluminum in the United States each year since 1882, which is as follows:

| *Year—* | *Pounds.* |
|---|---|
| 1883 | 83 |
| 1884 | 150 |
| 1885 | 263 |
| 1886 | 3,000 |
| 1887 | 18,000 |
| 1888 | 19,000 |
| 1889 | 47,468 |
| 1890 | 61,261 |
| 1891 | 150,000 |
| 1892 | 259,885 |
| 1893 | 339,629 |
| 1894 | 550,000 |

The total output in the United States for 1895 reached about 850,000 lbs. The output for 1896, it is estimated, will be fully 10,000 lbs. a day for the 366 days of the year, or a total of 3,660,000 lbs., which will be the most notable increase in the output during any one year since aluminum was discovered. This will be over three times more aluminum each day than was made during the entire year of 1886, when the output was but 3,000 lbs., surprising progress for one decade.

The latest price list of the Pittsburg Reduction Company quotes aluminum guaranteed to be 98 per cent pure at 55 cents per lb. in small lots; 52 cents per lb. in 100-lb. lots, and 50 cents per lb. in ton lots, which price is likely to be reduced next year.

It was in 1885 that the first step towards the manufacture of aluminum for industrial purposes was taken in the United States. This was in the Cowles Electric Smelting and Aluminum Company's works in Cleveland, O., when they began to make aluminum bronze, which event marks the beginning of the dynamo-electro metallurgy in the United States. It was in 1888 that the Pittsburg Reduction Company began the production of aluminum for commercial purposes by the Hall process, and the prospects are that these works will increase in importance each year.

# Electrical Progress.

## Application of Electrical Power.

The Siemens & Halske Electric Co. of America have sundry devices for generating electric energy and reconverting that energy into mechanical motion that are worthy of notice. On this page is shown (Fig. 1) a centrifugal extractor. The armature is connected directly to the shaft of this machine. The frame of the motor is movably supported in a ball and socket joint, so that the motor can oscillate with the centrifugal machine.

Fig. 2 shows a sinking pump, used in mining. Pump and motor are supported by an iron frame suspended by chains and blocks, permitting the pump to be lowered and raised. The electric motor is geared to the pump piston.

Figs. 3 (lathe) and 4 (drill press) illustrate arrangements with cone pulleys for the variation of speed. Both the motor and the countershaft are mounted on hinged supporting plates. The cone pulley of the countershaft and cone pulley of the main shaft are connected by short belts. The belts are kept taut by the weight of the motor and the weight of the countershaft.

By means of a lever the distance between the hinged supporting plates may be decreased, the belts slackened, and so easily shifted on the cone pulleys for speed variations.

A. E. Brooke-Ridley, 10 Front street, San Francisco, is the Pacific coast representative of this company.

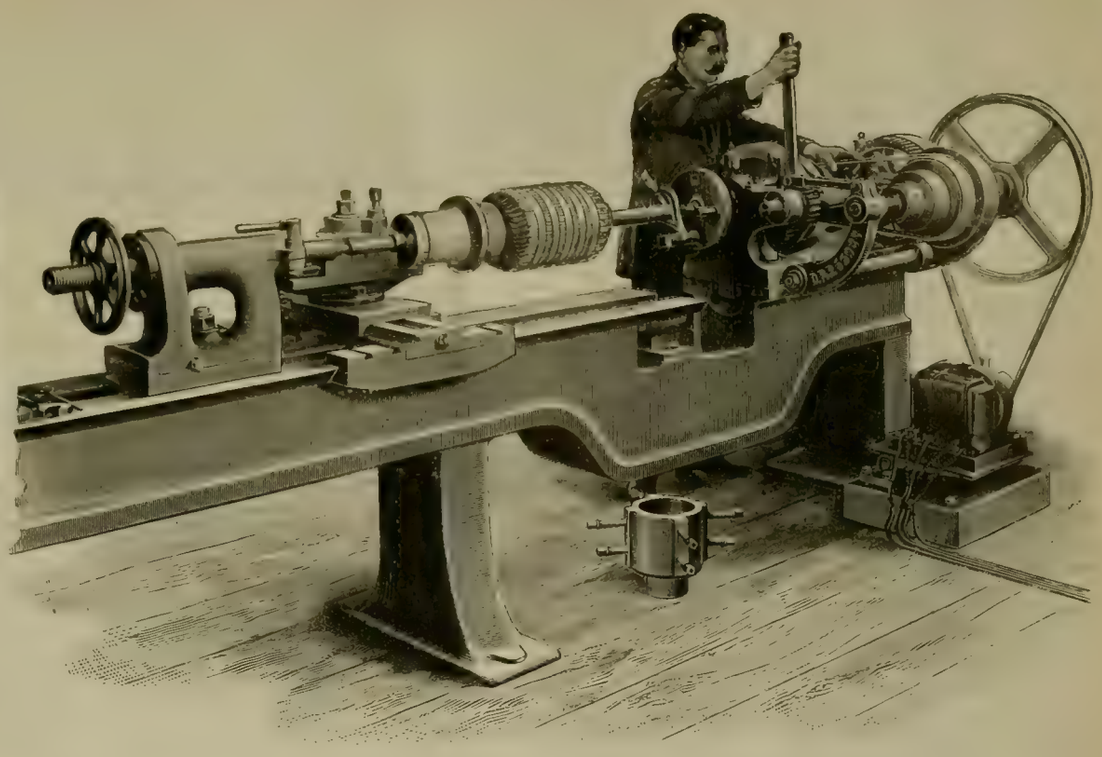

FIG. 3.—ELECTRIC LATHE.

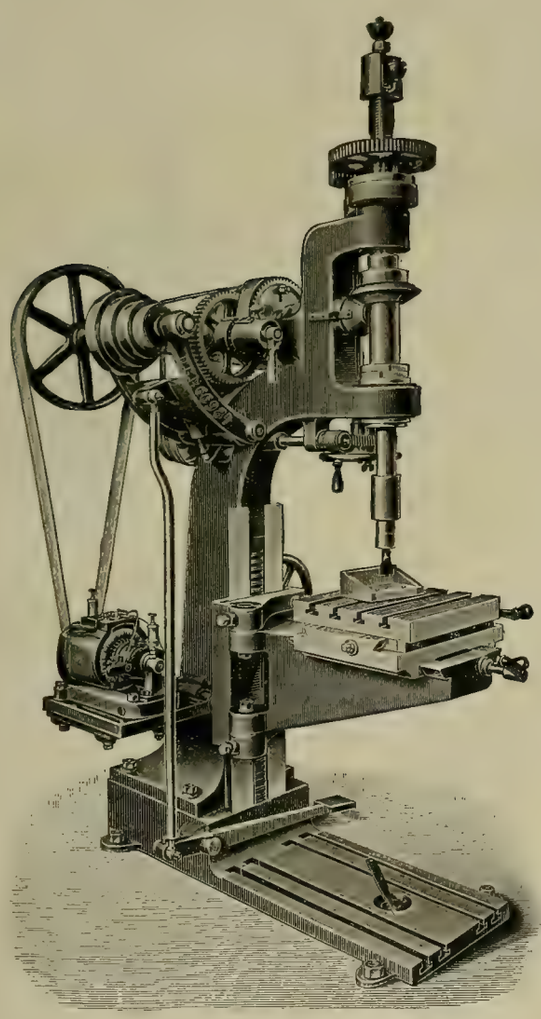

FIG. 4.—ELECTRIC DRILL PRESS.

In connection with the underground electric or conduit system, a proposition comes from Washington of a plan not to mount an electric motor on the car, making its connection with the source of supply through the slot, but to have the conduit subway large enough to carry another set of tracks with motors running on them. In this way any ordinary car can hook on to one of these invisible motors and be whirled along and the whole electrical system removed from the surface of the street.

## Steam and Electricity.

A fear, entertained by some people, that electricity as a motive power might absolutely supersede steam, is hardly well based. An illustration of this may be found in an enterprise which was conceived many months ago and is now progressing toward practical results for connecting the cities of Baltimore and Washington by an electric railway. The road runs parallel with the Baltimore & Ohio and Baltimore & Potomac railroads. The road will have double tracks, and the purpose of the company is to have the 42 miles traveled by passenger trains in 28 minutes, at the rate of 90 miles an hour.

But electrical currents when artificially created do not generate themselves. The Baltimore & Cantonsville Construction Company have therefore entered into contract with a firm of stationary steam engine builders for the construction of eight engines of 1000-horse power each to furnish the necessary power for this plant. They are to be of a direct-connected, tandem, compound, condensing variety, of a new pattern. The high-pressure cylinders will be of 22 inches internal diameter and the low-pressure cylinders 42 inches. The shaft will be made of a forging 22 inches in diameter, to which will be attached either one or two generators, together with a 16-foot flywheel, weighing 70,000 pounds. The aggregate weight of each engine will be 104 tons, or a total weight of 1,664,000 pounds for the eight engines. The length of the stroke will be 42 inches, with a steam pressure of 125 pounds, which will produce 100 revolutions a minute.

Thus it is shown that, instead of the substitution of electricity for steam as a motive power, electricity is a companion agent with steam, and that one operates as a stimulant to the use of the other.

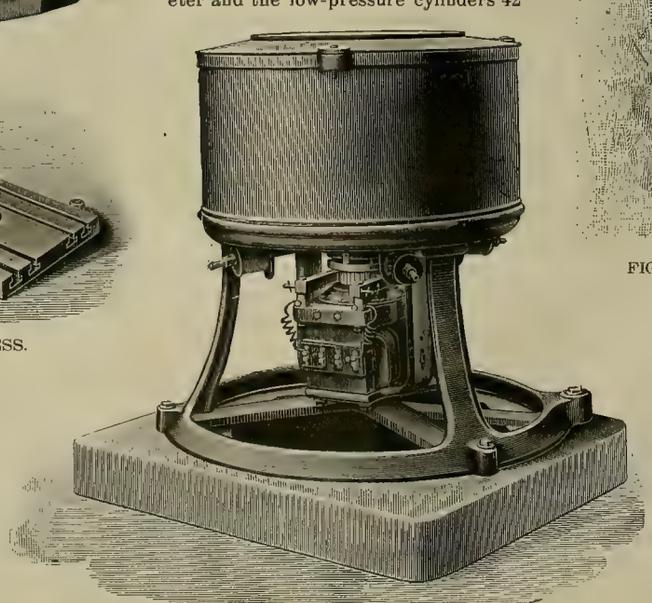

FIG. 1.—CENTRIFUGAL EXTRACTOR.

# Scientific Progress.

## Age of the Earth.

Clarence King has in preparation a new scientific lecture in which he calculates the age of the earth, since it assumed the solid form at 20,000,000 years. His deductions are not empirical or hasty conjecture. He has given the matter thought, has made many elaborate and long-continued experiments, both in San Francisco and elsewhere, and in some respects has gone at the investigation on different lines from some of his colleagues and predecessors.

The age of the earth has long been an attractive theme of speculation and inquiry. Within the memory of many now living it was an article of faith that the globe was about 6000 years old. Scientific research has produced cumulative proof that the globe on which we play our brief parts is of vast antiquity. About thirty years ago Sir William Thompson pointed out that the ocean tides retarded the speed of the earth's daily rotation. The earth loses in this way about ten seconds a century. From this he calculated that the present figure of the earth is about the same as it would have assumed many millions of years ago from the action of centrifugal force and the cause mentioned, on the supposition that the earth was then in a partly fluid state.

Another point of view was from thermo-dynamics. The laws of pressure and heat conduction are the keys to the true physical condition of the earth in the distant past. He pointed out that, knowing the rate of increase of temperature from the surface downward towards the earth's interior, and knowing the present rate of heat conduction and radiation from the earth, it was an easy matter to calculate backwards and ascertain what the temperature of the earth was at any time in the past, and that it was also as easy to calculate what the temperature of the earth would be at any time in the future from its observed condition in the present. The rate of increase of underground temperature is now taken to be about 1° Cent. for every thirty yards of descent. At the depth of twenty-five miles this gives an increase of 1500° Cent., or the temperature at which everything with which we are acquainted would be in a state of fusion. Calculating backwards, he found that if the same physical laws existed in the past as exist to-day, we arrive at a point in the earth's history when its temperature was so high that the materials which compose it could not have existed in a solid state.

Owing to the lack of certain necessary experimental data, such as the fusion point of certain rocks and earths under pressure, he was unable at that time to make any absolute calculations as to the earth's exact age, and he pointed out the experimental data that were necessary to make the calculations conclusive. This experimental data has now been ascertained by Clarence King, who has conducted recent elaborate experiments. He took the rock diabase as an average sample of the earth rock, and ascertained its point of fusion at various pressures, going up as high as 2000 atmospheres pressure. It is, of course, well known that the fusing point of substances depends upon the pressure to which they are subjected. The great majority of substances have their melting points raised by increase of pressure, so that, for instance, while the temperature of the earth's interior may be sufficient to melt these substances, yet they remain solid because of the pressure to which they are subjected.

After Prof. King had completed his experimental investigations he constructed a series of "temperature gradients" or tables with diagramatic representations of temperature and pressure from the surface to the center of the earth. He found that while there is really a very slight change of temperature from the surface to the center below a certain superficial depth, the pressure augments with one downward sweep to the center. It passes 1741° Cent. at 175,000 atmospheres, and the 3900° Cent. line at 390,000 atmospheres, thence steadily augmenting until at the center it reaches over 3,000,000 atmospheres pressure. The empire of heat over pressure is confined only to the superficial layer of the earth; that of pressure over heat being not far below the surface and increases steadily downward to the center.

The charts of Prof. King show a great many possible earth temperature gradients ranging around the temperature gradient of the rock diabase, but the only gradient he finds which satisfies all the conditions is the gradient showing a temperature from the earth's center to within fifty-three miles of the surface of a little under 2000° Cent. (about the melting point of platinum), necessitating 20,000,000 years' secular cooling with a surface rate of radiation of 1° Fahr. to 50.5 feet of depth. From this it is deduced that the earth's interior is rigid and solid. Below the fifty-three-mile limit the materials are solid by compression; above that limit they are solid by refrigeration. The temperature of the earth, as a globe, according to Prof. King's investigations, never exceeded 2000° Cent., and the central portions are made up of very dense substances, such as metals and their compounds, thus assuming that the earth is absolutely rigid and solid from surface to center, except occasionally here and there in very small areas.

---

IT IS TIME, says Dr. Armstrong, president of the Chemical Society, that we ceased to speak of substances as pure, as a pure substance is and must ever remain an ideal conception; and while there can be an infinite number of degrees of impurity, there can be none of purity. The much misused phrase, "chemically pure," has no abstract meaning and should be discarded, it is usually nothing more than a convenient fiction, made use of by sellers of chemicals. Thus, the presence of arsenic in zinc being objectionable because zinc is used in testing for arsenic, it became customary to sell zinc freed as far as possible from arsenic as chemically pure, although other impurities were often present in such zinc in considerable quantities. Purified should be substituted for pure. Chemists are sufficiently serious offenders, but others also are not infrequently guilty of like thoughtlessness, as, for instance, when a paper headed "* * * Properties of Pure Iron" is prefaced with an analysis showing the presence in the "almost pure iron" of small amounts of carbon, sulphur, silicon, and manganese in what is first spoken of as a sample of very pure iron. Or when, again, it is stated that "the yield will of course depend on the amount of purity required. From * * * * about one-tenth of quite pure * * * * can be obtained, and about one-twentieth of very pure." Language may, indeed, be said to be an instrument for the concealment of thought when these abuses of it are possible. Surely, if devoted to science, we should be scientific in all things.

---

A RECENT number of the *Zeitschrift fur Elektrotechnik und Elektrochemic* says that at the annual meeting of the German Electro-Chemical Society Dr. U. Borchers exhibited an apparatus by which he not only succeeded, nearly ten years ago, in preparing calcium carbide, but also showed that all the oxides which were regarded as irreducible could easily be reduced by the action of carbon. It consists of a small chamber or furnace of firebrick, through the walls of which pass thick carbon rods 50 mm. in diameter. Inside the chamber these are connected by a thinner carbon rod, 4 mm. in diameter and 40 mm. long. The furnace is fed with a mixture of iron and carbon. The action is not electrolytic, the effect of the current being simply to heat the lime to a temperature at which it is reduced by the carbon.

---

THE World's Fair medals, 23,857 in number, have been received at the United States Treasury Department, Washington. The medals will be held there until the commission meets and adopts measures for their proper distribution.

---

METALLIC glucinum is now quoted at $17.85 per pound. The specific gravity of this metal is 2.1. It is white, malleable, resistive to oxidation and susceptible of a high polish. The electrical conductivity is stated to be as high as that of silver.

# Mechanical Progress.

## Some Technical Notes Relating to Chain Blocks.

The two most important elements in a hoisting machine are the velocity ratio and the mechanical efficiency. The velocity ratio, or leverage, is the number of feet of rope or chain which the operator must overhaul with his hands to lift the load one foot. With a low velocity ratio, the operator can lift only a small load, but can lift it quickly; with a high velocity ratio, he can raise a large load, but only slowly. The mechanical efficiency of a hoist is a term which indicates the percentage of the applied power which is utilized in lifting the load, the difference between the power applied and the power utilized being the amount of power consumed or wasted in overcoming the friction of the machine. Common hoists rarely have an efficiency of more than 50 per cent., which means that of each 100 foot-pounds of energy applied by the operator, one-half is utilized in lifting the load and the other half is wasted in overcoming friction. In most chain blocks the efficiency is necessarily less because of the unavoidable friction of the chain, and still more because of the self-sustaining feature which such blocks usually possess.

FIG. 1.

Herewith is illustrated the triplex block, a worm-gear or screw block, and a differential pulley-block, which latter

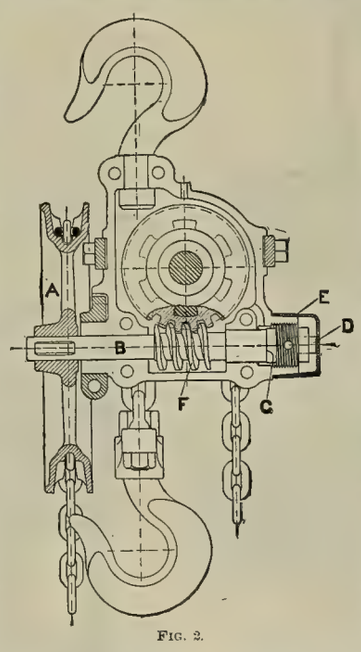

FIG. 2.

for many purposes is the most convenient chain block in the market, as it has the fewest parts of any block made and is the least likely to get out of order. Besides being a powerful hoisting device it also has the great advantage of being self-sustaining, so that under no circumstances will the load run down even if the chain be entirely let go. It is the combination of both of these properties which gives the block its practical value.

The differential block (Fig. 1), consists of a pair of pocketed chain wheels above, and a single wheel below. The endless chain passes over one upper sheave, down around the bottom block and then over the other upper sheave. The two upper sheaves are in one piece and only differ enough in diameter to

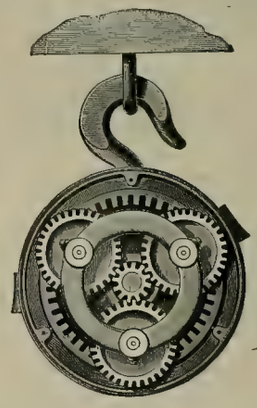

FIG 3.

make a difference of one chain pocket in circumference, or less than one-third of the length of a link in diameter.

In the Yale duplex controvertible screw block the leverage by which the hoisting capacity is obtained is that of a screw motion or, more properly, a worm and worm-wheel motion. The construction is such as to permit a much higher efficiency to be obtained than is practicable with an ordinary worm-wheel motion, and the device by which the load is sustained, and which acts in conjunction with the worm, is capable of conversion at the will of the operator, so that a dispatch lowering

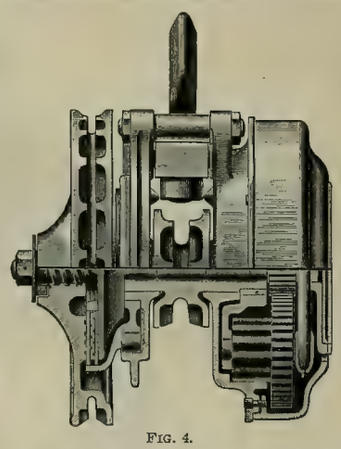

FIG. 4.

action may be obtained when desired. As shown in Fig. 2 the worm wheel is placed between the two chain sheaves and all the parts symmetrically disposed.

The Yale-Weston triplex spur-gear block is claimed to utilize eighty per cent of the workman's labor, accomplished by separating the sustaining mechanism from the hoisting gear, so that the operator is not wasting a large part of his effort in overcoming the resistance of the friction upon which the sustaining feature of the block depends.

The hoisting mechanism is shown in Figs. 3 and 4, and consists of a direct train of spur gears from the small pinion on the central shaft to the internal gear wheel cast within the main frame. The three intermediate gears between the pinion and the internal gear are carried on the circular frame or cage, and roll around with the internal gear, thus forming a sun and planet motion by which the desired leverage is obtained.

The advantages resulting from this triplex arrangement of gears are: increased wearing surface, subdivision of strains, and an accurate equalizing of the load. The frame upon which these intermediate gears are mounted is keyed fast to the hub of the hoisting chain sheave, and the central pinion shaft is operated by the hand chain wheel, so that the power of the operator is transmitted from the hand chain to the load chain through a

direct spur-gear train of high efficiency, with a leverage of about 30 to 1.

The sustaining mechanism is placed at the hand chain end of the block (the left of Fig. 4), and consists of a set of brass friction discs, the discs being alternately attached to the central axis and to a ratchet check wheel. The hand chain wheel is screwed upon the central spindle as shown, and the construction is such that it is clamped tightly by the friction discs to the shaft, either if it is rotated in the direction for hoisting, or if the shaft attempts to revolve in the opposite direction under the pull of the load. The parts being thus clamped together act as one, and the ratchets offer no resistance to the effort of the operator in hoisting. When the direction of the hand chain is reversed the alternate discs are released, and the others being held by the ratchets the load is lowered against their friction at a rate entirely controlled by the movement of the hand chain, while the stoppage of the hand chain movement causes the discs to tighten at once and sustain the load perfectly.

### A Visionary Scheme.

TO THE EDITOR:—I clip the enclosed from the New York *World*:

TO ROLL OVER THE WATER.

A FRENCH ENGINEER IS BUILDING A STEAMER ON HOLLOW IRON WHEELS.

There have been many novelties invented for ocean navigation, but one of the most extraordinary of these, and the latest, is the so-called roller steamer which is being built by M. Bazin, a French engineer. The steamer is in the form of a large raft, supported by hollow iron wheels, which revolve in the water and support the deck, some 22 to 23 feet above the surface.

Mr. Bazin claims, not only enhanced speed, but greater stability. He maintains that the surface friction will be minimized by the boat's rolling over the water, instead of cutting through it. The trial steamer for service on the British channel is now being built and the first test is eagerly looked forward to by the inventor and his friends, who are confident that the vessel will mark the beginning of a new era in naval construction.

The boat which is now being built will be 131 feet in length and will have a breadth of 39 feet. She is to consist of a platform having on each side four enormous wheels, and these will be revolved by the engines, which are to be centrally located.

In 1860 I thought I would revolutionize navigation with a boat on wheels or drums. I built a model about three feet long with three drums—one in front and two behind, so as to have a clear space for the rudder. On it I arranged clockwork to revolve the drums. Then, in company with an engineer named Green, who had great faith in my invention, I took the boat up to the reservoir at the foot of the "Sugar Loaf" at Nevada City. We wound up the clockwork and started it across, about 400 feet. It paddled off very nicely and we were very well pleased. We tried it over and back very carefully. Then, being prepared with a block of wood cut "ship shape" of exactly the same displacement, we transferred the clockwork, with paddles, to it and started it across the pond; but, much to my disgust, it made the trip in about half the time required by the great invention. So the clockwork was all we brought back to town.

About two or three years after this a man named Hopkins (I think) got out a patent on the identical same thing, a picture of which was published in the *Scientific American*. It was represented as going up the Hudson river with a lot of passengers and making a speed of something like 40 or 50 miles an hour.

While Hopkins was getting out his patent, a young engineer, Seibert by name, the inventor of the *first* sight-drop lubricator for steam engines, was then located up in Oregon or Washington. He conceived the idea and actually built a large boat on this plan, to run up the rapids at The Dalles, on the Columbia river. We never heard of it after its first trial.

Next Robert M. Fryar, the instigator and inventor of the "great Fryar process" for extraction of gold, silver and, possibly, diamonds, after the failure of the great process, commenced on plans and specifications for a boat on the same general principles; but he contemplated four large globes, instead of drums. He went back to New York and started work on his boat. It was to be large and would undoubtedly cross the ocean in three or four days. He enlisted considerable capital in the enterprise, but the boat never crossed the ocean. Now comes the "French engineer." Look out for the steamboat when the whistle blows! Yours truly, etc.. JNO. PATTISON.

107 Crocker Building, S. F., Feb. 8, 1896.

### An Electric Locomotive.

A Philadelphia locomotive works has shipped to the Westinghouse Electric Works in Albany the first electric locomotive ever built for a steam railroad. The locomotive is 30 feet long, mounted on two four-wheel trucks and weighs 60 tons. It is geared for 800-horse power and is intended for freight. The wheels are 42 inches in diameter. It is built to be operated by either overhead or underground trolley wires. It carries no coal, firebox, smokestack or water-tank. Its cost is about $10,000.

## Practical Information.

### Salt Storm on the Union Pacific Railway.

Written by J. B. HAYNES, Omaha, Neb.

Superintendent Korty of the Union Pacific's telegraphic department, in speaking of a salt storm which occurred in Utah and Wyoming on New Year's day, and interfered with the working of the telegraph wires, said:

"On the afternoon of January 1 a very peculiar rainstorm occurred in eastern Utah and western Wyoming along the Union Pacific railway, extending from Ogden, Utah, to Evanston, Wyo., a distance of seventy-five miles. The rain consisted of salt water or brine. The clothing of persons exposed to the shower had, when dry, the appearance of having been sprinkled with whitewash. The windows in the stores and residences at Evanston were so encrusted with a salt deposit as to make it impossible to look out. Dr. C. T. Gamble of Almy, Wyo., a gentleman of undoubted reliability, states that the storm deposited in Almy alone twenty-seven tons of salt. 'This assertion may appear fabulous,' says the doctor, 'but nevertheless is true, as it has been proven by carefully estimating the quantity on a given subject in different parts of the camp. The area of Almy is something over nine miles, and three tons to the mile would make twenty-seven tons of the matter deposited. The salt, if collected and sacked, would make ten ordinary wagon loads. Those who doubt the above statements, go to figuring.'

"The salt storm lasted about two hours. After it had ceased raining the sun came out, and as fast as things dried they turned a whitish color, and it was found that everything was covered with a thick coating of salt. Cars, buildings, trees, telegraph poles, insulators and wires all looked ghostly in their white coats. Through Weber canyon the salt storm turned into snow later. A peculiar effect of the salt deposit on the telegraph poles, arms and insulators through Weber canyon was noticed in operating the wires. During the day, when the sun came out, the wires worked clear and without interruption, while at night when it turned cold the wires were rendered unserviceable, which was attributed to the fact that the snow, having melted some during the daytime and again freezing at night, created a moisture in conjunction with the salt deposit underneath, so as to entirely destroy the insulation of the wires. After several unsuccessful attempts to remove the cause of the trouble, an engine with a pump and long hose was sent over the lines and the deposits thoroughly washed off the poles and fixtures for a distance of forty miles. The wires of the Rio Grande Western railroad between Ogden and Salt Lake City were slightly affected the same way, as were also those of the Southern Pacific for a short distance west of Ogden.

"The only theory that is given for this phenomenal storm is that the salt raised in vapor over Salt Lake and was carried by the wind and deposited over the country for many miles to the eastward."

### The Internal Temperature of Rocks.

For several years past, says Prof. Agassiz in a communication to the *American Journal of Science*, I have, with the assistance of our engineer, Mr. Preston C. F. West, been making rock temperature observations as we increased the depth at which the mining operations of the Calumet & Hecla Mining Co. were carried on. We have now attained at our deepest point a vertical depth of 4712 feet, and have taken temperatures of the rock at 105 feet; at the depth of the level of Lake Superior, 655 feet; at that of the level of the sea, 1257 feet; at that of the deepest part of Lake Superior, 1663 feet; and at four additional stations, each respectively 550 feet, 550 feet, 561 feet, and 1256 feet below the preceding ones, the deepest point being 4850 feet.

We propose, when we have reached our final depth, 4900 feet, to take an additional rock temperature, and to then publish in full the details of our observations. In the meantime it may be interesting to give the results as they stand. The highest rock temperature, obtained at a depth of 4580 feet, was only 79° Fahr.; the rock temperature at a depth of 105 feet was 59° Fahr. Taking that as the depth unaffected by local temperature variations, we have a column of 4475 feet of rock with a difference of temperature of 20° Fahr., or an average increase of 1° Fahr. for 223.7 feet. This is very different from any recorded observations; Lord Kelvin, if I am not mistaken, giving an increase for 1° Fahr. fifty-one feet, while the observations based on the temperature observations of the St. Gothard tunnel gave an increase of 1° Fahr. for sixty feet. The calculations based upon the latter observations gave a thickness of the crust of the earth in one case of about twenty miles, the other of twenty-six.

Taking our observations, the crust would be over eighty miles, and the thickness of the crust at the critical temperature of water would be over thirty-one miles, instead of about seven, and eight and one-half miles as by the other and older ratios. With the ratio observed here, the temperature at a depth of nineteen miles would only be about 470°, a very different temperature from that obtained by the older ratios of over 2000° Fahr. The holes in which we placed slow registering Negretti and Zambra thermometers were drilled, slightly inclined upward, to a depth of ten feet from the face of the rock, and plugged with wood and clay. In these holes the thermometers were left from one to three months. The average annual temperature of the air is 48° Fahr.; the temperature of the air at the bottom of the shaft was 72°.

---

SHAVING a man in twenty-five seconds is a feat deserving of praise by all such as value their time. The feat has been rendered easy of performance by the construction of a shaving machine of wood, reported to have been made by Melchoir Farkas, a convict in the penitentiary of the city of Szegedin, in Hungary. Farkas was put to labor in the cabinet making shop of the prison, and, taking to his work with a will, he soon displayed great inventive ingenuity. With his machine he is said to have shaved all the inmates of the prison, nearly 150 in number, within less than an hour's time. The report fails to state, however, to what extent the shaving by machinery did or did not succeed in giving comfort to the sufferer in the chair.

---

THE evidence supporting the sensational claim of Dr. Eugene Dubois that a genuine link between man and the apes had been discovered has been submitted to recent scientific meetings, and its substantial character is admitted by even the most conservative anatomists. The remains were dug up in 1892 from the bank of the Bengawan river in Java, where they were surrounded by bones of the hippopotamus, the hyena, several species of deer, a gigantic pagolin, and other animals. Among all these bones there were four—a wisdom tooth, a skull cap, a left femur, and a second molar—that undoubtedly represent an animal hitherto unknown. It seems quite certain that the four bones belonged to one individual, although they were scattered fifty feet in the gravel. The skull has twice the internal capacity of any modern ape, but is small for a man of the size indicated by the femur; the femur is decidedly human, and its possessor must have walked erect, but up to this the human remains have never been found in lower pleistocene deposits; the teeth are larger than human teeth, with a development that is characteristically simian. Pithecanthropus erectus, as the animal is now known, seems to be assigned by all to a place between existing man and apes, but opinions differ as to whether it was a man-like ape or an ape-like man.

### Nails in Wood.

Recently tests have been made at Cornell University to ascertain the holding power of nails in wood. The summarized results of these show cut nails to be better than wire nails for all purposes. They show that the sharper point of the wire nail gives its advantage, and that when this point is removed before driving in, only a third as much force is necessary to pull it out again.

The surface of a nail is best if slightly rough, but raising the surface into rasp teeth, as is sometimes done with wire nails, weakens the hold by one-third. The sides are better if wedge-shaped, as in a cut nail, rather than parallel, as in a wire nail. After a nail has been driven in for some time its hold loosens, unless it has rusted in, which tightens it. If to draw a nail from white pine the force required is represented by ten, for yellow pine it is fifteen, for white oak thirty, for chestnut sixteen, for beech thirty-two, for sycamore twenty, for elm twenty, for laurel twenty. Generally speaking, if for drawing out a nail driven parallel with the fiber of the wood a force represented by ten is required, when it is driven at right angles to the fibers a force represented by fifteen will be required.

### Locks Half a Cent Each.

What is the price of cheap cabinet locks coming to? A Willenhall maker is selling them at 2s. 9d. *per gross*, or a fraction under a farthing apiece! When old George Thornycroft was mayor of Wolverhampton, half a century ago, he saw some Willenhall padlocks, which he was told cost twopence each, and on hearing a complaint that they were so badly made that some of them would "only lock once," Mr. Thorneycroft replied, "It would be a pity if they were made to lock twice for that money." What his views would be as to these farthing locks we do not hazard a guess.—Hardwareman, Eng.

---

PROBABLY nine people out of ten are under the impression that the extent and value of the agricultural products of the United States far exceed the value of the manufactured products. Instead of this being true, the total value of manufactured products in 1890 was $9,370,107,624, whereas the total value of all agricultural products for that year, as reported by the statistician of the United States Agricultural Department, was $3,800,000,000.

A SMALL-FLANGED third wheel with outstretching arms has been invented to be attached to an ordinary safety bicycle by means of which the rider can travel on a railroad track.

# Mining Summary.

## Dividends Paid by American Mining Companies in 1895.

The *Bulletin* has an approximately correct list of dividends paid in 1895 by incorporated gold, silver, copper, lead and quicksilver mining companies in this country. Such a list is difficult to correctly and accurately collate. There is always some mistake, and it is necessarily incomplete. Alphabetically arranged, the list is as follows:

| | |
|---|---|
| Adams | $6,000 |
| Alaska Treadwell | 400,000 |
| Alaska Mexican | 90,000 |
| American Development | 24,340 |
| Amethyst | 36,000 |
| Argentina-Juniata | 156,000 |
| Etna Con. Quicksilver | 30,000 |
| Bald-Butte | 13,000 |
| Bangkok-Cora Bell | 36,000 |
| Belden, F. E., Mica | 48,000 |
| Boston & Montana | 1,050,600 |
| Bullion-Beck & Champion | 325,000 |
| Calumet & Hecla (copper) | 2,000,000 |
| Centennial Eureka | 510,000 |
| Champion | 27,000 |
| Church | 16,200 |
| Con. California & Virginia | 108,000 |
| Coptis | 1,000 |
| Copper Queen | 150,000 |
| De Lamar | 540,000 |
| Elkhorn | 50,000 |
| Forepaugh | 16,000 |
| Golden Coin | 15,090 |
| Golden Fleece | 192,000 |
| Gold & Globe | 11,250 |
| Hecla Con | 115,000 |
| Highland | 50,000 |
| Homestake | 375,000 |
| Hope | 10,000 |
| Horn | 50,000 |
| Iron Mountain | 105,000 |
| Isabella | 22,500 |
| Jackson | 2,000 |
| Kearsarge (copper) | 40,000 |
| Kennedy | 340,000 |
| Le Roi, B. C. (gold) | 25,000 |
| Mercur | 175,000 |
| Mayflower Gravel | 29,910 |
| Mollie Gibson | 50,000 |
| Montana Limited | 205,000 |
| Montana Ore Purchasing | 160,000 |
| Moose | 72,000 |
| Morning Star Drift | 24,000 |
| Moulton | 30,000 |
| Mount Rose | 5,000 |
| Napa Con. (quicksilver) | 80,000 |
| Nugget | 5,000 |
| Osceola (copper) | 100,000 |
| Portland (gold) | 556,000 |
| Quincy (copper) | 600,000 |
| St. Joseph (lead) | 150,000 |
| Silver King | 263,000 |
| Smuggler | 350,000 |
| Standard Con | 20,000 |
| Tamarack (copper) | 200,000 |
| Temonj (gold) | 10,000 |
| Tomboy (gold) | 260,000 |
| Union | 13,000 |
| Utah | 17,000 |
| Victor (gold) | 240,000 |
| Victor L. and M | 9,000 |

The above dividends may be geographically distributed as follows:

| | *Mines.* | *Amount.* |
|---|---|---|
| Alaska | 2 | $ 490,000 |
| Arizona | 1 | 150,000 |
| California | 8 | 557,110 |
| Colorado | 21 | 2,220,750 |
| Idaho | 1 | 540,000 |
| Michigan | 5 | 2,940,000 |
| Missouri | 1 | 150,000 |
| Montana | 9 | 1,662,340 |
| Nevada | 3 | 111,000 |
| New Hampshire | 1 | 48,000 |
| South Dakota | 2 | 425,000 |
| Utah | 6 | 1,340,000 |
| British Columbia | 1 | 25,000 |
| Totals | 61 | $10,599,200 |

The dividends credited to Arizona and Michigan were from copper mines; those in Missouri and New Hampshire lead and mica respectively, while all the others were either gold or silver, or both. The dividends compare as follows with previous years:

| | *Mines.* | *Amount.* |
|---|---|---|
| 1881 | 60 | $13,653,400 |
| 1882 | 64 | 13,378,100 |
| 1883 | 60 | 10,130,200 |
| 1884 | 64 | 9,462,700 |
| 1885 | 53 | 8,290,600 |
| 1886 | 58 | 10,098,100 |
| 1887 | 65 | 10,480,700 |
| 1888 | 68 | 13,532,000 |
| 1889 | 75 | 12,210,400 |
| 1890 | 73 | 13,485,400 |
| 1891 | 102 | 16,929,800 |
| 1892 | 84 | 11,702,800 |
| 1893 | 56 | 8,753,000 |
| 1894 | 58 | 8,263,700 |
| 1895 | 61 | 10,599,200 |

Making a total of $170,890,200 in fifteen years, or nearly an average of $11,400,000 per annum.

### CALIFORNIA.

#### Butte.

The Standard Gold and Silver Mining Company at Oregon City shipped 6600 pounds of sulphurets to the Selby Smelting Works at Vallejo Junction last week.

Reports from Forbestown say that water has been struck in the big tunnel at the Gold Bank, and that the ledge has been found on the other side of the hill where the stream is located.

AT MAGALIA.—The Pershbacker mine employs twenty-seven men. At the Princess mine twenty-two men are at work. A new inclined shaft has touched the channel at a depth of 300 feet, and paying gravel is being taken out. The Oro Fino, Bader and Lucky John are each working with a small force of men. The Emma mine at Nimshew employs six men. The Best mine, on Bull creek, is also being worked.

#### Calaveras.

AROUND SAN ANDREAS.—*Citizen:* A new shaft is commenced at the Scieffard mine, to be ten feet in the clear with two compartments. Machinery will no doubt soon be put up.

J. S. Edelen, the new superintendent of the Fellowcraft mine, is pushing the work along with all possible speed. The incline shaft is now down about 130 feet.

#### El Dorado.

(Special Correspondence).—The old shaft and tunnel abandoned some years, for lack of capital, on the Union quartz mine, one mile east of town, are being cleaned and timbered preparatory to placing machinery. There is a five-foot ledge of high-grade ore on this property. It is owned by S. H. Maginess of Placerville.

The Edsall mine, a plant fairly well developed, has been bonded to W. C. Myers, who will at once push the work. This property has a six-foot vein of high-grade ore and is very rich in sulphurets. It is situated fourteen miles southwest.

The California Jack, twelve miles north, has been bonded by Los Angeles people, who are erecting a ten-stamp mill. This is another of the good properties abandoned years ago at shallow depth.

The Lone Star, situated four miles southeast of town, was transferred by D. H. Jackson a few days since to a party of San Francisco people, who have enrolled among their number a few of the Bostonian opera troupe. The Lone Star has enough tunnel and shaft work, and a few tons of good ore to encourage the expenditure of money for the purpose of discovering a richly paying mine.

Placerville, Feb. 10, 1896.

#### Inyo.

The *Index* states that at the Jordan mines at Copper Mountain, Inyo county, they have struck ore that assays 115 ounces in silver and $22.75 in gold, and have a ledge into which they have crosscut 125 (?) feet.

#### Napa.

QUICKSILVER SHIPMENTS.—The *Calistogian* says: During the month of January the following number of flasks of quicksilver were shipped from the various mines, as reported by Station Agent Ford: Napa 450, Sulphur Bank 345, Ætna 300, Great Western 94, Mirabel 140; total, 1320 flasks. In company with Postmaster Armstrong of this city the editor visited the Great Western mine last Friday, and was informed by Superintendent Rocca that nearly 200 men are being employed there. The output of this mine averages nearly 400 flasks per month the year around, but has been falling off some lately owing to repairs being made. After paying all the expenses there is a neat little margin left. The mining industry of Lake and Napa counties continues to draw men from all parts of the country. It is expected that the shipments from the mines this year will exceed all previous years.

#### Nevada.

The Federal Loan Mining Co. has let a contract to Peter Byrne and others to run a drift 200 feet on the 800 level of the mine, and has levied an assessment of five cents per share, payable March 9th and delinquent April 2d.

MASSACHUSETTS HILL.—*Telegraph:* The work of pumping out the old shaft on Massachusetts Hill, by the North Star Co., is now in progress. From the eight-inch discharge pipe, which is laid upon the dump trestle, there is continuously pouring sixty miners' inches of water, or something over a million gallons a day. This tremendous quantity taken from the old workings does not seem to decrease the supply rapidly, for there are miles of drifts to uncover. The inflow appears at present to be about 600,000 gallons a day. The pump is a compound differential plunger, built by the Dow Steam Pump Works of San Francisco. The initial cylinder is twelve inches in diameter, by thirty inches stroke. The capacity is ten gallons per stroke. This pump weighs, without water, 15,000 pounds, is twenty-two feet long and is suspended between guides in the pump-shaft by a steel wire cable. A special triple-geared hoisting engine raises or lowers it in the shaft easily, so that when blasting, or when repair or repacking is necessary, it may be brought to the surface in a few minutes. This pump is actuated by compressed air from the Rix compressors, situated at the North Star Co.'s power house on Wolf creek. The air, after being compressed to ninety pounds, is passed through a pneumatic reheater in the hoisting works and its temperature raised to 350° and its volume increased from forty to fifty per cent. This hot compressed air is conducted to the pump through well-insulated pipes and it loses very little of its useful heat in the passage. The hot air makes the pump run without shock or jar, and enables it to work economically. Using dry hot air for pumping is new to this State, and the results thus far from the pumping plant justify the conclusion that the method is a satisfactory one. This pumping plant is but one feature of the splendid power plant the North Star Co. has installed. It is to be hoped, for the good of the mining camp, that substantial success may crown the company's efforts. It is self-evident that, being equipped with modern and economical machinery, with buildings well situated, convenient and comfortable for miners, that the operating expenses should be a minimum, which means that rock which would have to remain untouched in the ordinary mine can here be successfully mined and milled. It takes courage and confidence to expend the amount necessary to equip this mine. It has been done, and if the results justify it it will make a new era in the method of mine prospecting.

NORTH BLOOMFIELD.—*Union:* Col. I. M. Taylor and others have been negotiating for the purchase of all the claims on the ridge from the Derbec to Moore's Flat.

Some time ago the Derbec Co. tried to buy the De Noon property, but could make no satisfactory arrangements for a purchase. The gentlemen now interested also tried to get this ground, but without avail, although there is still a possibility of making a bargain.

Col. Taylor has a telegram from New York that everything had been perfected and the deal for the property will be made in a few days. The company is an English one and has an unlimited amount of capital behind it. The property consists of 4000 acres and four miles of channel. It is calculated to run a tunnel 4000 feet in length into the mountain near Relief hill and tap the channel above the De Noon ground. The company expects to spend $50,000 in running the tunnel and opening up the channel.

#### Placer.

Auburn *Herald:* The Zantgraf made a clean-up Saturday last after a three weeks' run of their mill. It realized $16,000, or about $700 a day, besides the sulphurets.

Supt. O. L. Barton of the Herman mine, near Westville, tells the *Sentinel* that the company is working nineteen men and that the ten-stamp mill is running continually. The present working tunnel is sixty feet above the mill. A tunnel on the mill level is now in 400 feet, and they soon expect to crosscut the ledge. Bullion is being shipped.

*Sentinel:* Emanuel Polifka of Michigan Bluff has struck a fifteen-foot quartz ledge of $6 ore, four miles above the big trees and about three miles from Greek Flat.

#### Riverside.

The Briggs mine has been shut down several weeks, pending a contest in the land office, but that is amicably arranged and men are at work developing.

The hoist and boiler for the Golden Chariot mine is expected to be in place and in working order next week, when active development in the mine will be resumed.

J. B. Dennis has bought machinery for the Indian Queen mine. As soon as the water in the shaft and drifts can be handled development will be pushed and a millrun made on the ore.

#### San Bernardino.

RAND MINING DISTRICT.—The first quartz of any value was discovered here last May by Burcham and Singletou. They have several claims at present that are not being worked because of legal squabbles. Pat Reddy, of this city, is a partner with Burcham and Singleton. It is expected that the troubles will be speedily adjusted, when development work will be pushed.

The Black Hawk is three miles east of the town of Randburg, which has sprung up within the past three months. It is owned by Swarthout, Kuffel, Richard and Wilson. They have six men at work, sinking on the main ledge, and at a depth of 60 feet have started to drift to another ledge. The surface ore runs $60 per ton. One drawback is the distance from water, which has to be hauled by team over a heavy road twelve or fourteen miles. An eight-stamp mill is in course of erection at Cow wells, the water station. Ore will be hauled to the mill and crushed for $15 a ton. The owners of the Black Hawk contemplate the erection of a stamp mill at Cow wells, where they have an arrastra at work now.

CALICO.—The Pacific Coast borax mine, situated about eight miles northeast of Calico, at present employs about seventy-five men. It is divided into three shafts and each one has a force of miners of its own. Two small gasoline engines, respectively four and eight horse power, are used to hoist the borax to the surface, after which it is taken in cars to the bin, from which it is put into the big wagons and hauled to Daggett, whence it is shipped to Alameda, where it is refined and made ready for use. The ore, or borax, is drawn to the surface on two of the shafts in hide-covered buckets, and on the third in a skip which holds the same as a medium-sized car. At times, when the demand for borax is great, the force of men has to be increased until the order is filled and is then decreased.

At present there are three twenty-mule teams engaged in hauling ore from the mine to Daggett, which is about sixteen miles from the mine.

It requires three days for a team to make the round trip, as they camp about half way every second night. Two of the teams are owned by Seymour Alf of Daggett and the third by the company.

The wages were reduced from $3 to $2.50 per day and the board from $1 to 75 cents per day on the 1st of January.

The borax mine has produced more money in the last year than all the silver mines in the county.

#### San Diego.

AN EXTENSIVE PROGRAMME.—The Denver *Republican* says S. W. Dorsey, J. B. Grant, S. B. Morgan, Henry Bolthoff of the Hendrie & Bolthoff Manufacturing Company, and W. Teller have secured from the Mexican residents of Picacho, on the shore of the Colorado river, four miles from the basin, title deeds to about 500 acres of valuable mining property, and the work of erecting 100-stamp mills, constructing an electric railway to connect with the Southern Pacific railroad at Yuma, and setting up a modern town in the vicinity of the basin, will at once be commenced.

Papers were filed with the Colorado Secretary of State last week: the Picacho Gold Mines Company, capitalized at $3,000,000. The directors are the five gentlemen named above.

Picacho basin is the creation of volcanic agencies. It has for years been the source of a livelihood for a colony of Mexicans, who built their town, which is named after the basin, on the bank of the Colorado. Owing to lack of water this little colony in the desert of San Diego county has prospered only indifferently in the quest for the precious metal that runs rich through the rock formation of the volcanic dip four miles from their doors. Many years ago the appliances for treating the ore were crude in comparison with those now in use; the company, too, was poor, and after a short time its members gave up their scheme and abandoned the basin to their slow but patient neighbors, the Mexicans.

Their method of mining is one of the most primitive character. It is a combination of old-fashioned wet placer mining and the arrastra system.

Once and sometimes twice a year that section of San Diego county is visited by heavy rainstorms, known locally as torrential rains. The downpour soaks into the baked ground until it washes clay, gravel and weathered ore into a wet mass of ordinary placer consistency. This is panned in the regular way by the Mexicans, to whom a rainstorm means a harvest that must last out the remainder of the year, and the gold saved. When the torrential rains cease the entire adult population of the Mexican settlement spreads itself over Picacho basin.

Each miner is equipped with a broom of the finest texture, and the crowd is soon as busy as may be sweeping the gold-bearing dirt into pans. Every crevice and cranny worn by the rain into the basic ore is cleaned out and the particles of precious metal thus exposed collected carefully from the cleanings. Water for panning purposes is found in the rain pools that gather here and there.

Having exhausted the clay and gravel, the miners pry out such lumps of ore as have become loosened by the rain. These they pack upon burros and carry to the river bank, where they are subjected to the arrastra method of treatment. One piece of ore is rubbed against another until both are ground into particles small enough to be panned. This work over, the Mexicans betake themselves again to the ease of their "dobeys" to wait until another rainstorm visits their neighborhood.

It is the intention of the Picacho Gold Mines Co. to put up modern mills to run 100 stamps near the town of Picacho. When these are in place a railroad to be operated by electricity will be constructed between Picacho basin and the river, equipped with trains for hauling the vast quantities of ore to the mills.

From the river on the opposite side another electric railway will operate to Yuma, which is a station on the Southern Pacific, eighteen miles distant, so there will be no lack of accommodation for shipping the bullion. By the time the new district is in full working order considerable money will have been sunk, but there is no doubt that the gold in Picacho basin will richly repay the men who have engaged in the enterprise.

*Sentinel:* The Julian mining camp is attracting more attention this winter than at any time since the boomy days in the first few years of its history. There is more work under way, more work underground, and more gold being taken out, than at any time for fifteen years. A large number of mining men from all parts of the country are coming in, and a large number of prospectors in the field. There is plenty of room for all; the prospecting of the country has scarcely commenced, and the greatest depth reached in any one mine in the camp can scarcely be considered more than a prospect shaft.

#### Shasta.

BULLY HILL MINE.—Hugh McDonnell denies the current report that the Bully Hill mine at Copper City has been sold, but says a sale is probable.

Says the *Free Press:* It was originally a quartz mine, and was opened about twenty-five years ago. It had placed to its credit about $600,000 up to 1878, when it was abandoned, all the surface ores having been worked off, and since which time no work has been done in it until the present proprietors secured control.

At present the work under way is in the direction of cleaning out the old tunnel and driving a new one, which will cut the vein 275 feet from the surface. The tunnel is now in about 500 feet, and three shifts of men are engaged upon the work. It is proposed to penetrate about 700 feet, and three veins will be cut—a gold vein on each side of a big base ore which was worked some years ago.

These gold veins will run about $35 a ton in gold and a good big body of copper is assured, the ore showing about fourteen per cent of that metal. The ore now runs about sixty ounces in silver besides the gold and copper.

#### Sierra.

GENERAL NOTES.—*Messenger:* At the Plumbago quartz mine men are taking out ore. The mill has been temporarily closed.

In the Hope quartz mine active development work is being prosecuted. William Williams is foreman; nine men are employed.

Twenty-five men are employed at the Golden King quartz mine and the mill is crushing the ore extracted, with good results.

A bedrock tunnel is being run on the South Fork. Three shifts of three men each are employed.

At the North Fork pay gravel has been struck, and it is reported a dump and flume will be constructed at once.

At Maple Grove some prospecting has been done during the winter, and it is expected that very soon a force of men will be put to work.

About forty men are working at the B. M. Extension mine. Last week's cleanup aggregated eighty-five ounces.

THE HOPE MINE.—At the Hope mine at Alleghany the tunnel is in 150 feet, crosscutting to the contact, thence 380 feet southeast, and has yet about 100 feet to run to get under the old pay chute that was worked above. It was rich ore.

#### Siskiyou.

*Journal:* The Eastlick Brothers hydraulic mine at Oro Fino is running in full force. This mine pays $2.50 per day. About fifteen men are employed in this mine.

The Steamboat mine on McAdams creek will be started up in March.

The Success mine at Greenhorn is to be started up again under the superintendency of John Burgess. A river pump is being rigged up and it is thought there will be no trouble in keeping the water out, which has

been the means of preventing the operation of the mine for some time past.

The Ray Brothers of Oro Fino are getting out considerable rock at their mine. The ledge is not very wide, but is quite rich, the quartz averaging at least $40 to the ton. They will soon have an arrastra running at this mine.

Pitts and Goodfellor of Oro Fino are finding some very rich spots in their quartz mine. They have their rock crushed at the Johnson mill at that place.

Sam Gardner has twelve men at work in his hydraulic mine at Oro Fino, and will do well this season. He pays good wages and gets good men.

A. Erno of Quartz valley has an exceedingly rich quartz mine, and is taking out considerable quartz at present. He crushes his rock in an arrastra at the mine.

George Buchner of Etna also has a rich ledge in Quartz valley, called the Pinkham ledge. This is a small ledge, but the quartz usually runs from $60 to $80 a ton.

The Wright & Fletcher hydraulic mine at Oro Fino has started up, and will doubtless prove as remunerative as the other mines in this locality. This mine is among the best in this county.

The Espey, Hunter & Co. mine near Hawkinsville has been closed down since Sunday last, on account of the recent high water taking part of the dam out of the river that supplies the ditch. During the freshet sufficient water entered the ditch to keep all the wheels running, but as soon as the river went down water became scarce and the dam had to be repaired. The large pumps have been started again and will run steadily, to supply the giants at work in the claim.

### Trinity.

AROUND TAYLOR'S FLAT.—Pelletreau & Hedges are running steadily on their placer mine—the Highland—opposite Taylor's Flat. Their new ditch slid in places during the heavy rains of last month and cannot be used. A force of men is now employed in repairing and cleaning it out and will have it in running order by the 10th inst. At present the small gulches supply enough water to run an inch and a half nozzle on a canvas hose. The first two and a half days' run with the small pipe through a twelve-foot flume paid $250 in a partial cleanup. As soon as the ditch is in running order a No. 1 giant will be used and dirt moved much more rapidly and a good cleanup will be made for the season. The mine contains about forty acres of rich pay gravel, is a series of old channels, has a dump of from 900 to 1000 feet and is a valuable property.

Huestis Bros. are working the Don Juan mine this winter. They have run off about an acre of gravel through the high flume and will bottom up.

The Cedar Flat Consolidated Mining Co. of San Francisco, E. B. Hagans superintendent, is engaged in sinking shafts, prospecting and developing its properties at Cedar Flat. If the event justifies it, the mine will be worked on a large scale. They have found a rich high channel.

Gable and partners, who have Watson's Bar leased, are piping steadily and will undoubtedly do well.

Farther down the river Corning & Smith have fitted up their Hawkin's Bar claim and are mining.

On the point of the South Fork mountain between the junction of the South Fork and Trinity is one of the largest and finest gravel deposits in the State. There are thousands of acres of gravel that prospect well from surface to bedrock—in fact, are rich. At present there is no water to work it. It is a fine field for a big company. At present J. J. Morton is handling it.

A Weaverville dispatch says a Berlin syndicate has bonded the Bloss, McClary and Haskins mines, and the greater part of Trinity Center. The first payment is to be made April 1st, when the new owners take possession and put men to work.

### Tuolumne.

The 20-stamp mill at the App mine will be finished next week; eight concentrators will be put in. At the Rawhide the shaft is to be sunk to the depth of 1000 feet.

*Independent:* The Rawhide mine will be running by electric power on the 1st of March. This is the intention of the Electric Light Company, which has contracted to furnish 100-horse power to the mine by that date. The post holes are nearly all dug, and the poles are up as far as the forks of the Tuttletown road. Twenty-six men are employed, and the work is being pushed forward as rapidly as possible. The company met with a few obstructions in obtaining the right of way, which caused considerable vexation and delay. The company will have a telephone system in connection with its plant, so as to afford easy communication with the different stations and direct with San Francisco. The new 1000-light dynamo for the Sonora plant will be put in place as soon as possible. A line will also connect Sonora with the plant at the Marble Works, so when the water supply gives out here the electricity will be furnished from the dynamo at the river.

## NEVADA.

*Enterprise:* It is again reported that the Peck Brothers have purchased the Douglass mill tailings below Sutro and that arrangements will be begun to operate at the Rock Point mill about March 1.

The Holmes Mining Co. will shortly begin operations on the 300,000 tons of accumulated tailings at Belleville and Candelaria.

### ON THE COMSTOCK.

POTOSI.—The bullion report of the Potosi mine for January is as follows: Worked at the Nevada mill, 1030 tons of ore; gross proceeds in bullion, $20,632.03; cost of reducing, $6180; net proceeds in bullion, $14,452.03; assay value per ton, 320 tons, $31.29; 710 tons, $26.87; gross average per ton, $20.03; net average per ton, $14.03; mill worked 70 per cent; ore slimes considerably.

HALE AND NORCROSS.—The average assay of samples taken from the mine cars and railroad cars of the ore milled at the Brunswick mill during the month of January, 1896, was $32.81 gold and $50.90 silver; total, $83.78. The percentage of the average car sample is $81.53. The average battery assay of the above ore was $18.54 gold and $8.24 silver; total, $56.78. The percentage obtained of the average battery assay is 119.58. The gross yield from 424.5 tons was $28,969.

### CHURCHILL COUNTY.

THE DESERT MINES.—The Reno Reduction Works assay office has been very busy for a week testing ores from the Desert mines, near White Plains. Out of more than thirty samples none showed less than $5 per ton in gold, while many assayed from $20 to $125. It is the opinion of competent judges that there are many valuable gold mines in Desert district.

### LINCOLN COUNTY.

EL DORADO CANYON.—*Chronicle:* The district is situated three miles from the Colorado river and eighty miles from The Needles in San Bernardino county. It has long been known to contain silver in quantities, and for thirty years the Southwest Mining Company took out large quantities of the metal. The discovery of the gold deposit was, however, only made in 1894 by John Appel. It is in a different formation. A range of granite mountains extends along the county. At their base are foothills, where the mining is carried on. A peculiarity of the region is that the silver and the gold regions are distinctly separated by a great wash, forming the El Dorado canyon, whence the name of the new camp. Thus far seventy or eighty locations have been made, a number of which have been bonded for sale in the East. As yet only two groups of mines have gone beyond the embryo state. One of these is the Capitol, which is claimed under contract by A. S. Barney, but is being worked by Murphy and Monaghan with a 3½-foot Huntington mill. What they are taking out is known only to themselves, it being kept a profound secret, as Barney has brought suit against them for damages. He, however, has information that $2000 a week is being extracted. The other group is the Marie, and consists of four claims—the Marie, Black Cloud, Star and Belle. It is yet only a development. Its owners are mostly well-known San Franciscans. They are L. P. Drexler, John M. Wright, W. C. Wallace, J. C. Anthony, A. S. Barney, H. J. W. Dinkelspiel and George H. Sanford of Nevada. While the assays run much higher, the experts estimate the average value of the ore at $30 a ton.

They report that the formation is decidedly volcanic, traversed by fissures of gold-bearing ore, with occasional chimneys rich in gold. The enclosing wall rock is of porphyritic trachyte. The volcanic area consists of hills varying in height from 150 to 500 feet, situated at the base of a higher volcanic range, which is devoid of ore, but which changes to a complex volcanic combination of a silver-gold bearing nature. The auriferous deposit is found in the lower hills, and at an elevation of about 1300 feet above the Colorado river. Except for that stream the district is without water and contains no timber. Miners' wages are $3 a day and Indian labor costs from $1 to $1.50 a day with board. Supplies are purchased at Los Angeles, shipped thence by rail to The Needles, and from there to camp are hauled up the Colorado in boats by Indians. A couple of hundred whites are in the district. Some are working miners and others prospectors, but it is believed that all of the gold locations have been made by the first comers.

### WHITE PINE COUNTY.

E. C. Wood of the Cumberland & Osceola Gold Mining and Milling Company, Osceola, reports 1000 feet of work which has resulted in the disclosure of a big body of low-grade ore, while in the Cumberland 250 feet of exploration has revealed the presence of two distinct veins—one a fissure with well-defined walls, the other a contact. The company will, as soon as the snow departs, begin the erection of a mill, experiments having demonstrated in a test on 125 tons that amalgamation was the process adapted to the treatment of the product, although a test was made on cyanide and with the tri-cone rotary mill.

About May 1st the washing of gravel will begin on the placer bars in the sluicing of which the Osceola Gravel Mining Company has been the most active, and for which it has constructed two large ditches. From the waters that are thus controlled, the smaller companies that last year yielded between $10,000 and $15,000 in gold derive their supply.

## OREGON.

### JOSEPHINE COUNTY.

*Journal:* Gold is still coming into Grant's Pass in good quantities. This week over $4000 were turned into the bank for shipment. Jewell & Dodge shipped out over $1100, and Cramer Bros. some $400. Besides these sums, others went out through Wells, Fargo & Co.'s express, the aggregate of which we could not learn. Of the $4000 shipped by the bank, about $1700 came from the mine of Bent & Alexander, on Galice creek, and about $800 from the mine of the Black Gold Channel Co., on Footes creek. These are the results of only partial cleanups, and from now on the shipments will largely increase.

## WASHINGTON.

J. W. Draa, from Squaw creek, in the Methow valley, says if you want to buy mines it depends entirely upon the circumstances of the owner. Some might sell very cheap, because they must have the money, but the tendency is to want to sell an interest in the properties rather than the whole of them. The miner looks at it in this way: If he only sells a part and the mine proves to be of any great value, he will at least have a share of the wealth. But if he sells the whole thing, and it proves to be valuable, he will be "kicking himself" for ever having been so foolish as to sell, so for that reason you can secure a share in a mine for much less money in proportion than a whole one. That country is going to come to the front in time, for the reason that the ore is of such high grade.

Squaw creek district is on the Methow river. The Durr camp is on the east shore of the Methow, about five miles up from Ives' landing, on the Columbia. Squaw creek itself flows into the Methow on the west side. There are mines on both sides of the creek. The district extends for fifteen miles that is, it runs up to the divide in the direction of the Okanogan river.

NICKEL ORE.—Several months ago L. H. Bowman of Leavenworth, Washington, and associates shipped from Okanogan county a carload of nickel ore to St. Louis for smelter treatment at an expense of $360 for the car alone. It had all been packed out to the Great Northern railroad on the backs of men at considerable expense. When it reached St. Louis the first samples were treated, with a net result of $90 per ton. But just at that juncture the smelter became the object of litigation, was closed by orders of the court and the remainder of the carload of ore has remained unused and of benefit to nobody.

There is no other smelter in the United States where nickel ore has been successfully treated and there are only two others outside of this country, viz: one in Wales and one in Germany. Nickel ore has been found in the United States in limited quantities at Benton, Saline county, Arkansas; in Fremont county, Colorado; at Chester, Connecticut; at Dracut, Middlesex county, Massachusetts; at Cottonwood canyon, near Lovelock's station, in Nevada; on Piney mountain and upper Dad's creek in Douglass county, and near Rock Point in Jackson county, Oregon. But the most important deposit of nickel thus far discovered in this country is that of Lancaster Gap, in Pennsylvania. At first it was mined from 1852 to 1860 by the Gap Mining Company; the mines were closed down from the latter date until 1862, when they were purchased by Joseph Wharton of Philadelphia and reopened the next year. Within a few years the output at Lancaster Gap has been declining because of the gradually decreasing quantity of ore. It is to be hoped the Washington ore may be produced in quantities sufficient to supply the American demand, and if so the facilities for smelting will not long be the only obstacle to production.

## BRITISH COLUMBIA.

QUESNELLE RIVER.—*Journal:* The Quesnelle River Hydraulic Gold Mining Company will resume operations, with Mr. James Deacon of Quesnelle as foreman, in the early spring. With a permanent water supply, this company has a valuable property. More work will have to be done to secure a good supply of water. A four-mile ditch will add largely to the supply and a permanent dam at Big Lake will give a good supply to draw on for the latter part of the season. The mines are situated about 13 miles above the mouth of the Quesnelle, on the north bank, and the company's ground consists of 320 acres, with a lease of 160 acres more four miles farther up the river. Messrs. J. B. McLaren and Albert Palmer are the principal owners.

THE HORSEFLY.—Ashcroft *Journal:* Six additional cars of pipe for the Horsefly Hydraulic Gold Mining Company have arrived at Ashcroft from San Francisco during the past week, and the railroad employes state that all the pipe has arrived. The amount is about 275,000 pounds. A great deal of the pipe has been forwarded and is strung out on the Cariboo road from Ashcroft to the 150-Mile House. A considerable amount was started up the road in December and unloaded at the hills and hard places, and when a load would be started subsequently it was taken on as far as possible, much of it being served as the previous loads had been—unloaded when necessity required.

The pipe is of heavy sheet iron, similar to that used at the Horsefly and Cariboo mines. Where laid it will be pitched on both sides, a plan that renders it impervious to rust.

TRAIL CREEK SMELTER.—Last Saturday the Trail smelter blew in its water jacket blast furnace for the first time. The buildings consist of the main matte and power building 310 feet long, 60 feet wide and 62 feet high; the O'Hara building, 180 feet long by 70 feet wide by about 60 feet in height, the sampling mill, ore bins, and offices, etc. In the main building are two reverberatory furnaces, nearly completed, with four roasters above each, the blast furnace and an 80-horse power boiler and engine. Two more reverberatory furnaces have be begun, which will, like the others, have four roasters also on top of each of them. The plant will have a daily capacity of 300 tons.

## UTAH.

At Mercur Messrs. Scheu, Thompson and McFarland have bought from the Viking Mining Co. the Hillsdale group of mines for $25,000, cash.

COMPOSITION OF GILSONITE.—In reporting the results of an investigation of Utah gilsonite, says *Paving and Municipal Engineering* Dr. William C. Day, after discussing analysis of varieties of asphalt by Boussingault and Kayser, remarks that although there are in print many articles of value on the commercial applications of asphalt, and some giving the results of elementary analysis, he has failed to find any, other than by the two persons mentioned, and one by Peckham, which throw light upon the real nature of asphalts or which definitely describe the products obtained from them.

His investigation of gilsonite, a variety of asphalt, had for its object the isolation of such single hydrocarbons, or classes of hydrocarbons or their derivatives, as would give some information as to the nature of the material itself. Although the object has not been fully obtained, sufficient progress has been made to indicate that definite results are near at hand, but the work will be interrupted for a few months. At the conclusion of Dr. Day's analyses he found the percentage composition of gilsonite to be as follows:

Carbon, 88.30 per cent; hydrogen, 9.96 per cent; sulphur, 1.32 per cent; ash, 0.10 per cent; oxygen and nitrogen (undetermined) 0.32 per cent.

## MONTANA.

Suit has been brought in the Federal Court in Butte in the name of the United States against several local real estate men to set aside a placer patent to a large piece of mining ground covered by the smelting plant of the Parrott Mining Company, which is the real defendant in the case. It is charged by the Government that the patent was irregularly and fraudulently issued under the supervision and direction of Land Commissioner Stone, who, it is alleged, was in collusion with the defendants. It is charged that the proofs on which the patent was obtained consisted mostly of forged and fraudulent affidavits.

SOME BUTTE PRODUCERS.—The report of the Montana Ore Purchasing Company for '95 gives full details of the Glengarry and Rarus mines. The yield of ore at the former was 44,019 tons and at the Rarus 26,185 tons. The gross value of the ore obtained from both mines was $13.59 per ton and the cost of extracting the ore is given at $3.12 per ton, the total cost for extracting the ore being $219,036.48. The cost of transporting the ore from the mines to the smelter was 35 cents per ton, the total cost of transportation amounting to $24,571. The cost of reducing the ore was $8.97 per ton, the total cost of reduction amounting to $629,729.88. The amount expended for labor is given at $455,270.97 and the cost of supplies $418,066.79.

The Boston & Montana Company gives the net proceeds of the Mountain View, Pennsylvania, Leonard and West Colusa at $835,006.07.

The Butte & Boston's report of ore extracted during the year is as follows: Silver Bow No. 1 and No. 2, 120,000 tons; East Gray Rock, 61,170 tons; Blue Jay, 9660 tons. The custom ore purchased by the company during the same period amounted to 13,380 tons. The sum of $950,450 was expended for labor, and the cost of supplies is given at $700,550. No net proceeds are given.

The Parrot Company extracted 75,000 tons of ore at a total cost of $223,438.31, or nearly $3 per ton, and the total cost of reduction amounted to $704,864.25. The net proceeds are given at $163,581.56.

The production of ore at the Colusa-Parrot, owned by W. A. and J. R. Clark, was 33,670 tons of the gross value of $8.80 per ton. The cost of mining is given at $2.65 per ton, the cost of transportation 50 cents per ton and the cost of reduction $6 per ton. The expenses for labor are given at $57,511 and the cost of supplies $31,551.

At the Stewart the production was 4750 tons of the gross value of $13.50 per ton, which was mined and reduced at a cost of $9.90 per ton; transportation cost 60 cents per ton. The expenses for labor were $30,650 and the cost of supplies $16,350.

The Moulton produced 1000 tons of ore of the gross value of $15.60 per ton at a cost of $8 per ton, and the total cost of transportation is given at $7000. The company claims it operated during the preceding year at a loss of $12,000.

THE ANACONDA'S NEW REFINERY.—The Anaconda Company's new refinery is in operation. It cost $250,000 and has a daily capacity of 240,000 pounds of refined copper, 15,000 ounces of silver and 60 ounces of gold—$40,000. The blister copper, the unrefined product, shipped abroad represents nearly as much more. The Anaconda Company produces fifty-two per cent of the American copper production. The American product amounts to two-thirds of the world's output, so that this company produces more than one-third of the total production of the world. The new structure is 250 feet square, all under one roof, and contains 600 electrolytic tanks and all their appliances. The silver mill has also received a recent extension. As a by-product, the company turns out about as much silver as any silver mine in the country.

AROUND GREAT FALLS.—The Boston & Montana smelter had 900 men employed last month, with a payroll of $60,000. The United Smelting & Refining Co. paid out $15,000. At Belt, twenty-five miles from the city, the mines owned by the Anaconda Co. paid out $75,000, and the Sand Coulee mines $40,000. This company is shipping 145 cars of coal and six cars of coke to Butte daily. It is operating 100 coke ovens and running night and day, and is unable to extract coal enough for its own use and is taking a number of cars from the Sand Coulee mines. The Montana Central railway is running fourteen trains a day from Great Falls to Butte.

## NEW MEXICO.

T. H. Lothian of the Lone Star mine, Cochiti, has arranged for the erection of a mill of large capacity at Bland. The process adopted is the invention of Mr. Schroeder of Denver. There are about 800 feet of shafts and drifts. The ore in the sixty-foot shaft on the property averages $10 in gold.

## COLORADO.

W. S. Stratton, of whom so many wonderful tales are afloat, is reported in a Denver newspaper as saying: "All this talk about my not being able to take care and keep account of my money in the bank, which is supposed to be accumulating so fast, is all bosh. I have no great income. At present I am shipping little or no ore from the John A. Logan, American Eagle or Lottie, and the wonder-

fully rich ore in the Independence has been passed through and a large body of lower grade sulphide ore encountered, but I am not shipping much from the Independence or the Portland No. 2, which is directly above it and connected with it."

### WYOMING.

A Rawlins dispatch says the Timberlake placers in the Four Mile district are being investigated by a syndicate of Des Moines, Chicago and New York parties, with a view to their purchase. They spent three days looking over the property, which embraces about 4000 acres of rich gravel. Tests were made in numerous places on the property with the pan, the results showing values running from 50 cents to $2 a yard. The sale of the property will mean the expenditure of from $150,000 to $200,000 in building a ditch to put water on the property. The parties returned to Omaha on Wednesday, where they will meet the other members of the syndicate and decide upon the question of purchase.

### MICHIGAN.

COPPER COMPANIES.

THE CALUMET & HECLA CO. — Some of the ground north of No. 5 shaft is showing a large amount of rock which, according to reliable information, will yield at least 20 per cent of ingot copper, which is said to equal anything ever found in the mine. The shares of this company have advanced to $300.

The Quincy Mining Co. in 1895 produced 19,732,970 pounds of mineral, yielding (about) 16,250,000 pounds of refined copper, against 15,484,014 pounds of refined copper in 1894. The Quincy pays a dividend of $4 per share on the 17th, which makes the total dividends declared by this company since its organization $7,870,000.

THE BOSTON & MONTANA CO. — This company's production of copper for 1895 amounted to 50,000,000 pounds. They have so far reduced the cost as to be able to lay down copper at New York at 5.27 cents per pound. The argentiferous character of the ore, containing gold as well as silver, is a factor of great importance in keeping down the cost of the copper product to this remarkably low level.

The Boston & Montana has declared a dividend of $2 per share, payable February 20th. It is understood that this is the beginning of regular quarterly dividends of a like amount. As the indications are for higher, rather than lower, prices for copper this year, the ability to pay at least $8 per share annually is unquestioned. This would be equal to about 10½ per cent per annum with the market value of the shares at $76. The bonded indebtedness stands now at somewhat less than $1,000,000. It is believed that the new improvements at the Great Falls works will give the Boston & Montana a capacity of about 5,000,000 pounds per month, if conditions warranted such an output. A production of this amount would be pretty close to that of the Rio Tinto, the greatest copper mine in Europe. The Rio Tinto Co. brings to market annually about 31,000 tons of copper. According to its last report it had a bonded indebtedness of £3,600,000, bearing interest at the rate of 4 per cent. Dividends were declared of 4s per share in April, and 10s per share in October, 1895, or a total of 14s. Rio Tinto shares about five or six weeks ago were at the equivalent of some $70, but had risen to about $89 a few days ago. Taking the latter figure as the present market value of Rio Tinto, annual dividends of 14s per share would bring the investor a return of only 4 per cent as compared with 10½ per cent by the Boston & Montana. On the foregoing basis of cost and production the Boston & Montana would be able to fully earn $8 a share per annum on the altogether improbable contingency of an 8-cent market for copper.

Tharsis Sulphur & Copper Co. informs Houston & Co. that their production for 1895 is about 10,000 tons of fine copper. The company's last dividend was 4 shillings per share, payable in May, 1895, and covered a period of twelve months' operation, equal to about four per cent on the market value of the shares. Since 1866 the Tharsis Co. has paid in dividends £5,258,432.

The Cape Copper Co., Limited, produced in 1895 of fine copper 5350 tons, against 5300 tons in 1894.

The production of John Stanton's group of Lake Superior mines for 1895 was as follows, in refined copper, viz.:

| | *Pounds.* |
|---|---|
| Wolverine | 1,815,391 |
| Atlantic | 4,832,497 |
| Central | 397,020 |

The Franklin Mining Co. did not produce any copper in December, owing to the destruction by fire of the hoisting engine. The total production for 1895 was 3,086,933 pounds of refined copper.

LAKE SUPERIOR COPPER MINES.—(Special Correspondence).—The January product of the Lake Superior copper mines is as follows: Atlantic, 257 tons 35 pounds; Wolverine, 101 tons 165 pounds; Quincy, approximately. The Franklin was closed down in January on account of fire having destroyed the engine and boiler plant.

The Tamarack, Osceola, Tamarack Jr. and Kearsarge mines do not give out their monthly products for publication, but from a semi-official source we give the January product of the Tamarack as 1050 tons, Osceola 300 tons, Kearsarge 100 tons of mineral copper.

The Calumet & Hecla is not crowding its product since the new year. Its product cannot be given approximately correct, as the mine management use great caution to prevent it being known.

The Calumet & Hecla is having considerable trouble with its No. 6 shaft, as the hanging wall is caving in on the miners. Recently a number of miners and drill boys were imprisoned for several hours under rock and timber. The framed and mortised timber which this mine only is using has to be abandoned and the largest pine timber that the forest affords is being put in, but it cannot hold the immense weight of rock that crowds it.

The action of Judge Hubbell in the case of the widow of Fred Shoepper vs. the Hancock Chemical Company of Woodside for a damage of $30,000 for the killing of her husband by an explosion of nitro-glycerine, was a surprise to the members of the bar and particularly the plaintiff's attorneys, who had taken the case on an agreement to receive a certain per cent of the amount recovered. The Court ordered the jury to find a verdict for the defendants on the ground of insufficient testimony. The plaintiffs will appeal to the Supreme Court for a new trial. A. F. ISLER.

Houghton, Mich., Feb. 4, '96.

### MINNESOTA.

A PRIMITIVE STAMP MILL.—Rainy Lake *Journal*: It has been thought that the heart of this gold belt lies between Rainy lake and Wild Potato lake, along Seine river, but new and valuable discoveries have been made farther up the river and north as far as Little Turtle lake. The latter place, from all accounts, promises to prove the wonder of the range. The parties owning one rich property there are at work grinding quartz with a contrivance made of such pieces of wood as could be hewn from timber and such scraps of iron as could be secured without expense, all of which did not cost to exceed $10. The "mill," as it is termed, is nothing more nor less than three "dollies," enclosed and housed in a log building. Each "dolly" consists of a long, heavy spring-pole, fastened outside of the building, hung on a swivel. Inside the building, at the end of the pole, is hung a log, in a vertical position, at the end of which is attached a worn-out stamp-mill shoe, or other heavy scrap iron. A hole is bored through the stamp-log and a pole inserted for a handle. The operator grasps the handles, and, by bearing down, forces the heavy "stamp" down upon the quartz beneath upon the solid rock floor, the spring-pole then making quick, heavy blows, with a little effort, which soon reduces the quartz to dust, when the gold is panned and saved in the ordinary manner. The three stamps crush about 500 pounds a day, and, as the ore is assorted and yields from $60 to $90 a ton, the three men are making more than five times the ordinary wages. The success attending the efforts of these men should induce others to go at work in a similar way, and by so doing they can laugh at the present apathy of capital with regard to these new gold fields.

### ARIZONA.

SMALL-POX AT CONGRESS. — Because of a small-pox epidemic the following is posted at Congress station. All persons are forbidden to leave Congress mines or its immediate vicinity, or from boarding, or attempting to board any trains passing Congress station, or to purchase a ticket at said station, without a written certificate from Dr. J. Miller. By order of the Board of Supervisors of Yavapai County, Territory of Arizona.

THE TUCSON SMELTER.—The Tucson smelter this week resumed operations with a force of thirty-five men, working eight hour shifts. Returns from New York on bullion heretofore shipped to that point, shows it yielded a high percentage of pure copper, and copper matte.

Yuma *Sentinel*: Last Monday the La Fortuna mines, that were bonded on the 3d of last July to C. D. Lane, passed out of the hands of the original locators and a deed on that day was filed by Supt. R. M. Straus with County Recorder M. L. Pool, which conveyed all right and title in said mines to Mr. Lane, and the consideration therein expressed is $150,000.

This is one of the largest amounts ever paid for a partially developed mine in this county.

The mine is located 28 miles southwest of this city, in the San Alvino mountains, and the fortunate locators are Messrs. Farrell, Halbert, Albert and Thomas.

The above-named gentlemen located the mine a little over a year ago. They were all poor prospectors and had a hard time to get the necessaries of life until R. M. Straus came along and was successful in getting Mr. Lane to take hold of the prospect and put a large number of men developing the property.

Since that time a shaft has been run down over 200 feet and crosscuts made, which at the present stage of development shows more rich gold ore in sight than has been paid for the mine. The ore is free milling and the richest ever seen hereabouts, averaging from $50 to $300 per ton in gold.

It is the opinion of mining experts who have visited the mines that it will prove one of the richest mines ever discovered in the Territory.

THE OLD VULTURE MINE.—The old Vulture mine that in the past added millions to the gold circulation is again assuming prominence. The old mine for all its millions, never was worked much lower than 400 feet in depth. There the ore commenced to run into sulphurets, and the scheme of the workings above was not such as would warrant a continuation of the procedure at a greater depth. Then the pipe line from the Hassayampa was swept away in the Walnut Grove flood and the mine closed down. This valuable old property has been leased by Mr. Kempton. Of the Vulture mine and surroundings the *Republican* says: "Ten of the hundred stamps of the old mill are at work on ore taken from the old workings, and they are running the batteries by a 25-horse power Westinghouse engine. Water for steam is secured from the bottom of the inclines while the drinking water is condensed. The nearest surface water is in the Hassayampa, over the hills fifteen miles distant. The works are the relics of what was once the largest plant in the southwest. Many appliances are there that render Vulture a complete though little camp, and when the connecting rod of the high-speed engine broke a few days ago there were appliances at hand in the machine shop whereby a new rod was neatly constructed within a few days."

### MEXICO.

SONORA.—At El Plomo, in the Altar district, the National Mexican Development & Mining Co., under the management of George E. Bent, is pushing work. It has twelve teams hauling freight from Santa Ana. The machinery for a sixty-ton concentrating plant has passed the custom house at Nogales en route. Underground there are already 8000 feet of development work on the three properties owned by the company, and new work is being prosecuted with vigor. A tunnel 350 feet long will be run through the hill on the Johnson property, and work of driving it has commenced from both ends. Mr. Bent is now working some forty Mexicans and fifteen Americans.

### NEWFOUNDLAND.

It is said that asbestos mining is likely to become an important industry of Newfoundland in the near future. Next year, says the *Canadian Colliery Guardian*, will witness an active development of these deposits, regarding which there are sanguine expectations. It is reported that gold-bearing quartz has been discovered at Ferryland, south of St. John's.

### SOUTH AFRICA.

A SLIMES PLANT.—Johannesburg *Mining Journal*: The slimes plant at the Crown Reef is now nearly ready; it comprises six circular iron vats, 32 feet in diameter and 10 feet deep, the concrete floor sloping from the circumference to the center. This set of vats is just above the cyanide shed, and a few feet lower are two 20-foot receiving vats for the solutions from the leaching vats, prior to passing to the precipitation boxes. Below the shed is the big solution tank, 40 feet in diameter and with a capacity of about 70,000 gallons. The quantity of solution will of course be very large, and the precipitation boxes are to be six in number, built of brick, and arranged, as is desirable in the case of weak solutions, for the electrical precipitation process, with sheets of iron and lead. Their dimensions are: length, 30 feet by a width of 4½ feet, and a depth of 11 feet. The complete pulp-treatment plant will now comprise the classifiers, with five concentrate vats, the treatment of sands and the treatment of the slimes. The concentrates are received in two vats for a first treatment and then are transferred to the other three vats for the remainder of the process. The sand treatment remains as usual, but the overflow from the vats is to pass a series of serrated separators, from the bottom of which further sands will be obtained and removed by trucks. From these separators the overflow passes on by launder, in which a precipitating lime-solution will mingle with the slimes, to a series of three separators, the two upper ones being 20 feet in diameter, top section, and the lower one 40 feet in section. The slimes, settled here by the lime, will be pumped as a sludge to the six leaching vats already mentioned. These vats will be one-quarter filled with sludge, when the cyanide solution, a very weak one, will be introduced by vertical pipe in such a manner as to impart a circular stirring motion to the sludge. A contact of a few minutes in this soup-like mixture will dissolve the gold, when the sludge being again precipitated, the gold-charged solution will be drawn off at different levels by a series of exits down the side of the vat. It is calculated that about 80 per cent of the solution will be drawn off, bearing that proportion of the gold; and, if the further proceeding should be found payable, by introducing water and again drawing off, a further 10 per cent of the gold may be brought away. The plant is arranged to treat about 180 tons of slimes a day.

### VENEZUELA.

A returned miner says: "The methods of miners are absolutely crude. The mining parties are composed of negroes with a white man at the head. Each miner carries a shovel, a pick and a crowbar. He also carries a machete or long heavy knife for cutting his way through the underbrush which springs from the moist earth in every direction. There are no roads, and every man cuts his own road when he travels. The parties travel up stream in a boat, usually a crude dugout, and there may be a great number of the boats afloat at the same time. Arriving at the placer ground little time is lost in building houses, as a shelter overhead is all that is needed in that country. The negroes are hired with the understanding that they are to receive half the gold they find. The negroes scatter through the forest, each man selecting a spot which he clears of underbrush by the aid of his machete. He then digs a hole in the soft ground. The hole begins to fill with water and the negro is soon hard at work panning by means of a wooden 'batea.' He pans the dirt as long as it yields $10 to $12 a day, and when it drops below that amount the pay streak is said to be exhausted, and the miner moves on to a new spot. I have seen holes in the ground ten feet deep, but they are generally quite shallow. The placer gold belt is 300 to 500 miles long and of unknown width."

## Coast Industrial Notes.

—The Los Angeles oil yield is reported to be falling off.

—The advance in wheat has checked the export flour trade with China.

—The annual value of San Francisco manufactures is estimated at $82,743,000.

—The Tubbs Cordage Co. has resumed operations at the Potrero rope walk, employing about 100 operatives.

—At Guaymas a schooner from Oregon has discharged 500,000 feet of lumber for the Creston Mining Co. at Minas Prietas.

—At the Potrero, this city, the sugar refinery now employs about 700 hands. At the rolling mills 500 men have present employment.

—Twenty-five years ago, next Saturday, the corner stone of the "new city hall" in this city was laid. To date it has cost nearly $5,000,000 and is not completed.

—The question of a dredger for the Fraser is under consideration by the board of trade of Westminster, B. C. An appeal will be made to the dominion government.

—During January the collections of inland revenue for the Victoria, B. C., division totalled $13,491.01, as contrasted with $10,586.68 for the corresponding month of '95.

—California sends the most of its exported barley to England; but, in '95, 300,000 bushels went to Honolulu. Barley exportation is comparatively new to this State. Two years ago 2,000,000 bushels were imported.

—The Mexican federal census, just completed, shows a population of 12,542,057. The City of Mexico has 339,905; Guadalajara, 83,870; Puebla, 91,917; San Luis Potosi, 69,676; Pachuca, 52,819; Monterey, 56,835; Merida, 56,702; Zacatecas, 40,026; Durango, 42,106.

—Revenue Cutter No. 3 for service on the Pacific Coast will be completed Jan. 15, '97 and delivered to the Government at Philadephia by Cramp & Sons of that city. Their bid was $198,000. The Union Iron works of this city offered to build it on modified specifications and deliver it here, where it is to be used for $199,000, but as in the case of another vessel, the Atlantic builders secured the work.

—California annually sends away a great deal of money for products that could be supplied at home. Take, for instance, Pacific coast codfish—not the cheap Massachusetts imitation codfish sent here and largely consumed, but genuine codfish, all wool and nearly a yard wide. Were San Francisco jobbers to carry that and discard the imitation product, or, rather, could they induce the retailer and consumer to call for Pacific coast codfish, it would keep money in the State now sent away for an inferior article. This is only a drop in the bucket, but is cited as worth passing notice.

—"A chain of compressed cakes of gun-cotton tied around the trunk of the largest size trees and exploded, will, by the action of its violence, cut the tree down instantly as smoothly as if it were done by an ax in the hands of an expert woodsman. Timber cutters working the forest giants of Montana, Idaho and Washington declare it to be the cheapest and most economical mode of felling trees that has yet been devised." The above is clipped from a Colorado paper and may be so. If any of our readers in the region referred to have personal or practical knowledge of the alleged "mode of felling trees" it would make interesting reading.

—The tin deposits of California are not being worked. Stream tin has been found in the bed of the Feather river, and float tin has been discovered in Hungry creek, and in loose soil near Weaverville. Native crystalline tin was found in gold mining in Tuolumne county. The only deposits yet discovered which seem to have any value are in the Temescal mountains, 55 miles east of Los Angeles. A mine was worked there for two or three years by the San Jacinto Estate, Limited, but operations were discontinued some time since, and there seems to be no prospect of work being resumed. All told, less than 300,000 pounds of tin were produced from the workings.

—The northern transcontinental lines have revised their west-bound freight tariffs to Portland, Or., and Puget sound from the central traffic association territory, Chicago and common points and Mississippi river common points to meet the rates made by the southern lines in connection with the steamship service from San Francisco. The rates of the northern lines to Portland and Puget sound points are now equal to the southern rates to San Francisco, plus the local rate from San Francisco to destination. The new tariff goes into effect next Saturday, the rates on northern lines will be reduced to a basis which is practically five cents above the rates applying from these territories to San Francisco via southern lines.

—The first annual report of the Manufacturers' and Producers' Association is received. On March 19, '95, there were practically 40 members; the association has a present membership of 1310, representing 272 branches of industry in 89 cities and towns of the State, with a rating at Davis' Commercial Agency of $82,900,000. The association members employ about 52,500 persons. Considerable work has been done during the year at a very small cost, the funds being economically spent. The total receipts of the year were $7252.17; total expenses, $6951.03. H. T. Scott is president, L. R. Mead secretary. The officers have all worked hard for the general advancement of all the interests of the association and deserve commendation. The report is printed from type with ink and paper made in California. The association has secured a suitable site on Twelfth street, been Market and Mission, in this city, having a street frontage of 200 feet, with a depth of 475 feet, on which it is proposed to erect a pavilion and suitable buildings in which to hold an exposition.

## Personal.

HENRY F. MYERS, representing the Playa de Oro Mining Co., is visiting the city and State.

MESSIEURS REYNAVD LAEROZE and M. Pierredor, of Paris, are looking at mining properties at Grass Valley, Cal.

CAPT. THOS. MEIN is urged by resident California miners in South Africa for the position of U. S. consul at Johannesburg.

CHAS. C. DERBY, former surveyor at the New Almaden quicksilver mine, is the new manager of that extensive property, vice Capt. Harry, recently deceased.

GEO. H. ROBINSON, manager of Capt. De La Mar's Utah and Idaho mining properties, has been elected president of the East Golden Gate Mining Co., at Salt Lake City, Utah.

W. C. BUTLER, the general manager of the Puget Sound Reduction Works, Everett, Wash., has received instructions to proceed promptly with the construction of the bullion refinery.

H. S. SHERARD, formerly of the Grand Victory mine, Placer Co., has had bonded the New Year, in the Judith mountains, in Fergus county, Montana, together with some adjoining claims, for $100,000, to New York capitalists. The bond is for one year. The first payment, $25,000, is to be made May 1, 1896; the second, $25,000, September 1, 1896; and the third, $50,000, January 1, 1897. There shall be deposited in the Bank of Fergus county, before work commences, a forfeit of $5000.

JAS. H. TIBBITS writes from Buluwayo, Matabeleland, South Africa, under date of Jan. 9th, that transportation there is very high. He paid $50 to have his trunk carried on the coach. Freight from Mafeking to Buluwayo is $100 per ton. The freight on a 20-stamp quartz mill amounts to $27,000—a sufficient sum to build a good mill in California. No mills have yet been erected, but there are three 20-stamp mills on the road. There are 560 bullock wagons on the road and it requires three months' time to make a round-trip.

## Commercial Paragraphs.

THE contract for the ten stamp combination mill to be erected on the April Fool mine at De Lamar, Nev., has been awarded to the Colorado Iron Works after some spirited competition between Salt Lake agents.

THAT the product of the Westinghouse Electric and Manufacturing Company is of world-wide demand has again been demonstrated recently by the company receiving orders to equip an electric railway in the "Isle of Man," the little island near the coast of Ireland, which has been made famous by Hall Caine, the great novelist; another order for electric railway apparatus for the city of Coventry, England; and a third order for electric motors and railway generators for Cape Town, South Africa. The company is also about to ship an order for electric railway apparatus to Bangkok, Siam, India.

JAS. S. BROWNELL, Western agent of the Frue Vanning Machine Company, this city, reports recent sales as follows: Esperanza Mill, Mokelumne Hill, Cal., 6-foot plain belt Frue Vanners; Jackson & Lakeview Mining Company, Lundy, Cal., one 4-foot patent lip flange belt Frue Vanner; Hector Mill, Sutter Creek Cal., sixteen 4-foot patent lip flange belt Frue Vanners; C. C. May, Davenport, Wash., four 4-foot patent lip flange belt Frue Vanners; J. H. Huffer, Jacksonville, Ore., one 4-foot patent lip flange belt Frue Vanner; W. Y. O. D. Mine, Grass Valley, four 4-foot patent lip flange belt Frue Vanners.

## Recent Mining Incorporations.

THE Golden Fissure Mining Company has incorporated in Oakland with a capital stock of $96,000, of which $100 has been subscribed by the following: G. H. White, J. C. Young, I. S. Watson, J. H. Aydelotte, O. E. Hitchcock, E. R. Shaw, H. B. Pinney, W. Wiand and J. A. Pouser.

THE Iron Mountain Investment Company, with a capital stock of $50,000, all of which has been subscribed. The Mountain Mines, Limited, subscribed $47,500. The company will acquire and manage water rights and ditches in Shasta county. Incorporators—L. B. Parrott, Alexander Hill, Clay W. Taylor, C. P. Eels, M. F. Michael.

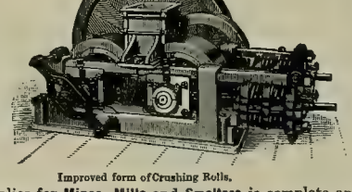
The Golden Crown Mining and Milling Company of Los Angeles, Cal.; principal place of business, Los Angeles; capital stock, $10,000,000, with $500 subscribed; George G. Mullins, W. V. Hedges, C. L. Hedges, Ben Goodrich and Thomas S. Fuller of Los Angeles, directors.

This doesn't happen every day. You can't expect it more than a few times in a lifetime. No one is going to agree and guarantee positively to save you 30 per cent or else no pay unless they know what they are about. You can't expect people to say, "You need not pay for this until you have proved our guarantee," unless they intend to do all that they claim. As a matter of fact, we do more than we claim. We guarantee to save 30 per cent, but actually we save a good deal more.

Have you ever heard of a Double Pipe Air Compressor? It has one disadvantage. It needs twice as much piping as is needed with the ordinary makes of Air Compressors. On the other hand, it has more real, genuine advantages than you can shake a stick at. It will do the same work as the ordinary Air Compressors, such as are in general use throughout the mines on this coast, on 30 per cent less power. We will guarantee this and prove it to your satisfaction, else you need not pay for the Compressor. It weighs less than half as much as the ordinary Air Compressor. It costs less for freights and is more easily carried up into the hills. It shows the same high efficiency at all altitudes, high or low. It takes no more fuel to do the work if located on the highest peak of the Sierras than it would take if located at the sea level. It enables you to buy a smaller boiler than you can use with any other Air Compressor to do your work. It does not overheat the air at the Compressor and freeze it at the rock drill. In short, it is the ideal Air Compressor. It has been tried in practice, and we can show you the highest recommendations and endorsements. We sell it on a strict, positive, iron-clad guarantee If your power costs you anything, you want the Double Pipe Air Compressor, because you can buy it on a guarantee that it will run on 30 per cent less power than any other make of Compressor. If you have to take a Compressor to your mine over bad roads, you want the Double Pipe Air Compressor, because it weighs less than half as much as any other Compressor. It is cheapest to buy, cheapest to run, cheapest to transport, cheapest to carry anywheres. For pumping it beats the world. You can run it with steam or water.

Write to the Pneumatic Power Co. for further information. If you are in the city and want a compressor, call and see them. They will show you the Double Pipe Air Compressor in operation. Remember you run no risk. We claim wonders, but we have to perform wonders in Air Compression, or else you don't have to pay for the machine. We are ready. Are you?

Pneumatic Power Co., 306 Pine St., Room 10, San Francisco, Cal.



ESTABLISHED 1860. **COLORADO IRON WORKS** INCORPORATED 1876.

MANUFACTURERS AND BUILDERS OF

**Smelting Plants of All Kinds, Concentration, Cyanide and Chlorination Plants.**

Stamp Mills, Cornish Rolls, Roasting Furnaces, Hydraulic Sizers, Etc.

WESTERN AGENTS FOR ERIE CITY IRON WORKS ENGINES AND BOILERS.

Improved form of Crushing Rolls.

Crushers, Sampling Mills, Screens and Elevators, Sample Grinders, Etc.

WESTERN AGENTS FOR SMITH-VAILE STEAM PUMPS For all kinds of service.

Our stock of supplies for Mines, Mills and Smelters is complete and we are prepared to fill orders on shortest possible notice.

We have an ore testing plant in connection with our works and we test ore in car lots for concentration and amalgamation, and build mills to successfully treat all classes of ores by latest known methods.

OFFICE AND WORKS, 33D AND WYNKOOP STS., DENVER, COLO.

**RUPTURE CURED.**

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absolutely without danger. Usually but a single treatment required.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR WEEK ENDING FEBRUARY 4, 1896.

553,954.—SHEEP SHEARS—S. L. Cohoon, S. F.
554,174.—OVERSHOE RETAINER—F. F. Foster, Snohomish, Wash.
554,023.—POWER WHEEL—G. S. Fouts, San Jose, Cal.
553,950.—LAMP—J. Gregory, Seattle, Wash.
554,062.—CONVERTING MOTION—E. W. Hammon, Davisville, Cal.
554,183.—PLASTER—T. W. Heinemann, Los Angeles, Cal.
554,027.—CAN MACHINE—A. Johnson, Oakland, Cal.
554,069.—STRAP MACHINE—Leibe & Vanderpool, Napa, Cal.
553,936.—GANG PLOW—A. J. Malsbary, Reedley, Cal.
554,073.—ENGINE—Miller & Collins, Vacaville, Cal.
554,082.—MINING PUMP—W. Nance, Grass Valley, Cal.
554,077.—FRUIT SPLITTER—S. H. Shelley, Berryessa, Cal.
25,114.—BUTTON DESIGN—J. M. Litchfield, S. F.
25,115.—BUTTON DESIGN—J. M. Litchfield, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SEED RACK.—James Sproule, San Francisco, Cal. No. 553,571. Dated Jan. 28, 1896. This is a rack which is especially adapted for containing packages of seeds. It is composed of a series of superposed troughs having end or side pieces which are supported at an inclination so that said troughs form a series of receding terraces from the bottom to the top, open transverse arches spaced or separated from each other and fixed to the upper surfaces of the troughs, and rods extending parallel with the troughs along the front and backs of the tops of the transverse open arches. The object of the device is to so dispose of the packages which it contains as to render them convenient of access and inspection.

ENGINE.—Edwin W. Hammon, Davisville, Cal. No. 553,613. Dated Jan. 28, 1896. This engine belongs to the class of reciprocating engines which, on account of the shape of the cylinder, are known as "sector-shaped" engines. The invention consists principally in the improved means for mounting and packing the shaft, and the object of the invention is to provide such a shape in cross section of the sector cylinder as will adapt it for the best and most effective packing off the shaft and piston, and also to provide for the necessary clearance at the ends of the cylinder.

AMALGAMATOR.—Samuel A. West, San Francisco, Cal., assignor of one-half to Wm. H. H. Hart of same place. No. 558,634. Dated Jan. 28, 1896. This amalgamator belongs to that class in which a vertical series of amalgamating surfaces are arranged so as to successively discharge the material from one surface upon the other. The object of the invention is to provide a simple and effective amalgamator for use in both the wet and dry processes. The machine comprises a box, a series of oppositely inclined supports or shelves with the supports of each side terminating short of the opposite side to leave spaces from one shelf to the other on opposite sides successively, amalgamating plates extending over said supports or shelves and traversing the spaces, having the portion extended over the spaces foraminated, a hopper at one end of the box and a discharge at the opposite end.

LOW WATER ALARM.—Oscar J. Backus, San Francisco, Cal. No. 553,636. Dated Jan. 28, 1896. The object of this invention is to indicate and signal when the water in a steam boiler has become too low for safety. It consists of a vertically disposed casing connected at the upper and lower ends with the boiler above and below the water line, said casing having projecting from one of its sides the right-angled extension, with openings in it corresponding with the gauge cocks and a visible water gauge, an expansible bar secured at one end only to one of the inner walls of the vertical casing in line within the horizontal extension, its outer end sliding through a stuffing-box at the end of the casing so as to press against a lever which stands in line with it. This lever has a long arm, movable so as to make a contact between two electrodes whenever it is thus pushed by the expansion of the bar on account of too great a heat, and when this contact is formed an alarm will be sounded, which will attract the attention of any one near. Whenever the bar contracts, a spring moves the lever so as to separate the electrical contacts. The action depends upon the fact that as long as the bar is immersed in the water it will have a less temperature than when the water has sunk so as to expose it to the steam, and the higher temperature of the steam will expand the bar and lengthen it so as to operate the lever as above described.

DEVICE FOR CONVERTING MOTION.—Edwin W. Hammon, Davisville, Cal. No. 554,062. Dated Feb. 4, 1896. This invention relates to the general class of mechanisms for converting motion from one form to another, and its object is to convert an oscillatory into a continuous rotary motion in the same direction. It may be applied to any use to which it is adapted and is especially useful in connection with the oscillatory motion of a vibratory engine or such as is commonly known as "sector-shaped" engines whereby their motion is conveniently and economically converted into a continuous rotary motion, and is adapted to be readily reversed. The device consists essentially of a driving gear to which the oscillatory motion is initially imparted, independent pinions meshing at opposite sides of said gear and at right angles therewith, a driven shaft upon which said pinions are loosely mounted, and a means for alternately engaging and disengaging said pinions from the pinion-shaft.

FRUIT SPLITTING MACHINE.—Sivert H. Shelley, of Berryessa, Cal. No. 554,037. Dated Feb. 4, 1896. This invention relates to the class of machines for pitting or stoning fruit and especially to that sub-class particularly adapted for the handling of clingstone peaches in which the operation is performed by the complete splitting of both the flesh and pit of the peach. The machine comprises oppositely rotary cutters in the same plane and having their edges brought closely together, said cutters being mounted upon fixed bearings whereby they are held rigid with respect to one another and a suitable carrier for advancing the fruit to and between the cutters consisting of parallel opposing belts or ropes, square or angular in cross section with their sides tangential to the fruit surface whereby V-shaped grooves are formed in which the fruit rests.

MOMENTUM ENGINE.—James M. Miller and Wm. L. B. Collins, Vacaville, Cal. No. 554,073. Dated Feb. 4, 1896. This invention relates to an apparatus for applying the power of water under high pressure and momentum. The object is to provide an apparatus in which a column of water is impelled by the action of a jet of steam under high pressure, and by the pressure of air which it compresses into an air chamber to apply it to the buckets on the periphery of a wheel so as to rotate the latter. It consists of a momentum wheel, an injector having a pipe connecting with a steam boiler, an inlet pipe connecting it with a source of water supply whereby a body of water is discharged through the injector by the velocity of the escaping steam, an intermediate condenser through which the jet of steam and water are discharged and a discharge nozzle surrounded by a body of fluid and connecting with the condenser and delivering the water upon the wheel.

**Just Ready.**

*New and Enlarged Edition.*

**THE PROSPECTOR'S FIELD BOOK AND GUIDE:**

IN THE

**Search for and Easy Determination of Ores and Other Useful Minerals.**

By Prof. H. S. Orborn, L. L. D. Illustrated by 47 engravings. Second edition revised, with a Glossary of Terms and other Important Additions. 12 mo., cloth. 236 pages. Price.....**$1.50**

*Sent by mail, free of postage, to any address.*

CONTENTS.—Chapter I. Preparatory Instruction. II. Crystallography. III. Surveying. IV. Analyses of Ores—Wet Method. V. Special Mineralogy—Gold. VI. Platinum, etc.—Silver. VII. Copper, and How Measured in Ores. VIII. Lead and Tin. IX. Zinc—Iron. X. Mercury. Bismuth. Nickel, Cobalt and Cadmium. XI. Aluminum, Antimony, Manganese, and other Minerals. XII. Petroleum, Ozocerite, Asphalt, Peat. XIII. Precious Stones. Appendix. Weights and Measures; Glossary of Terms Used in Connection, with Prospecting, Mining, Mineralogy, Geology, etc. Index.

*By the Same Author.*

# The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

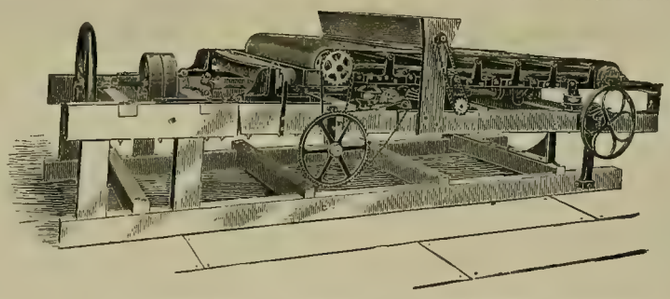
Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.

NINETY-FOUR AND ONE-HALF PER CENT

—SAVED—

ON ORES DIFFICULT TO CONCENTRATE.



A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH

Including prepared canvas belt 4 ft. 6 ins. wide.

FALES MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,

E. L. BALLOU, Propr. Ballou Reduction Works.

NOTICE TO GOLD MINERS!

## SILVER-PLATED AMALGAMATED PLATES

For Saving Gold

IN QUARTZ, GRAVEL OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER.

AT REDUCED PRICES.

The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

# Market Reports.

## The Markets.

SAN FRANCISCO, Feb. 13, 1896.

There is a general advance to note this week.

The Wire Nail Manufacturers' Association has addressed a circular to the jobbing trade, giving notice of another advance in prices of 15 cents per cwt. This will change the base rate from $2.25 to $2.40 per cwt., which is the highest price asked for wire nails in many years. Only a year or so ago the base price was 85 cents.

Wire nails were worth $2.10 per keg on January 1, 1892. By reducing the tariff the price got up to $2.53 per keg on January 1, 1896. With absolute free trade we may reach the old ante-bellum price of 17 cents a pound for wire nails.

According to Messrs. James Lewis & Son, of Liverpool, English and French consumption of copper for the year 1895 amounted to 93,350 tons, against 88,209 tons for 1894, an increase of 5,141 tons.

The United States production for 1895 was the largest in the history of the copper industry, viz: 383,190,080 pounds.

Under date of the 3d, D. Houston & Co. of New York write: Exports of copper from the United States during January amounted to 8456 tons. European copper statistics show an increase in stocks per cable to-day of 210 tons, and in visible supply of 110 tons during the last half of January. Total visible supply February 1st, 46,140 tons. The London market for G. M. copper closed to-day at £43 17 6 spot, and £44 5 0 futures. Sales, 150 tons spot, and 450 tons futures. The market for copper here presents some irregular features, with Lake quoting 10½@10⅝ cents; electrolytic 9⅞@10 cents, and casting 9¾ cents.

### New York Metal Market.

## Mining Share Market.

SAN FRANCISCO, Feb. 13, 1896.

The north end shares sold down, with sales of Con. Virginia made at $1.95. On Monday afternoon the north ends strengthened slightly, but were weaker again Tuesday. Yesterday more strength was noted. The market still lacks the element of strength which would point to more active and much better figures. It wobbles too much, as if moneyed men were not giving it support, and in the absence of the latter no pronounced move need be looked for. Why they hold back is not difficult of seeing, and it lies in the lawsuits brought and the one still in court. All the suits brought have met defeat except the Hale & Norcross, and this will probably go the way of the others unless there is a miscarriage of justice. The defense in this case have made a strong showing, and well-informed lawyers and experienced and unbiased mining men think that the plaintiffs have lost their case. If this should prove to be the case, then it is reasonable to conclude that moneyed men will be more apt to come in the market and back up several good showings with twenty-dollar pieces. The last few years' experience has shown that it is not so much the mines as proper manipulation and moneyed backing that make good-sized deals. Men with their millions of dollars will not go into anything that promises lawsuits and losses. With the dog-in-the-manger parties quieted by law, then those who can and would do something have inducement to enter the market. With leaders, others will follow. There is plenty of money on the outside which only awaits an opportunity to present itself for a speculative gambler. The history of the Comstock shows that, however much dealing in the mining shares has been condemned and men state they would not invest, yet they forget themselves and venture in when the market is made active and attractive by higher and fluctuating prices. The two latter have never failed to draw in outsiders. The mines are unquestionably in splendid condition for working, and with more miners put on in two or more of the mines, ore strikes of some importance would follow. As it now is, the work in about all, if not in all, is being done in a kind of killtime way, and this never pays.

At this writing it looks as if the market will sell at still better prices, and then go off. It also looks as if some of the shares, notably those of the north end mines, will have to sell still lower, but how much it is hard to say. To hold the down move, Con. Virginia and some of the others will probably be assessed soon.

From the mines the favorable advices heretofore reported continue to come to hand. In the Alta group it looks as if the managers are trying to see how much a showing of work can be made without much being done. In the Gold Hill group Overman seldom finds mention in official published reports. In this mine some good work is being done. In Crown Point the work to the east ought to show results before the spring months pass. In Seg. Belcher and Belcher the work is being pushed slowly, but as it is to the west it is in the right direction. The west workings in Crown Point are seldom mentioned. It is to the west where the best results are looked for. In Yellow Jacket the work being done ought to show up something before many weeks pass. Experienced miners are watching it with considerable interest. The west workings on the upper levels in Challenge and Confidence do not attract much attention, yet they are quite important. The same can be said of Con. Imperial. In Alpha there is a promising outlook for better things before long, provided the work is not stopped or turned. In the middle group of mines there is nothing new to report. Ore extracting continues, and some interesting prospects are being followed. It looks very much as if in at least two of these mines much better things can be looked for with great confidence before the summer months. Hale & Norcross is said to be more than paying expenses, and if the lawsuit was decided and well out of the way better prices for the shares would rule. In Gould & Curry and Best & Belcher the work under way is essentially unchanged. The work going on in Con. Virginia is on two levels and takes quite a force of men, which is eating up the surplus funds in the absence of ore extracting. Old miners are disappointed in an ore body not being struck before this, but the company made an assessment strike and is in a fair way of making another before long. These are indispensable luxuries for the managers, if they are not for the shareholders. The work in Ophir and Mexican is essentially unchanged, and can remain in that delightful condition for many months to come if it so desired. The same remarks can be applied to Union and Sierra Nevada.

The work on the Brunswick lode does not "pan" out so well as many had been led to believe, yet they express confidence in the future. It is to be hoped they will not be disappointed. There can be no doubt of work being actively pushed, and if there is anything of importance to be found it will be discovered. Many miners have confidence that this lode will yet surprise the street; so far the surprises have been in the regularity of the assessments, but it takes money to run a mine. The Occidental mine is most promising at present.

From the Bodie district nothing of interest comes to hand. Not even an assessment has been levied, so as to break the monotony of events. These mines are very economically handled, which reflects credit on the management; but this is small comfort to shareholders who are expecting an ore strike. Possibly this will come in the course of human events.

The following illustrates the changes of the week:

| MINES. | Feb. 6. | Feb. 13. |
|---|---|---|
| Alpha | ..... | ..... |
| Alta Consolidated | $ 07 | $ 15 |
| Andes | 17 | ..... |

# Assessment Notices.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 10th day of February, 1896, an assessment (No. 3) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 38 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of March, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 10th day of April, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office, 38 Crocker Building, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 30th day of January, 1896, an assessment (No. 42), of 15 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, No. 22 Nevada Block, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of March, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 28th day of March, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

JNO. W. TWIGGS. Secretary.

Office—No. 22 Nevada Block, San Francisco, California.

JUSTICE MINING COMPANY. — Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of January, 1896, an assessment (No. 60) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 309 Montgomery street, Room 23, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of February, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 9th day of March, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. E. KELLY, Secretary.

Office—No. 309 Montgomery street, Room 23, San Francisco, California.

ALTA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Gold Hill Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of January, 1896, an assessment (No. 51) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 33, Nevada Block, No 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of February, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 9th day of March, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. E. JACOBUS. Secretary.

Office—Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

## A SMALL COMPANY FOR ALASKA GOLD MINES.

Practical Miners with $150.00 desiring to join can obtain full information by addressing CAPT. H. WEBBER, 5 Steuart St., S. F., Cal., or J. H. CONGDON, Berkeley, Cal.

Provisions furnished for seven months.

## HYDRAULIC MINING

By the HYDRAULIC GRAVEL ELEVATOR SYSTEM a Specialty.

Examinations and Reports of Mining Properties made.

Catalogues of HYDRAULIC MINING MACHINERY and Circulars explanatory of the HYDRAULIC GRAVEL ELEVATOR SYSTEM furnished upon application.

R. H. CAMPBELL,
602 Market St., Crocker Bldg., San Francisco.

## VAN DUZEN STEAM JET PUMPS

*THE BEST IN THE WORLD.*

Pumps any kind of Liquid. Always in order. Never freeze nor freezes. Fully Guaranteed. COST $7 AND UPWARD. Especially useful for Mines, Quarries, Pits, Wells, Clay Pits, Breweries, on Steamships, Ferryboats or any place where steam is available and liquid to be pumped. A full supply in stock. Address.

JAS. LINFORTH, 37 Market St., S. F.

Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

**MINING AND SCIENTIFIC PRESS,**
**220 Market Street..... San Francisco, Cal.**

*Assaying.—Part I—Gold and Silver Ores.*
Second edition. By C. H. Aaron. Embraces 130 12-mo pages, with illustrations, well bound in cloth: 1889. Price, postpaid.....$1 00

*Assaying.—Parts II and III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.*
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

*Assayer's Guide.*
By Oscar M. Lieber.....$1 50

*Assayer's Manual.*
By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. Lynwood Garrison. Illustrated.....$3 00

*Manual of Assaying—Gold, Silver, Copper and Lead Ores.*
By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

*Notes on Assaying and Assay Schemes.*
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

*Blowpipe Analysis—Manual and Qualitative.*
By F. M. Endlich.....$4 00

*A Practical Guide for Prospectors, Explorers and Miners*
By C. W. Moore. With numerous illustrations.....$1 50

*The Explorer's and Assayers' Companion.*
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$5 00

*Aaron's Leaching Gold and Silver Ores.*
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

*Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.*
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

*Modern Copper Smelting.*
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

*Cyanide Process.*
By M. Eissler.....$3 00

*The Metallurgy of Gold.*
By M. Eissler. Profusely illustrated.....$5 00

*Losses in Gold Amalgamation.*
By W. McDermott and P. W. Duffield.....$2 00

*Electricity in Mining.*
By Sylvanus P. Thompson.....80 cts.

*Practical Treatise on Hydraulic Mining.*
By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc A very practical work for gold miners and users of water. Price, postpaid.....$5 00

*Practical Hydraulics.*
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

*Hydraulic Gold Miner's Manual.*
By T. S. G. Kirkpatrick. With plates and cuts.....$2 25

*Manual of Hydraulic Mining for the Use of the Practical Miner.*
By T. E. Van Wagenan.....$1 00

*The Coal Mines of the Western Coast of the United States.*
By W. A. Goodyear. 12 mo., cloth.....$2 50

*The Sampling and Measurement of Ore Bodies in Mine Examinations.*
Well printed on fine paper, with plates; complete. Price, postpaid.....25 cts.

*Manual of Mining.*
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

### An Interesting Example of Ropeway Practice.

A Vulcan ropeway has just been started in operation at Empire, Nevada, that merits more than a passing attention, both by reason of special features of construction and ingenuity of mechanical detail, but more particularly on account of the economy of operation, resulting in a very low cost per ton for transportation, due to the extent to which automatic appliances have been used in this ropeway for the loading, carrying and dumping of the material conveyed, those automatic features including the Vulcan automatic loader and the Vulcan automatic dumping device. This ropeway is used for conveying 200 tons of tailings daily from the dumps or bed of tailings to the Mexican mill, a distance of a little less than a mile. It is the purpose to treat these tailings, of which there is an accumulation of several hundred thousand tons, by a new process, which results in the recovery of a large portion of the precious metal yet contained in these tailings, and which has hitherto been considered as beyond recovery and valueless. Fig. 1 gives a good general idea of the nature of the ground on which this ropeway is erected, this photo being taken looking from the Mexican mill. It will be seen that the ground is level or nearly so, and that the ropeway crosses a river (the Carson). Particular attention may be called to the fact that the ropeway runs in a straight line to the point marked "turn" (Fig. 1), and there makes a turn or angle of 60 degrees, running thence directly to the point marked "loading terminal," where the tailings are loaded onto the ropeway.

FIG. 1.—GENERAL VIEW OF ROPEWAY.

FIG. 2.—LOADING TERMINAL.

The method of making the turn is illustrated by Fig. 3, on page 145. The main point to be considered in planning a turn is that the hangers of the buckets must be kept on the outside of the rope when going around a horizontal sheave, *i. e.*, must not come between the rope and the sheave. If a turn could be made by placing a horizontal sheave in the inner angle of the outgoing rope, and likewise one in the inner angle of the incoming rope, it would be a simple matter to so make a turn. In fact, however, it is possible to so place only one such sheave and thus make a turn directly with one of the ropes. To satisfy the previously mentioned condition, it is necessary to construct a number of sheave structures outside of the line of ropeway proper, the purpose of these structures being to so lead and change direction of the other rope that it will finally start in its proper direction in the line of ropeway, with the buckets on the outside of the rope. These various sheave structures are shown in Fig. 3. (See page 145.)

The method of loading the buckets is of special interest and is one of the important features of the Vulcan ropeway. This loading is done at the loading terminal, shown in Fig. 2, and which consists of the terminal machinery and framework proper, an automatic loader, a small storage bin of about twenty tons capacity to supply the loader and an elevator to raise the tailings from the ground into the bin. A sectional drawing of such an arrangement is shown in Fig. 4 (see page 145), except that Fig. 4 shows the ordinary case of the storage bin filled directly by the ore cars from the mine.

In the ropeway we are describing, the tailings, as they are brought to the loading terminal, are dumped into the boot of the endless chain-bucket elevator, and from thence elevated to a height of some thirty feet and dropped into the bin.

The loader consists briefly of the stationary hopper *D* (Fig. 4), the traveling hopper *C*, and means whereby an exact load for a bucket on ropeway *B*, and that is contained in stationary hopper *D*, is automatically transferred to the traveling hopper *C*, and from hopper *C* to the ropeway bucket. All this is accomplished by one man, who handles the lever *E*, which controls the gate of the storage bin.

The elevator and automatic loader are both driven by means of gearing from terminal machinery proper.

The buckets, loaded in the manner just described, and fastened to the endless moving wire rope, are carried into the mill building and there dump their loads of tailings, automatically, into the large storage bins inside the mill. This ropeway, being built on a practically level country, has to be operated by some auxiliary power, and hence is connected to the mill machinery by a ropedrive, about 8 H. P. being required in all.

The total operating expense for loading, transferring and dumping the 200 tons daily is stated to be the labor of one man plus the cost of 8 H. P., which would figure out about 2½ cents per ton.

The total cost of the ropeway erected in running order, but not including freight, was approximately $9000.

We add to the illustrations of this ropeway a cut (Fig. 5, on page 145) showing the delivery or lower terminal of a ropeway, placed inside a mill building, and so as to permit the buckets of ropeway to dump directly onto the grizzly, or grizzlies, as the case may be. The Vulcan ropeway is built by the Vulcan Iron Works of San Francisco, which makes a specialty of ropeways, in connection with its business of building mining machinery in general.

Many of these Vulcan ropeways are in use on the Pacific coast, and in Mexico, etc.—one having been recently completed and started in successful operation at the mine of the Bald Mountain Mining Co., Montana.

TABLE OF CONTENTS.

ILLUSTRATIONS.—General View of Ropeway; Loading Terminal, 141. View of Turn Structures; Vulcan Automatic Loader; Delivery Terminal, 145.

EDITORIAL.—An Interesting Example of Ropeway Practice, 141. Twenty-fifth Anniversary of the Corner-Stone of the New City Hall; An Alleged "California Exhibition" in New York; List of Dividends Paid by Incorporated American Mining Companies in 1895; The Roentgen Rays; The Cathode or X Ray; Sixteenth Annual Report of U. S. Geological Survey for 1894-95; Greatest Depth Attained by Miners; The Mineral Land Bill; The U. S. Gold Product for '95, 142.

SCIENTIFIC PROGRESS.—Effect of Using Corrugated Glass; Revealing Hidden Solids; The New Photographic Process; The Effect of Improved Methods Upon Prices, 148.

MECHANICAL PROGRESS.—Hardening Steel; A Big Leak; Soldering Glass; Why Presses Are Succeeding Hammers, 148.

ELECTRICAL PROGRESS.—Making "Scorchers" of Some Use, 148. Success in Electrical Engineering; Electric Railroads Under Jurisdiction of the Railroad Commissioner, 149.

PRACTICAL INFORMATION.—Some Mile Records; Care of Lamps; Some Wasted Sun Force, 149.

MINING SUMMARY.—From the Various Counties of California Nevada and Other Pacific Coast States and Territories, 150-51.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 158.

MISCELLANEOUS.—Concentrates, 143. Notes on Gold Milling in California; Capital Invested in the Ore Business of the Lakes; A Great Feat, 144. Testing the Ores; A Common Belief; Venezuela's Clear Title; Peculiarity of Pearls, 145. Magnesite; The Anti-Debris Association; Internal Heat of Mines, 146. Modification of the Chlorination Process; The Dog-in-the-Manger Policy; Thinks Them a Good Investment; Preliminary Announcement 29th Industrial Exposition, Mechanics' Institute, 1896, 147. Coast Industrial Notes; Personal; Commercial Paragraphs; Obituary; New Mining Incorporations, 152. Notices of Recent Patents, 159.

TWENTY-FIVE years ago to-day—Feb. 22, 1871—the corner stone of the "new City Hall" in this city was laid. The structure was to cost $2,000,000. It has cost over $5,000,000 and is not yet finished.

SEDUCTIVE statements are being made regarding an alleged "California Exhibition" in New York City, next May; among other things it is represented as being under the auspices of the California Board of Trade. It is a private affair, has a suspicious look, is in no way endorsed by any California commercial body and intending exhibitors should know something more positive about it before paying for space. It may be a worthy scheme, but it claims too much and has a shaky appearance.

IN last week's issue appeared on page 130 a list of dividends paid by incorporated American mining companies in 1895, in which California was credited with dividends aggregating $557,110. In answer to sundry hasty criticisms received, it is but necessary to point out that the list distinctly included only *incorporated* companies. It is not "the fashion" to incorporate gold mining companies in this State, the biggest, best and oldest producers are not owned by incorporated companies, and hence, the dividends declared by them were not included in that list which was only of incorporated companies. This has all been said before, but it is in order now to say it again.

IF, as claimed, it has been successfully demonstrated that the cathode or X rays used by Prof. Roentgen to produce photographs of the interior portions of the human body, and to photograph ordinary objects through opaque substances, can be focused, a most important discovery is made in connection with these wonderful scientific experiments which will make it more valuable. By being able to focus the rays, any particular organ of the body may be photographed without the surrounding tissues being shown. A St. Louis, Mo., dispatch says Dr. Wellington Adams and Prof. Nipher of Washington University have been thus experimenting with the Roentgen system of photography, and have succeeded, yet from the nature of the shadows (for shadows only they are) and their method of production, it seems impossible to talk of a focus in connection with the matter.

AMONG the most important investigations which are being conducted with a view of determining the value of the Roentgen rays are those made by Mr. Charles M. Scribner of the Western Electric Company in their laboratory at Chicago. "I am particularly interested," says Mr. Scribner to the representative of the MINING AND SCIENTIFIC PRESS, "in ascertaining the worth of the process considered from an industrial standpoint. If I can be able to say to my company, 'This shaft has a flaw in it,' or, 'The composition of that metal is imperfect,' my work will be of a value scarcely to be estimated. This will, I believe, soon be determined. Every day some new development is recorded. The first plate I made was so inferior to those sent me from Germany that I concluded the German photographs had been retouched. After three days, however, I had made as good photographs as any of those imported."

PARTS III and IV of the sixteenth annual report of the U. S. Geological Survey for 1894-95 are received. Part III is devoted to the metallic products, part IV to the non-metallic products. Of part III the first 217 pages are devoted to an exhaustive discussion of the production of iron ores in various parts of the world, a reconnaissance of the gold fields of the southern Appalachians occupies the next seventy-two pages, the next thirty-seven pages are taken up with a dissertation on copper, and articles on lead and zinc occupy the next thirty-two pages. The best article on manganese that has so far come under our observation takes up from page 389 to page 457, the production of tin is given the succeeding seventy-eight pages, aluminum and bauxite have fifty-seven pages, quicksilver nine pages, and chromium, tungsten, antimony and platinum occupy the remaining twenty-five pages of a work that is a model production in every respect; the tables, maps, statistics and descriptive information make the book valuable. Part IV, a companion volume, is of equal value as regards the non-metallic mineral products of the country. To coal and coke are surrendered 300 pages, petroleum has eighty-nine pages, stone has nearly 100 pages, and the clay industry is given corresponding space. The volumes are admirably indexed, and the arrangement of their contents reflects credit on Dr. David T. Day, chief of division. The volumes can be procured through members of the California Congressional delegation.

THE mineral land bill passed the House of Representatives without dissent on the 17th inst. It is now in the hands of the Senate Committee on Public Lands, and when passed by the Senate and signed by the President will become a law. The present bill is not as satisfactory as the last one commented on. The Johnson bill, as noticed last week, was about right. The bill which passed last Monday is really a substitute measure introduced by Congressman Bowers on the 11th inst., as H. R. 5819. There are some changes in it as to the definition of what constitutes mineral land, the section in the bill passed being susceptible of different interpretation from the wording of the Johnson bill in that regard. The Johnson bill provided that all the twelve Commissioners should be residents of this State: the Bowers bill requires that but one of each of the four Boards of three Commissioners each shall be a resident of California. There are other changes, but the two indicated are believed to be the most important. Secretary of the Interior Smith is not satisfied with the bill and may want to make further modifications and changes in it. However, as it now stands it is probably the best that can be done, and for this reason should, we think, meet with the approval and endorsement of the miners. To amend it now would mean that it would have to again run the gauntlet of the House; then, if not approved, a conference committee would have to be appointed, composed of members from the Senate and House, and the result of their agreement (if they did agree) would have to be passed by both Houses before being submitted to the President for his signature. Hence as there is no active Congressional opposition to it in its present shape, and there is a strong probability of its becoming a law, it is, probably, better to acquiesce and do all possible to have it pass the Senate and receive the Presidential signature.

AT the greatest depth ever attained by miners in the history of the world, the miners in the vertical Red Jacket shaft of the Calumet & Hecla copper mine have stopped sinking at a depth of 4900 feet, as this is the required depth necessary for this company to reach the limit of its underground territory. (The No. 3 and No. 4 shafts of the Tamarack mines had to be sunk nearly this enormous depth before the copper-bearing conglomerate was reached.) The Red Jacket shaft is the largest and best constructed mining shaft in the world. Its inside dimensions are 14x 22½ feet, divided into six compartments and timbered throughout with pine. President Agassiz, in his report for 1893, stated that "the Red Jacket vertical shaft was planned after the two mine fires of 1887, in order to insure against the loss of the northern extremity of the mine, in case of a similar disaster in the future, and to give access to the lower levels of the mine." The shaft was started in the fall of 1889. He further states "that nothing but the losses incurred by the succession of fires from 1884 to 1888 would have warranted us in starting so expensive an undertaking, and one of so doubtful utility, for the ordinary working of so narrow a belt as the Calumet conglomerate, which can be worked far more economically by slopes such as we have laid out in the South Hecla." The new shaft-rock house, which will be built of iron and will be made fireproof throughout, is the only part of the work necessary to put this deep shaft in commission, as the hoisting machinery, which consists of two pair of triple expansion engines of 3000 H. P. per pair, and will hoist a load of ten tons 60 feet per second, was planned and put in place while the sinking of the shaft was going on. With the exception of the terrible accident caused by the engineer pulling the cage up to the roof of the shaft, and by which ten miners were dashed to atoms at the bottom, no other serious fatality occurred.

## U. S. Gold Product for '95.

Full returns of the gold production of the United States for 1895, received by telegraph at the Mint Bureau, afford a total of $53,031,800. This is an increase of about 35 per cent over the production of 1894, which was $39,500,000, and a still larger percentage over the production of 1893, which was $35,995,000.

The estimate for 1895 has not yet been fully accepted by Director Preston. He is still unwilling to place the final verification figures higher than $48,000,000, and declares that the production will range between this maximum and $46,500,000, as a possible minimum. The reports from the special agents, which make up this total, are always subject to comparison with the deposits of gold at the mints and assay offices and with the product of private refineries. The final results usually reduce the estimates of the agents about 10 per cent, which would leave the production of 1895 close to $48,000,000.

The most recent reports have not been received from Arizona nor Michigan, but the figures given below for these communities are based upon earlier reports during the year or upon the figures of 1894. There has always been some trouble at the Mint Bureau regarding the figures from Oregon and Washington, and one of the agents puts them at $1,281,600 and $206,700, respectively, instead of the figures given in the table. The table represents, however, the official estimates of expert employes of the Mint Bureau, and presents a more accurate view of the production of 1895 than has ever before been presented so promptly at the close of a calendar year. The value of the production of gold, by States and Territories, for the past two years, foots up as follows:

| *States and Territories.* | *1894.* | *1895.* |
|---|---|---|
| Alaska | $1,113,550 | $1,500,000 |
| Arizona | 1,784,485 | 2,500,000 |
| California | 13,579,397 | 15,600,000 |
| Colorado | 9,491,514 | 15,000,000 |
| Idaho | 2,081,281 | 2,790,700 |
| Michigan | 44,444 | 50,000 |
| Montana | 3,651,410 | 4,392,600 |
| Nevada | 1,137,819 | 1,700,000 |
| New Mexico | 567,751 | 1,075,000 |
| Oregon | 1,422,056 | 2,200,000 |
| South Dakota | 3,299,100 | 4,255,000 |
| Utah | 868,031 | 1,352,300 |
| Washington | 195,100 | 300,000 |
| Appalachian | 273,072 | 316,200 |
| Totals | $39,500,000 | $53,031,800 |

If these figures are borne out by the final reports, the year 1895 will occupy a unique place in the history of the production of the precious metals.

Previous estimates which have put the gold production of the United States at $46,000,000, have put that of the world at $200,000,000. The present increase in American production will carry the total for the world to $205,000,000, as compared with $118,848,700 in 1890, $130,650,000 in 1891, $146,815,100 in 1892, $157,297,000 in 1893 and $179,965,600 in 1894.

Silver production in the United States has not fallen off so much as was anticipated, and the reports of the special agents put the figures for 1895 at about 51,000,000 ounces.

## Concentrates.

EIGHT diamond drills are in operation at Leadville, Colorado.

A POSTOFFICE has been established at Star, Tuolumne Co. Wilbur Long is postmaster.

LAST month the miners of Virginia City, Nev., subscribed $1424.50 to the orphan asylum there.

TO be in the fashion, St. Louis, Mo., sends word that a mining exchange is to be organized in that city.

THE Cripple Creek, Colorado, *Mail* of the 15th inst. contains 223 notices of application for U. S. mining patents, etc.

THE sale of the mining machinery belonging to the Gladstone mine, Shasta Co., took place yesterday at Redding.

THE Central Hill hydraulic mine, Nevada county, resumed operations this week under a permit from the Debris Commission.

SOME of the officers of the San Francisco Stock Exchange are organizing what is styled the Development and Investment Co.

THE Live Oak Consolidated Gold Mining Company has levied an assessment of ten cents per share, delinquent March 9.

THE California Mining Company, of Nevada County, Cal., has levied an assessment of two cents per share, delinquent March 12.

THE Argonaut shaft, Amador Co., has reached a depth of 1100 feet, with 100 feet more to go, when drifting to the ledge will be in order.

SUPERINTENDENT LAMAN of the Con. Cal. & Va. reports that the output of the mine for the past week had been 195 tons, assay $38.58 per ton.

L. A. DUNHAM, manager of the Revenue mine, Madison Co., is stated to be operating the only successful cyanide plant in the State of Montana.

A SHIPMENT of gold bars, valued at $87,500, being the product of a three months' run, was received this week from the Apollo mine of Alaska.

IT is estimated that over 1200 men have left Ballarat, Australia, and adjacent district during the past few months for Coolgardie and South Africa.

ARTICLES of association of the Leland Stanford Gold Mining Company, an English corporation, have been filed at Prescott, Arizona; capital, £60,000.

"THE manufacture of alkaline cyanide from black muck" will engage the attention of the American Cyanide Company, recently organized at Glenville, N. J.

THE Idaho & Pittsburg M. & M. Co. are about to buy the Phillips & Sullivan group on Florida mountain, Silver City, Idaho, and consolidate the two properties.

A NEW water-power hoist is building for the north shaft of the Kennedy mine, Amador Co. The shaft is now 2000 feet deep, and is to be carried down 200 feet farther.

BAKER CITY, Oregon, wants a chlorination plant built there and claims that sufficient mines exist in that vicinity to make such reduction works a paying investment.

"INQUIRER," De Lamar, Nevada, is informed that since Jan. 1st, 1888, silver's highest quoted price was on August 20th, 1890, when it sold for $1.19½. To-day it is 67¼c.

'TIS easy at present to dub a claim a "wild cat," but not always truthful. What was the wildest of wild cats yesterday may be a paying mine and a good buy to-morrow.

SUCH a flow of water was struck in the Hecla shaft at Mercur, Utah, one day last week, that the water overflowed the shaft and ran in a stream down the main street of the town.

EIGHT truckloads of dynamite exploded at Viedendorp, near Johannesburg, South Africa, last Wednesday, killing over 100 people, wounding 200 more and devastating the surrounding country.

POTTER & TIGNER, representing the Iowa Mining Co., of Des Moines, Iowa, have secured possession of the White Swan mine, Virtue district, Baker Co., Oregon, and will resume work thereon.

THE Le Roi Mining and Smelting Co., owner of the Le Roi mine at Rossland, B. C., has paid a dividend of 10 cents a share. The capital stock of the company is divided into 500,000 shares.

THE *Alaska Mining Record* tells all and sundry that no one should think of attempting the Yukon expedition "who is not possessed of an iron constitution, $500, and some knowledge of mining."

E. R. DODGE of Reno, Nev., has bonded all the placer claims in Sandorus district, Humboldt county, for Nevada men. Survey is making for a ditch from the Little Humboldt, twenty-two miles distant.

SOUTH AFRICA is not the only country where American miners get big salaries. General Manager Plummer, of the De Lamar Mining Co., Idaho, is credited with receiving an annual salary of $25,000.

"TO SETTLE A BET," it is stated that a ton of gold, troy, is worth $496,123.20; a ton of gold, avoirdupois, $602,921.93. When buying gold by the ton always insist on the seller furnishing it on the avoirdupois basis.

AT the Alaska mine, Pike City, Sierra Co., Cal., about twenty men are at present employed by the English company which recently bought the mine, repairing the mill and machinery. Active work will soon be resumed.

"NINETY-FIVE per cent gold and five per cent silver" is the alleged constituency of ore in a mine the stock of which is offered by a Chicago mining broker to a confiding public for the ridiculously low price of 2½ cents a share.

A SHASTA COUNTY subscriber writes that he "wouldn't be without that page of Concentrates for a dollar a copy." Glad he is so appreciative, but "Concentrates" believes the other nineteen pages are of equal value with this one to every mining man.

THE January cleanup at the South Eureka, Amador Co., yielded $11,000—nearly $15 per ton. The twenty-stamp mill only crushes thirty tons per day; the average crushing capacity of mills of modern construction is double that. The January run represents a net profit of $6000. A contract to sink the shaft 200 feet deeper was awarded last Wednesday at $13.80 per foot.

"SO FLEET the works of man back to earth again; ancient and sacred things fade like a dream." Suggested to the *Oasis* by the fact that in Prescott last week the sole remaining house in Arizona charging "two bits" a drink reduced its prices to twelve and one-half cents.

THE Good Hope Mining Company, Amador Co., has levied an assessment of five cents per share, to pay off its indebtedness. A meeting of stockholders has been called for the 21st day of April to consider the advisability of increasing the capital stock from 50,000 shares at $10 each to 700,000 at $1 each.

CONSIDERABLE hydraulic piping is sent from here to British Columbia, but that a good deal more is used is evinced by the fact that during 1895 twenty-five carloads of iron pipe were brought from the New England States to Ashcroft, B. C., the freight on which to Kamloops was over $10,000.

OREGON has a little mining "boom" at Gates, Marion Co., where several thousand dollars has recently been spent developing the Lawler group of mines. The ore is locally stated to exceed $15 per ton in average value. A stage line has been started from Lebanon and there is considerable stir.

F. D. NOWELL of Juneau, Alaska, is reported in the Alaska *News* to have bought eight claims on Sheep Creek, Alaska, for $200,000. F. C. Hammond is superintendent, and is credited with immediate intention to buy considerable in the way of stamps, concentrators, electrical appliances, drills, compressors, etc.

VERY little is being said and a good deal is being done at Keswick, Shasta Co., this State, where an English company paid $300,000 for a copper-gold property, put 1000 men to work, built a railroad 12 miles long, is putting in four smelters, has spent nearly a million dollars and will shortly begin shipping copper matte and making money.

DURING January, 1896, the Tacoma, Wash., Smelting and Refining Co. produced 3200 bars of bullion, weighing 328,071 pounds, containing 1433.70 ounces gold, at $20.67 per ounce, $29,634.58; 24,857.14 ounces silver, at 67 cents per ounce, $16,654.28; 326,268 pounds lead, at $2.95 per hundredweight, $9624.90, a total of $55,913.76.

OVER at Butte, Montana, the Union Iron Works of this city will shortly install the largest plant of hoisting machinery in the State, at the St. Lawrence mine for the Anaconda Co. It will be of 3000-horse power, will have a capacity for hoisting six cars of ore from a depth of 6000 feet in two and one-half minutes, the reels holding 6500 feet of 8-inch flat cable.

IT is soberly stated in the press dispatches that "a number of well-known New York capitalists have formed a company with $5,000,000 capital stock," to mine for diamonds in California. Diamonds have been found in various parts of this State, notably in El Dorado county; and if these New York men do sufficient development work, they can doubtless find some more.

LAST Sunday's San Francisco *Call* has an effective cartoon representing idle California mines, a safe marked "U. S. Treasury, empty," a giant ready to sluice the gold from the hills; in the foreground Uncle Sam seated dejected, a female figure typifying California standing by, leaning on a shield and saying "Open the mines and you will have no need to borrow gold."

T. L. FORD is working hard in Washington for the mining legislation delegated to him. If he can effectively aid in securing the passage of the appropriation bill he will be particularly fortunate, for this is a bad year for the most worthy measure in the national legislature, if it carries with it a dollar of appropriation out of the federal treasury. The justice and equity of the measure should ensure its passage.

THE Georgetown, Colo., *Courier* says that the owner of a lode in Clear Creek county, Colo., had some ore assayed which showed values in both gold and silver. But, whether because he was a disgusted silver advocate or a more than usually idiotic goldbug, he seemed displeased because the ore carried silver, and requested the assayer to make out a certificate showing only the gold value. He wanted to have nothing to do with silver.

A CABLEGRAM last Tuesday from the Rand, South Africa, says that John Hays Hammond and the other prisoners have been liberated by the Transvaal Government under $10,000 bail each. They will remain under police surveillance. The Robinson mill has shut down for lack of native labor. To a deputation representing 5000 of the Rand unemployed the Transvaal Government replied that it would do its best to relieve their situation.

BY a gas explosion in the Vulcan coal mine at Newcastle, Colo., last Tuesday, all the workmen in the mine, over forty in number, were instantly killed. All the buildings were wrecked. The reputed cause was a half-lighted fuse igniting the gas in one of the new chambers where the men were blasting down coal. The State Coal Mine Inspector had visited the mine on the 8th, ten days before the explosion, and pronounced everything in satisfactory condition.

CONGRESSMAN GROVE L. JOHNSON denies the statements wired here this week that he was opposing the national legislation asked for by the miners, and says he is in accord with the proposed measures. He pledged himself before the recent election and again at the Miners' Convention in this city last November, and says now that he will vote and work for the passage of the appropriation bill. The California delegation is united on this measure and there is good reason to look hopefully for its enactment.

THOUSANDS of old prospectors, and many more who are looking for gold ore for the first time, will be out this season in every part of the country. The old laws of supply and demand apply in this case. With gold at $20.67 per ounce, and silver the same minus the $20, with a gold mine worked more cheaply than a silver mine, and with little immediate prospect of favorable national legislation, no wonder that every nook of the coast is now being searched for gold-producing properties.

AN interesting discovery was made when the $1,300,000 in gold which was taken out of the stranded steamship St. Paul was received at the sub-treasury in New York. It turned out to be the identical gold that had been taken from the subtreasury only a few days previously. It had made the round trip to Europe and back, endured the peril of shipwreck and came into the treasury for examination again as fresh as foreign gold. It was no new revelation, however. It is a trick that has been played repeatedly.

OF SOME interest to mining machinery men is a decision last week of the Idaho Supreme Court. The Colorado Iron Works sold machinery to the value of $535 to William Reikenberg, of Owyhee county, Idaho, and brought suit to foreclose a mechanics' lien on certain property. The Supreme Court of that State holds that plaintiff was entitled to judgment for the amount, but was not entitled to a mechanics' lien, for the reason that there was no express contract that the goods were to be furnished for the particular "mine, mill or structure upon which the lien was claimed."

AMONG the probable "rushes" and "booms" this spring it is likely a good many are thinking of going to Alaska. Those who've been there and who are entitled to credence, and who are not interested in steamship or transportation companies, say "go slow." There will be many a disappointed man, many will lose all they have now, and more than one poor fellow will lose his life. It is not a poor man's country and no one should think of going unless prepared in every way for toil, hardship and exposure.

SOME of the Western roads are stirred up over the invasion of their territory by the seaboard air line. That road carried last week a large party of miners from Denver to New York, with the object of participating in the opening of the New York Mining Exchange. The Western roads offered the party a rate of $63 for the round trip. The seaboard air line took it for $50 each for the round trip. It made a combination with the Denver & Gulf and the Southern Pacific and took the party via New Orleans. The other roads are worked up over the incident, their ire being aroused on account of the invasion of their territory more than over the loss of the business.

A CALLED MEETING of the Executive Committee of the State Miners' Association was held in the Union League Club rooms last Wednesday evening. Secretary Sonntag read a series of resolutions passed by the Sacramento Chamber of Commerce promising support to any bill now before Congress which would not in their judgment be detrimental to the interests of valley residents. A resolution drafted by S. B. Christy was adopted, acknowledging the receipt of the resolutions, asking for copies of the river improvement bill for examination, and reciprocating in courtesy the Sacramento communication. A resolution offered by J. M. Wright was adopted, authorizing the appointment by President Neff of a committee of five to pass upon the qualifications of applicants for Commissionerships, and make recommendation thereon in the event of the pending mineral land bill becoming a law. Inquiry was made as to Congressman Johnson's attitude toward the miners, Delegate Ford's actions were endorsed, and an appeal ordered made to the several county organizations for funds which which to defray his necessary expenses.

A MAN with a "divining rod" was reported dousing out on the Comstock this week. There are men who believe in a "mineral indicator" or "dousing rod" or "hoodoostick." Dr. Childs, a Los Angeles man, has one of those concerns that has produced "wonderful results." He says: "It is of my own design; it comprises a thin strip of steel, half an inch wide and eighteen inches long, with a copper plumb in the center. That copper top is a battery, filled with chemicals and sealed so it is always loaded. These chemicals have a proper affinity with gold, silver or quicksilver, and when I come into the atmosphere adjacent to a mineral deposit, an electric shock tells me, while the steel slip leans toward the lead. It will often fall with a jerk. By forcing it over by hand, it takes at least a two-pound pressure." It, doubtless, affords harmless amusement to the operator, but reliable assays of the ore found by means of it will still probably be insisted upon before much development work ensues. There are also men who believe in the transmutation of metals, the Keeley motor, perpetual motion, etc.

A PAYSON, ARIZONA, SUBSCRIBER writes: "The PRESS will do a number of Arizona miners and prospectors a favor if it can give, through its columns, the legal construction of the U. S. mining law, viz.: A. locates a mining claim on January 1, 1895, and claims to have until the 31st day of December, 1897, to perform his assessment work. B. claims that he (A.) locates with the assessment or calendar year and that he (A.) will have to perform the work for 1895 or it is subject to relocation on January 1, 1896. Which is correct?" A. is manifestly wrong. It has been held that the time in which the requirement of the statute begins to operate commences on the 1st of January following the date of location. If this obtains, B. is also wrong. The year in which the location is made doesn't count in the federal requirement for annual assessment work. If A. locates his claim any time in '95, he has till December 31, 1896, to do the required $100 worth of work or improvements. But whatever work or improvements he puts on the claim up to Dec. 31st, '95, won't count for 1896; he must do the required assessment work for '96 before Dec. 31st of that year, regardless of what he did or didn't do in that direction in 1895. But whether he does or does not do any assessment work this year, the claim is not subject to relocation till Jan. 1st, 1897.

A SIERRA CO., CAL., SUBSCRIBER writes as follows: "Will you kindly inform me concerning applications for patents to mining claims? There is a certain mining claim here that was surveyed and a patent applied for twelve or fourteen years ago. There has been a mill on the property, which was worked by the company unsuccessfully; afterwards it was leased and finally abandoned. The mill and all removable property was sold and removed from the ground. No assessment work has been done or taxes paid for the last year. Is this property subject to relocation, or does the application for patent hold the ground for the original owners?" Presuming that the facts are as stated by our inquirer, the property is subject to relocation. An application for patent does not absolve the applicant from any requirement as to holding the claim. Till the final entry and payment of the amount required to purchase the claim, the assessment work must be done. Pending the issuance of the patent—that is, from the time the application is made—there is by usage a period during which, apart from the sixty days of publication, etc., nothing in the way of active work is exacted; but the holder of a claim cannot continue in possession of it simply by making an application for a patent for it, neglecting to perform the required annual assessment work and neglecting or refusing to perfect title by making final entry and paying the Government price.

## Notes on Gold Milling in California.

NUMBER XIV.

By E. B. PRESTON, M. E., Field Assistant State Mining Bureau.*

No. 13 *Plumas County.* — The ore is hauled to the mill by wagon, and is broken and fed by hand. The stamps weigh 750 lbs. each, drop 5 inches to 6 inches, 80 times per minute, with a discharge varying from 6 inches to 8 inches, through a No. 9 slot-punched, Russian-iron screen, crushing 1¾ tons per stamp per twenty-four hours. The battery is supplied with an inside plate, about 6 inches wide, attached to the screen; the latter is set slightly inclined. The screen-frame leaves about 4 inches at the upper end of the mortar-front open, in front of which and reaching nearly to the lip is a canvas curtain. The apron-plate is 5x4½ feet, set on a grade of 1 inch in 11 inches; below the apron is a drop-box, from which the pulp passes to the sluice-plates; these are 10 feet long by 15 inches wide. The aprons are scraped every day with rubber belting, and the plate on the screen is cleaned once or twice a week. In dressing the plates, brine with an addition of sulphuric acid is used. About 20% of the amalgam is saved in the batteries, and about 80% on the plates. Neither concentrators nor canvas-tables are used. One tank of quicksilver is used every six months, using twenty stamps.

No. 14. *Shasta County.*— The ore carries 1½% of iron and copper sulphurets, besides free gold, averaging $9 per ton. There are 30 stamps, weighing 850 lbs. each supplied with Challenge feeders, working from the second stamp. These stamps are hung and dropped somewhat at variance with the usual custom, No. 1, the end stamp on the left, being placed 1 inch farther from the side than is No. 5, the end stamp on the right, and the sequence of the drop is 5, 4, 3, 1, 2; the stamps never rising out of the water. It is claimed that by this arrangement a better swash is obtained in the battery. The stamps drop 5 inches, 92 times per minute, with a discharge of 6 inches to 7 inches, and crushing 2 tons per stamp per twenty-four hours. The mortar is supplied with front and back inside plates. The apron-plate is 4x4 feet, set on a grade of 1¼ inches to the foot, followed by a double set of sluice-plates, 16 inches wide and 16 feet long, with a grade of 1 inch to the foot. The apron-plate is kept wet with mercury by frequent dressing. Burr-slot screens, Nos. 40 and 45, are used. About 66% of the amalgam is derived from the battery. The pulp is concentrated on four Triumph and ten Frue vanners, and is then passed to two canvas-platforms, 36 and 24 feet long, respectively, and 20 feet wide, divided into sections 2½ feet in width, covered with twill instead of canvas, which is said to give equally good results, and is considerably cheaper. These tables have a grade of 1¼ inches to the foot. The plates are scraped once a day, and the mill is cleaned up twice a month. The company chlorinate their own sulphurets, roasting in a small two-hearth furnace, with a capacity of one ton per twenty-four hours.

No. 15. *Sierra County.*—On account of topography, the ore has to be elevated by a lift to the top of the mill. The stamps weigh 850 lbs. each, and drop 5 inches, 80 times per minute, with a 6-inch discharge through No. 7 slot-cut screens. The cams, bosses, and tappets are steel; the shoes and dies iron. The apron is 4x4 feet, with a grade of 1¾ inches to the foot, and is followed by a double sluice-plate, 16 inches wide, 12 feet long, and pitched 1¾ inches to the foot. The plates are not scraped at regular intervals; in dressing them, lye is used occasionally. The plate on the screen, 6x52 inches, is cleaned every other day. About 86% of the amalgam is saved in the battery, and the tailings only show a trace of gold. Johnston concentrators receive the pulp from the plates; these concentrators are run with 110 to 112 side-strokes per minute, the belt revolving once in seven minutes. The waste from the concentrators is forced to a higher level by an "ejector" and then passes through a pointed box. The heavy material is then passed through a series of drop-boxes and discharged into the river.

No. 16. *Sierra County.*—The ore carries a considerable amount of clay and is delivered to the mill over an incline track to a Blake crusher. The stamps weigh 850 lbs. each, and make 75 to 78 drops of 6 inches per minute, with a discharge varying from 7 inches to 9 inches, using a No. 10 slot-cut screen. The inside of the mortar is furnished with front and back plates, the former 8 inches, the latter 4 inches wide. Cast-iron shoes and dies are used, crushing 1½ tons to the stamp per day. The order in which the stamps drop is 1, 5, 2, 4, 3. The apron-plate is the width of the mortar, is 6 feet long, and is set to a grade of 2½ inches to the foot, followed by 12 feet of sluice-plates, 14 inches wide. As there are but few sulphurets, no concentrators are in the mill. The apron and sluices are dressed every day, but only scraped once a month; cyanide of potassium is used in dressing the plates. The battery is cleaned once a month. About 5 lbs. of quicksilver is used to every 1,500 tons. About 70% of the amalgam is obtained from the battery.

No. 17. *Tuolumne County.*—This mill of 10 stamps crushes quartz containing little or no free gold, but with 3 per cent of sulphurets, chiefly iron. The stamps weigh 1,000 lbs. each (fed by self-feeders), working at 96 drops of 6 inches, crushing 2½ tons per stamp. Chrome steel shoes and dies are used, which wear about 1-inch per week. No. 30 brass wire screens are used, the screen having a slight inclination, 10°. There are no plates used on the inside of the battery, and only one apron-plate, 4½x6 feet, to each five stamps, which is dressed daily. It is set to a grade of 1¾ inches to the foot. Nearly all of the amalgam is derived from this apron. The plup passes from the aprons through a series of troughs to four Frue concentrators with corrugated belts, using a large amount of water. These are succeeded by wooden troughs, 8 inches wide at top, spreading to 16 inches, which divide into three troughs, carrying equal amounts of pulp, thinned by adding 3 miner's inches of clear water above the forks. These deliver into a V-trough running at the head of a canvas-platform, divided into twelve sections, 22 inches wide and 75 feet long, set on a grade of 1½ inches to the foot. These tables are covered with No. 7 duck, which last 90 days. The V-trough has extending over its entire length a square 8-inch trough, for clear water. The pulp flows from the V-trough through 1-inch auger holes (two to each section of the canvas), supplied with wooden plugs to regulate the flow of the pulp, the clear-water trough being similarly supplied. Every half hour the flow of the pulp is arrested on a section, while the flow of clear water is continued until the lighter sands are washed off, leaving the sulphurets on the canvas. The flow from the tables is delivered into V-boxes running across the end of the canvas-platform, with a garde from the outer edges to the center, and delivered to a second canvas-table trough, where it undergoes a similar treatment. After removing the lighter sands from the upper platform, a sheet-iron pan is placed below the end, which extends to a separate trough into which the sulphurets adhering to the canvas are swept with the aid of the flowing clear water, and conveyed to a settling-tank divided into two sections in such a way that when one section is filled, the sulphurets are run into the second section, allowing the first to be shoveled out, each section being treated consecutively. When No. 1 is being swept, No. 2 has the plup-flow shut off, making the operation continuous. After sweeping down a section, the plugs from the pulp trough are removed and the clear water shut off, permitting the concentration to be renewed. It requires the attention of two persons, night and day, to attend to these two platforms. Everything but the sweepings pass over the second canvas-platform, and then goes to waste. The sweepings from the second table are treated in a manner similar to those from the upper one. Accessory to these two sulphuret settling-tanks are two large slime settling-tanks; these are divided into twenty-sections, 2 feet square, 20 feet long divided from each other by 2-inch plank extending entirely across the tank. Within 2 feet of the ends, on alternate sides of these divisions, slots 4 inches deep and 2 feet wide are cut to permit the water, which is clouded with the fine slimes, to pass from one division to the other. At the end farthest from the entrance, the water (still somewhat clouded) runs to waste. The slime water from the first settling-tank passes through the second. The sulphuret settling-tanks are shoveled out every few days, while the slime settling-tanks remain undisturbed for months. The material from the vanners, upper and lower settling-tanks, and sometimes from the slimes, is mixed by weight before going to the chlorination works. There are 2,400 sq. ft. of canvas-tables and 5,000 sq. ft. of settling-floor.

No. 18. *Tuolumne County.*—This mill is working on quartz carrying both free gold and sulphurets. The ore is delivered from the mine at the top of the mill, into a general ore-bin, for the entire 40 stamps, after passing through the rock-breaker. The bin has a capacity of 650 tons, and delivers the ore into the self-feeders direct. The stamps weigh 850 lbs. each, and steel shoes and dies are used. Each stamp has its separate guide, made of two blocks of hard maple, fitted together and bored through to receive the stem. The front block is first put in place, the stem set in, and the rear block dropped in behind a cast-iron piece, which is secured by wooden wedges driven in from above, so that when required it can easily be removed. The pulp from the battery falls over a 9-inch silvered plate, the width of the mortar, into a box 12 inches square, supplied with six 1-inch holes, 8 inches apart, near the front lower edge, that permit the pulp to flow onto a 4x5-foot silvered plate, divided in two parts by a wooden strip down the center. The fall from the box to the plate is 3½ inches. The apron-plate is mounted on a carriage, which can be pushed back, giving access to the battery, the 4-inch grooved wheels in front running on a half-round iron strip placed on the sides of the lower plate-frame. From the movable apron the pulp passes over 12 feet of plates, divided into three 4-foot sections, with a dividing strip down the center. Sixteen concentrators are used.

No. 19. *Tuolumne County.*—This mill presents some peculiarities in its construction. There are 10 stamps of 850 lbs. each, with steel shoes and dies. The stamps are given 100 drops per minute, dropping 4½ inches, with only 2½ inches discharge to commence on, through a No. 50 brass-wire screen. The rock-breaker (Wheeler pattern) and ore-bin are set on a rock foundation, the frames being entirely disconnected from the rest of the building, to counteract the vibratory motion of the crusher. In placing the mortar-block and mortar, the space around the block was filled in with concrete, and a double thickness of tanned belting laid between the block and the mortar, after which a fire was built in the latter until it settled into the belting. The wear of the shoes and dies is about 1 inch per month, and the duty of the stamps 1½ tons per stamp. When the dies are partially worn, a 2-inch iron plate is placed under them, to maintain a regular discharge. The inside of each mortar is provided with cast-iron side plates and a sheet-iron covered board at the back, to prevent wear on the mortar. The apron-plates are set 12 inches out from the mortar. The pulp from the battery passes over a 9-inch plate into double-pointed boxes of iron, bolted on the front of the mortar, and thence through a couple of 2-inch pipes to a spreader and to the silver-plated apron. The apron is followed by double sluice-plates, each 2 feet wide and 10 feet long, all set on a grade of 1¾ inches to the foot. Two-thirds of the amalgam is obtained from the battery. No concentrators are used.

(*To be Continued.*)

* Bulletin No. 6, California State Mining Bureau.

## Capital Invested in the Ore Business of the Lakes.

In July, 1892, the late George H. Ely of Cleveland, who first enlisted capital in the Vermillion iron range of Minnesota, which is now controlled by the Minnesota Iron Company, one of the largest mining corporations in this country, prepared a statement showing the capital invested in mining and transporting by rail and water to furnaces the iron ores of the Lake Superior region. Mr. Ely spent a large part of his time for several years previous to his death in the preparation of statistics relating to the iron mining business of Lake Superior and the commerce of the lakes. Since his death no effort has been made to supplement the statistics referred to by additions due to the development of the Mesabi range, the construction of new railways and docks in the Lake Superior region, building of new ships for the ore trade, etc. Before going to Washington last week, however, the *Marine Review* says Attorney Goulder of the Lake Carriers' Association concluded that these statistics might be brought up to date, and made available for arguments bearing upon legislation, by obtaining from ore dealers and vessel owners the best possible estimates of new investments in the various lines connected with the ore industry. After careful inquiry among ore dealers and reference to the *Inland Lloyds Register* and the files of the *Review* for the value of ships built since July, 1892, it was found that the investments in the various branches of the ore business now aggregate $233,242,085. The increase is mainly in the value of leases and fees on the Mesabi range, new ore railways in Minnesota and new docks at Duluth and Two Harbors. These figures seem enormous and can only be comprehended by those who have a knowledge of the capital required to mine and move to furnaces, in some cases more than a thousand miles distant, full 10,000,000 gross tons of ore in a single season of navigation, as was done in 1895. Or, the figures may be better comprehended by considering that 97,556,866 gross tons is the output of the mines since 1855, when the industry was begun. Mr. Ely's figures and the additions covering the period between July 1, 1892, and January 1, 1896, are contained in the following table:

| | Mr. George H. Ely's figures July 1, 1892. | Increase since July, 1, 1892. |
|---|---|---|
| Capital in mines in the four Lake Superior districts in 1889, as per United States census | $54,825,122 | |
| Increase to July 1, 1892 | 15,000,000 | $69,825,122 | $26,500,000 |
| Capital in docks and their equipments at Lake Superior and Lake Michigan ports, built and used exclusively for shipping ore (official) | 9,885,665 | 4,300,000 |
| Capital employed exclusively in railroad transportation of ore from mines to shipping ports on Lake Superior and Lake Michigan (official) | 27,014,594 | 5,350,000 |
| Floating capital on the lakes, employed exclusively in ore transportation, from upper lake ports to lower lake ports (estimated) | 29,933,107 | 16,747,100 |
| Capital in docks, and their equipments, for receiving and forwarding ore exclusively, at Lake Erie ports between Toledo and Buffalo, inclusive of both (official) | 12,392,880 | 3,100,000 |
| Capital employed exclusively in railroad transportation of ore, inland to mill and furnaces from Lake Erie ports (official) | 26,343,617 | 1,850,000 |
| Totals | $175,394,985 | $57,847,100 |
| Increase, July 1, 1892, to January 1, 1896 | 57,847,100 | |
| Total, January 1, 1896 | $233,242,085 | |

An American firm, which has just finished the connecting link of fifty miles in the chain of railroads encircling the island of Jamaica, has performed a great feat. The road runs entirely through mountains and morass. It has 27 tunnels, 193 girder bridges, 13 viaducts and 11 tower bridges. It is said that no such tremendous obstacles were ever met by engineers in a fifty-mile stretch. The cost will average more than $100,000 a mile.

## Testing the Ores.

To the uninitiated but observant stranger who wanders up and down in the labyrinth of shafts and tunnels, diggings and dumps of a genuine mining camp, perhaps there is no subject more full of interest than the process by which a lump of ore—which, to his inexperienced eye, looks not the least attractive—is made to yield its share of silver and gold, or the means and methods by which the mining man at his side so confidently assures him that a ton of that ore will go 82.33 ounces in silver and $17.55 in gold. Even the Eastern mining expert or graduate from some mining school will wonder how, in the log cabin or pine shanty, destitute of all the elaborate paraphernalia to which he has been accustomed, these results are so readily and accurately obtained.

As a general rule, the majority of the ores, except those containing the precious metals, for purposes of purchase and sale, are valued according to the cost of mining and shipping, so that, except for metallurgical purposes, it is unnecessary to seek to determine with much accuracy the contents and value of such ores. In the case of ores rich in the precious metals, however, it is entirely different, as in their purchase and sale both parties—the buyer as well as the seller—want to ascertain accurately and to a certainty the value of the entire lot. The methods by which this knowledge is obtained are so simple as to be easily understood and practiced by many a man who does not know the technical symbols of the metals he is determining or could not give a scientific exposition of the process; but, nevertheless, in his line, he is an accurate and successful assayer. When a quantity of ore is to be sampled, it is first broken by an ordinary rock crusher into pieces the size of an English walnut, after which it is shoveled back into the car, but in such a manner that every fifth shovelful is thrown aside by itself, the remaining four-fifths being finally taken away. This fifth portion, known as the "sample," is then reduced to a much greater degree of fineness by means of Cornish rolls. It is then piled on the floor in a cone, flattened out and divided into four equal portions, and two opposite quarters are then removed. The remaining quarters are again thoroughly mixed and again piled in a cone, flattened and quartered, this operation being repeated until the sample is reduced to 100 pounds. It is then weighed repeatedly for the purpose of determining the amount of moisture contained in the ore, which in some ores, especially those of the concentrates, is so considerable as to make a very appreciable difference in the weight. The moisture is then expelled and the ore is crushed to such a degree of fineness that it can be passed through a sieve containing 100 holes in the linear inch. The sample is next put up in small bottles, which are sealed with sealing wax and then stamped for the purpose of preventing the possibility of their being opened or tampered with without detection.

The above is the process of sampling used among the mines, and the sample is now ready to be assayed, but only a small portion of it will be used for that purpose, and the quantity generally taken is what is known as an "assay ton," which weighs 29,166 milligrams, or a little more than 450 grains Troy weight. The definite amount is taken, partly as a matter of convenience, and also because the assayer wishes to ascertain, as quickly as possible, how many ounces of the precious metals to the ton are contained in this ore. The method used depends upon the following principle: The avoirdupois grams ton of 200 pounds contains 29,166 ounces Troy weight; hence, when 29,166 milligrams of the unassayed ore are taken, the weight of the resulting "button" of gold or silver in the milligrams represents at once, without any further calculation, the number of Troy ounces of gold or silver in the avoirdupois ton of ore.

FIG. 3.—VIEW OF TURN STRUCTURES.—(See page 141.)

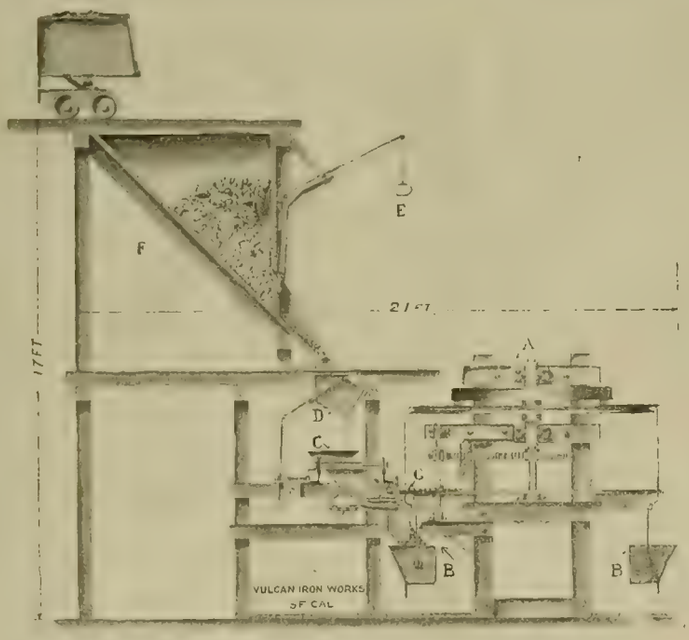

FIG. 4.—VULCAN AUTOMATIC LOADER.

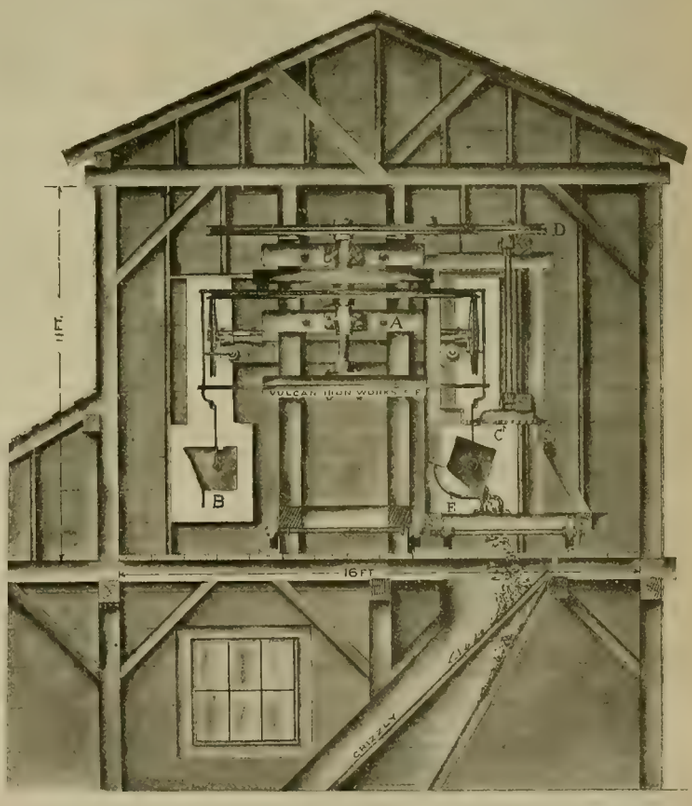

FIG. 5.—DELIVERY TERMINAL.

(See page 141.)

THE belief is common that a thorough chemical analysis will indicate precisely the character and quality of steel; yet those who are more familiar with such matters have long been aware that this is not at all the case, and it is a fact that two different brands of steel which will appear to be precisely identical, so far as the most rigid chemical analysis can show, will be totally different when put into service, and will give different results under physical test.—Machinist.

## Venezuela's Clear Title.

It was on the coast of Venezuela, says the Chicago *Tribune*, that Columbus first set foot upon the American mainland. This was in 1498, on the occasion of his third voyage in quest of a new world. By virtue of discovery and the conquest of the Indian tribes, which up to that time had been its only inhabitants, the country passed into the possession of Spain, and that nation retained undisputed control until the Venezuelans revolted in 1810. Venezuela had then grown to be quite a power. Its people were rich and brave, and, although of Spanish descent, rebelled against the exactions of the mother land. Long years of war followed; and while victory was virtually won in 1821, Spain was able to delay recognition of the independence of the country until 1845. With independence from foreign control came internecine trouble, growing out of the desires of various aspirants for political power and place, and there was a series of revolutions and civil wars lasting almost to the close of 1870. But during all this time no country, except England, thought of questioning the right of the Venezuelans to the possession of the land. The title is a clear one, so lawyers say. Spain obtained it by the discovery of the country and subjugation of the natives, and it passed to Venezuela itself when Spain, at the end of a long and bloody war, conceded independence to the colony and a republic was established.

ONE peculiarity of pearls is that, unlike other precious gems, they are liable to decay. Occasionally a valuable pearl changes color, seems to be attacked with a deadly disease and crumbles into dust.

## Magnesite.*

*Occurrence.*—Magnesite (carbonate of magnesia) occurs in several of the United States, but is mined commercially only in California. Some years ago a small quantity was taken from magnesite quarries at Goat Hill, Chester county, Pa., but the work was continued only a short time. In that State it also occurs at Low's chrome mine in Lancaster county, at Scott's mine in Chester county, and in Delaware and Lancaster counties in small masses. The other localities in the United States where the mineral occurs, but is not mined, are as follows: North Carolina—Webster, Jackson county; Hampton, Yancy county, and McMakins, Cabarras county; New York—New Rochelle and Rye, Westchester county; Warwick, Orange county; Stoney Point, Rockland county, and Serpentine Hills, Staten Island. In all these localities it occurs in thin veins and seams. New Jersey at Hoboken (with serpentine). In Arizona the mineral is abundant, but is not utilized.

The localities where the mineral occurs in California are numerous, but it has never been mined except at two places, one in Alameda and the other in Napa county. In Santa Clara county there are several known deposits. One is on Coyote creek, about two miles from Madrone station, on the Southern Pacific railroad. It occurs in the shape of small nodules in and near serpentine. In the report of the California State Mineralogist it is stated that a close examination of the magnesite, particularly the poorer quality, reveals traces of the surrounding country rock, greenstones and shales. There are several deposits in the immediate neighborhood. Another locality in this county is the Red Mountain district, where, on the Jarvis & Ryan claim, large, irregular masses of magnesite crop out, and in some places more than 10 feet are exposed. On the Favill & Martin, or Mammoth, claim there is a large quantity exposed. These Red mountain claims are twenty miles from a railroad, too far to be useful at present.

In Alameda county, on the shore of San Francisco bay, the mineral occurs at Cedar mountain, and a few tons were shipped from there in 1886, but the experiment was evidently not a success, as work has not been carried on since. The mineral has also been found in the hills near Livermore valley.

In Mariposa county a heavy bed of magnesian rock, chiefly magnesite[1] charged with crystals of iron pyrites, accompanies the chief gold-bearing vein of the county. The rock is associated with mariposite, a green micaceous mineral containing chromium.

In Fresno county, in S. 5, T. 13 S., R. 24 E., is a large vein or deposit of magnesite, which crops to the surface. At Arroyo Seco, Monterey county, a vein has been found 2 feet wide; and the substance has also been found at Mansfield, near the gold mines. About forty miles east of Visalia, Tulare county, a large deposit has been found near Mineral King district. In the same county, near Visalia, below Four creeks and Moore's creek, it occurs in solid beds of pure white mineral, hard and fine-grained, like unglazed porcelain. The beds are from 1 to 6 feet thick, interstratified with serpentine and talcose slates. In this same county it is also found on the south side of the Tule river, ten miles from Porterville. In Placer county magnesite occurs in quantities at Gold Run, Iowa Hill, and Damascus, in the same region as the large hydraulic and drift gold mines. In San Luis Obispo county it has been discovered near Port Harford.

The mineral is also known to occur near Los Alamos, Santa Barbara county; at several places in Humboldt and Napa counties, and in San Mateo, Lake, Tuolumne, Sonoma, Solano, Contra Costa, San Bernardino and Calaveras counties in isolated instances. In none of these places mentioned, however, is the mineral now mined.

In 1886 work was commenced on the deposit at Cedar mountain, Alameda county, and several carloads were shipped, but work has been stopped for some years, the experiment not proving a financial success. The mineral occurs here in a decomposed serpentine rock and in a yellow clay, in which are embedded large boulders. It lies in pockets and small veins, the latter running in every direction. The richest spots were found under the boulders, where the mineral is quite pure. At this place every piece of mineral had to be cleaned by hand, and the whole was carefully sorted according to purity, being divided into three classes. It was then packed on animals down the mountain.

*Production.*—The only deposit in California which has been utilized to any extent on a commercial basis is that in Childs valley, Napa county, ten miles from Rutherford and sixty-five miles from San Francisco. Here the mineral occurs in a lode 5 to 7 feet thick, standing at an angle of 70° and having regular walls. Most of the deposits found elsewhere occur in beds from 2 to 6 feet in thickness. This lode consists of a white carbonate of magnesia, the mineral being broken out in slabs several inches thick and from 2 to 6 feet in width. The output from this mine is employed in the manufactures and the arts to some extent, and experiments are being made for its larger utilization in new branches. The main uses to which it is put at present are for furnace linings at rolling mills and for paper manufacture. Small lots are used in experimental work in the manufacture of artificial stone, paint, epsom salts, flocculent magnesia, and other chemical processes.

The product of this mine for the past four years has been as follows:

| CONDITION IN WHICH SOLD. | 1891. | 1892. | 1893. | 1894. |
|---|---|---|---|---|
| | *Pounds.* | *Pounds.* | *Pounds.* | *Pounds.* |
| Raw ore | 234,440 | 1,215,155 | 526,685 | 2,880,000 |
| Calcined ore | 643,748 | 794,085 | 880,613 | |

In these figures only the raw ore is named which was sold as such, the rest of the output having been calcined. It takes nearly two tons of the raw ore to make one of the calcined. Of the last season's output all but fifteen tons of the calcined material was used by the Willamette Pulp and Paper Co., Oregon. About 100 tons of the raw ore was used by the Pacific Rolling Mills, of San Francisco, for furnace lining.

The mill and furnaces at the mine can readily be enlarged should demand for the calcined ore warrant. At present Chicago and Pittsburg obtain their supplies from New York and other Atlantic seaports, into which it is imported from Europe. In Pittsburg and other large manufacturing centers dolomitic limestone is employed in making basic steel. For this stone magnesite would be substituted if it could be obtained at prices somewhat lower than now has to be paid for the imported calcined material, on which there is imposed a duty of twenty per cent, the raw coming in free. There is an abundance of this ore in California, as may be seen from the number of localities noted, but distance from large manufacturing centers prevents shipment under present conditions.

*U. S. Geological Survey: Sixteenth Annual Report, 1894-95.

1 According to Prof. Silliman (Proc. Cal. Acad. Sci., Vol. III, p. 380), the magnesian mineral accompanying the great quartz vein of Mariposa county is chiefly ankerite, a carbonate of calcium, magnesium, and iron.—H. W. T.

## The Great California Gold Belt.

DAN DE QUILLE, in the Salt Lake *Tribune.*

In the "mother lode" of California we have one of the greatest gold belts known in any part of the world; indeed, probably the very greatest now known. There, extending along the western slope of the Sierra Nevada range for a distance of 120 miles, and having a width of twenty-five to thirty miles, we have a great mineral belt, within which is found a wonderful system of gold-bearing quartz veins. The immense auriferous belt follows the trend of the main Sierra Nevada range, and within it are found parallel veins of quartz of all sizes, which have the same general course. Very many veins show upon the surface, having been exposed by the wearing away of the mountains in the course of ages, but there are doubtless as many more that erosion has not yet reached and brought to light. These deep-lying veins are frequently discovered during the progress of underground work in the mines of the old producing camps, and they doubtless exist everywhere along the great belt.

The placer deposits of California were the greatest and richest of any of which we have reliable data, or even vague traditions, and as all the hundreds of millions found in these—not to speak of what still remains in the deep diggings—came from the quartz mines of the big gold belt, we need not doubt the existence of untold auriferous wealth at the source of supply. The quartz miner could ask for no better indication of rich lodes above in the mineral belt than is to be found in the immense amount of gold thrown off by them and scattered far and wide over the country below. The gold thus scattered came from quartz veins through the processes of decomposition and erosion. It first found its way into the streams of the ancient river system, then was to a great extent swept away, spread abroad and redeposited by the present creeks and rivers of the country.

Of course, no one knows to what depth the quartz veins at and near the surface were worn down—whether ten feet, fifty feet, or a hundred feet—but we may safely calculate upon the greater part of their golden contents being still in the remaining undisturbed sections of the lodes. The gold lost from the veins was merely that dislodged and scattered through the action of the elements and the changes incident to the seasons and the occasional wild freaks of the uneasy earth. As we see gold-bearing quartz veins being worked to the depth of 2000 feet and over in the older camps of California, with no diminution in the quantity or quality of the ore obtained, no one need fear the permanence of the veins on the mother lode system. The hundreds of millions thrown off and scattered in the placers are the best possible indication of the richness of the veins above.

One would imagine that the very first thought of a miner of any experience, on seeing the immense amount of gold sown broadcast in the placers, would be to seek the source of so much wealth, but when the idea of the golden fountain head being somewhere above in veins of quartz first occurred to the average California miner of the early days he had too good a thing where he was in gathering the gold which nature had through the ages washed down and deposited in the creeks, gulches and river bars ready to his hand and easily secured. The few who did rush up into the wilds in search of the source of the placer gold came back with dismal reports. Instead of finding huge reefs of almost solid gold and digging out the metal by the ton, or at least by the pound, as they had anticipated doing, they had only been able to find here and there a vein from which they could pan out prospects of a few cents.

Such reports coming from the quartz veins up in the mountains gave the "sources of gold" a "black eye" and soon thoughts of a great fountain head became mere dreams of the past. Many began to believe that the golden nuggets were blown out of volcanoes or that they grew, like potatoes, where they were found.

When at last some work began to be done on the quartz veins it was mostly by a class of new-comers. The drilling, blasting and battering at flint quartz with sledges and poll-picks did not suit the old miners. Their easy gains of gold in the gravel of the creeks and flats had spoiled them for the more difficult and less romantic work of quartz mining. As there were still places where paying gravel was to be found, the old-timers clung to the placers. They would rock out little patches of ground, scrape old bedrock—anything but turn quartz miners. No fun in that.

Thus it has happened that California's big gold belt—the greatest in the world—is so little developed. The placer mines lasted too long. They were so extensive and rich that in the many years required to exhaust them—or those most accessible—the grand source of all the gold they contained was almost forgotten; at least, save in a few instances, was neglected in a manner that now begins to strike us as simply astonishing.

But now, at last, there is a general awakening to the great value of the big California gold belt and its wonderful system of veins of auriferous quartz, the source of the hundreds of millions of gold found below in the placers. Men of means are securing properties in many places on and along the line of the mother lode, and soon the new producing mines will be numbered by scores. For their encouragment the new beginners have but to take a look at what is being done in some of the older camps, where quartz mining was commenced by a few more than three decades of years ago. At Nevada City, Grass Valley, Angels and other old mining towns are to be seen some of the richest and best paying mines now in operation in any part of the world. The many years that a number of these mines have been worked affords the best evidence as to the persistence and richness at depth of the veins of the mother lode gold belt.

## The Anti-Debris Association.

The Executive Committee of the Anti-Debris Association held its monthly meeting in this city yesterday, at which the reports of Manager Phipps and the watchmen employed to keep track of hydraulic mining operations were read.

These reports show that some hydraulic mining is being done on the American and Yuba rivers without permits, and that several dams, in addition to those heretofore reported, were washed out or injured by the storms of January. The Henning's dam in Placer county, the Wolf dam in El Dorado county and the Valentine and Gardner Bros.' dams in Shasta county, were entirely ruined.

The attention of the California Debris Commission had been called to these conditions of affairs.

The photographs of dams taken by the association have been distributed as educators on the insufficiency of dams.

The report of the attorney for the association shows the present condition of the suits in court commenced by the association, or in the prosecution of which it is assisting, and also correspondence on matters pending in Congress.

The Legislative Committee, through Mr. Ohleyer of Sutter county, submitted a report of its correspondence and work.—Sacramento Record-Union, 19th.

## Internal Heat of Mines.

In last week's issue, page 129, was published an interesting article on "The Internal Temperature of Rocks," showing that in the deep levels of the Calumet & Hecla the usual claims that the internal heat of the earth increased 1 degree for every fifty feet of vertical depth does not hold good. It is further ascertained that the exact temperature at the bottom of the Red Jacket shaft, a depth of 4375 feet, when the drilling machines are working is 78 degrees, and when the machines are shut down, and have remained shut down for some time, the temperature does not exceed 81 degrees. There are places in the Calumet & Hecla where the thermometer registers 105 degrees, and even 108 degrees, but this is in the pump rooms at the eighth, sixteenth, twenth-fourth and thirty-third levels of Nos. 4 and 5 shafts, and this excessive heat is caused not by the internal heat of the earth, but by the big 4-inch steam pipe which carries the steam from the boiler house on the surface to the various pumps underground to the last one on the line, 3300 feet below the surface. Even at that great depth there is a pressure on the steam chest of the pump of 125 pounds.

### Modification of the Chlorination Process.

Bruno Mierisch of Managui, Nicaragua, has devised a modification of the chlorination process to prevent injurious effects of the residues of the sulphur, arsenic and metallic oxides in oxidated and roasted ores by the hypochlorites and chlorates of the alkalies and alkaline earths, by mixing the ores with a calculated quantity of sodium hydrate and adding as much calcium hydrate as is necessary to separate the thus obtained sulphuric acid and arsenic acid in the form of insoluble calcium salts, and thus prevent the deterioration of the sodium chloride lye by sodium sulphate.

The ore is pulverized as usual to such a state of fineness that no residue is left on a forty-mesh sieve and dampened with a lye containing twenty-five per cent of common salt to such a degree that small balls can be made of it with the hand—60-70 liters of lye is required per ton of ore. This done the ore is put in fixed chambers of one-half meter height and about the same length and there exposed to the action of chlorine gas. If the ore absorbs a considerable quantity of chlorine—but not so much that it would be advisable to roast it before in order to reduce the consumption of chlorine to a reasonable amount—it is best to add a small quantity of lye of caustic soda, or if the consumption of chlorine is caused by the sulphur contained in the ore, slacked lime, preventing in this manner the forming of acid in a free state, as by such acids part of the worthless metals would be dissolved.

The chlorination chambers are simple boxes covered on the inside with sheet lead. They contain two openings, one on the upper side for putting in the ores and one on the lower side for taking them out after the chlorination is over. The time which the ore has to be exposed to the action of the chlorine gas is not a fixed one; it is determined by the nature of the ore that has to be treated. Ore on which the action of chlorine is slow requires several chambers for chlorination in use at the same time in order to be able to treat the same amount of ore. As, however, the first cost of these chambers is extremely small and the place they occupy is also not very great, as they can be put above each other where space for the establishment is limited, the cost of these chambers can never come in consideration where the application of this process is advisable.

In general the time required for treating the ores in the chambers with chlorine gas is less than twenty-four hours as in consequence of the presence of the hydrate of sodium, the mass of ore after the gas is introduced in the chamber heats itself and the subchlorides of sodium or lime in statu nascendi act energetically.

After the chlorination is finished air is introduced at the upper end of the chamber in order to expel the chlorine gas; the ore is taken out through the opening at the lower part of the chamber and falls in the conveyor provided there for its being carried off. Directly above the opening at the lower end of the chamber a conduit with an absorber is placed in order to carry off the gas that always will rise from the treated ore, and protect in this manner the workingman against the obnoxious effects of the chlorine. The air mixed in this way with chlorine can, either in order to regain this gas or in order to avoid reclamation from neighbors, be conducted through a box where hydrate of lime is stored in trays placed above each other. The absorbed chlorine forms with the hydrate of lime subchloride of lime, which is used again in the process instead of the hydrate of lime, as it is stated in the document describing the patent, where it is shown at the same time that the chlorine is regained in this way in active or gaseous form.

The chlorinized ore is carried by the conveyor into tanks provided with an apparatus to stir it up continuously; at the same time such an amount of a concentrated solution of salt is added to the mass in the tank as to form a thin paste. After this a lye of salt containing hydrate of sodium is added, until the whole gives a slight alkali reaction, and to this is added again chlorine in the form of a solution of salt saturated with chlorine until the alkali reaction has disappeared.

The addition of hydrate of sodium is made in order to separate copper, iron, lead and zinc that may be contained in the solution, in the form of hydroxides; at the same time arsenic and antimony are separated in the shape of salts of these metals or of lime. If too much hydrate of sodium is added part of the oxides of lead and zinc is dissolved again, and for this reason the alkalic reaction has to be neutralized again by the addition of chlorine, by which operation the hydroxides of lead and zinc will be finally separated. The lye of salt after this can contain only the chlorides of quicksilver, gold and platinum. During the whole of this operation the ore is continuously stirred.

The tank has the same form as the agitator used in the amalgamation process; that is to say, it is a simple round wooden tank with a stirring apparatus. In order to protect it against the attacks of the chlorine it must receive, before used on its inside, a coat of asphaltum or a thin covering of sheet lead. In the bottom of the tank quicksilver or amalgamated copper plates are put, which are connected with the negative pole of a dynamo or accumulator, while the arms of the stirring apparatus are connected with the positive pole. Through the arms of the stirring apparatus in this way continuously a weak electric current is flowing towards the quicksilver, which separates the precious metals contained in the lye, and these in their place are amalgamated by the quicksilver. On the suspended hydroxides and particles of ore the current has no effect whatever, while the coarser particles of metallic gold and silver are amalgamated by the quicksilver. The paste of ore flows through three or more tanks, to give the electric current sufficient time to act upon the chlorides contained in the paste.

The paste of ore from which all the precious metals are extracted is carried off to a centrifugal rotator, a filter press, where the lye is separated from the ore residue. This residue will retain, according to the pressure exerted on it, more or less lye; under ordinary circumstances this might be 50 l., and these 50 l. will contain 12.5 kgr. of salt. If chloride of sodium is cheap, but fuel expensive, the residue of ore is thrown away in this shape; but if the reverse is the case, the residue is washed again with water and this diluted lye concentrated again until it contains twenty-five per cent of salt.

The lye of chloride of sodium without further cleaning is used over again in the process, as a small amount of subchlorides offers no disadvantage whatever to electrolytic treatment, and by adding it to the powdered ore it only has a beneficial effect, as it replaces an equivalent amount of chlorine. It is not necessary, when the lye is separated from the residue of the ores, that it should be absolutely clear, as it does not contain any precious metals and only serves to make the powdered ore liquid; but the part of lye which is used in the electrolytic process must be free from slime. With clayey ores the separation of liquids from ores is extremely difficult, and very often can only be effected by submitting the ore to a clear red heat before treating it by a lixiviation process.

The amalgam is treated afterwards in the usual manner. The product containing the precious metals will be pure, as the lye from which it was precipitated could not contain copper, lead, zinc nor arsenic and antimony. The separation of the gold from silver is effected in the best way by means of chloride gas, after the process of Miller.

### The Dog-in-the-Manger Policy.

Finally the *Democrat* has compelled the managers of the Anti-Debris Association to define their position relative to the betterment of the Yuba and Feather rivers, the same having appeared in these columns yesterday. Briefly stated in condensed form, they are opposed to any work being done other than such as meets the approval of their attorney, Mr. Devlin, and themselves. And they are opposed to the pending appropriation in Congress to be expended under the direction of the Government engineers because they fear it may benefit the miners, who would get $250,000 of State money to be expended under the direction of the State Debris Commissioner, John F. Kidder of Grass Valley. In other words, they are in favor of a policy of obstruction and prefer to see our rivers fill up year after year and to continue to draw money monthly from the treasury of Yuba county rather than to see a restraining wall at Deguerre Point. This is the position of the men who claim the name of State Anti-Debris Association.

Now let us see who they are and how many of them stand on this platform of obstruction as outlined in the communication published in the *Democrat* yesterday.

There are only four counties represented in the association; nor has there been any more during the two years last past. These are Colusa, Sacramento, Sutter and Yuba, and they pay $200 a month each to pay the salaries and expenses. There are two members from each of the four counties, who are styled the executive committee, and one member of each Board of Supervisors, who are to see that the money of the taxpayers is not improperly expended. The whole number is twelve, and a majority can rule, and they do, particularly in the present opposition to the appropriation mentioned, as two of them, at least, are in favor of it. Now, to put it mildly, this is a case of the tail wagging the dog of the most pronounced and malignant form.

There is another organization of the same kind called the Sacramento Valley Anti-Debris Association, having representatives from the same counties and just as strong, numerically, as the other.

These gentlemen recently met and adopted resolutions in opposition to dams to facilitate hydraulic mining, but they are not obstructionists who oppose an appropriation to perform work in the betterment of Yuba and Feather rivers. The so-called State organization draws from the four counties $10,000 a year, all of which goes for salaries and expenses. The Sacramento Valley Association has not drawn any money from the treasury of these counties in two years, yet in the matter of betterment of these streams the last-named association has been just as successful as the other, except that they have not taken any photo views of holes in abandoned dams. But the real live question now is, how long will the people remain passive and not make an effort to obtain an appropriation to be expended in the betterment of these rivers?—as it is time to fish or cut bait.—Marysville Democrat, 18th.

### Thinks Them a Good Investment.

D. B. Huntley, of Telluride, Col., talking of the silver mining outlook, says:

"Now is the time to buy up silver mines, tie them up and salt them down. For any one who has money to spare, the investment in silver propositions is the very best thing one can engage in. Silver is about as low as it will ever be as bullion, and any marked change will be for the better. In the first place it cannot be mined at as low a figure as it has been in the past; for one reason, because the big deposits of rich silver ores are not found near the surface as in the past. Then again, the modern appliances and inventions do not cut so much of a figure in the cost of smelting silver ores as one naturally supposes. The smelting of silver ores is as old as the bills themselves, and the improvements are not so great as the industry itself. It is mostly a matter of deep mining, too, nowadays, and deep mining adds to the cost of production. But that is not all. The use of silver in the arts and manufactures increases with civilization, and furthermore, as the population and civilization of Asia increases so will the demand for the white metal increase. The United States will have to supply the demand; for while Central and South America have rich silver mines, it will be many years yet ere they will be in a position to make an output to compete with the mines of North America. All of these conditions are outside of the free coinage issue. If the free mintage of silver is granted, it will be that much more of a step toward the rehabilitation of the silver industry, and for my part, if I had to have a property that at the present moment was unproductive, I would prefer to have a silver property. At no distant day it is bound to be a paying proposition. After all this turmoil is ended and the national financiers can see 'where they are at,' it will be concluded that the remonetization of silver is the only road to a sound money system, and steps will be taken to get there. Then will come the chance of the owner of silver mines. There is no use talking; silver must be one of the moneys of ultimate redemption, and it will be placed on a parity with gold. The United States cannot have prosperity without bimetallism, and bimetallism we must have. Therefore, I say, a good silver mine, even if not now paying, is as good a holding as any other non-productive property."

### Preliminary Announcement 29th Industrial Exposition, Mechanics' Institute, 1896.

The Mechanics' Institute announces that its 29th Industrial Exposition will open to the public from Tuesday, September 1st, to Saturday, October 3rd, 1896, inclusive. The feature of the forthcoming Fair will be an exposition of the industries of California, to which end the efforts of the managers will be specially directed.

The Mechanics' Institute is and always has been the earnest exponent of "home industry," and the experience of the past will be joined to the energy and enterprise of the present in making this feature the controlling and predominating one in the 29th Exposition.

Although recent industrial expositions have adopted rules which entail directly or indirectly heavy expenses on exhibitors by charging for space, power, etc., the Mechanics' Institute sees no reason why it should deviate from its practice of allowing exhibitors to enter and maintain acceptable exhibits free of charge, and the Board of Trustees of the Mechanics' Institute announce that as heretofore there will be no charge for space, power, water, or general lighting, and that all exhibitors will be placed in this respect on the same plane.

The Exposition building is situated in the heart of the city of San Francisco, adjoining the City Hall, and is reached directly by all the car lines, and is within fifteen minutes' ride of all the ferry and railroad stations.

It occupies an entire block of land, and is surrounded on all sides by wide streets. It has a floor area of 150,000 square feet; the main nave is 412 feet long, 100 feet wide, 80 feet high, and has a promenade gallery surrounding it 825 feet long by 16 feet wide.

The building will be brilliantly illuminated during the evening and admirably lighted during the day.

Ample power will be supplied exhibitors without charge, including all necessary shafting, pulleys, etc.

Orchestral music by a band of sixty of the best musicians under the most distinguished leader the country possesses will add to the other attractions of the Exposition.

The art gallery is 280 feet long and 50 feet wide, and will be made a source of especial attraction to visitors.

The restaurant and cafe will be in charge of a responsible and experienced caterer, and all other necessary conveniences and comforts for visitors and exhibitors will be provided.

A telephone and telegraph exchange will be established in the building, as also a reading-room supplied with all the current newspapers.

There will be no better opportunity for the manufacturers and producers of California to place in an advantageous manner before those interested, and the public at large, the result of their skill and industry, as the purpose of the management is to make this essentially a grand Exposition of California's Industrial and Natural Productions.

These Expositions held by the Mechanics' Institute are, and always have been, exceedingly popular, as from 250,000 to 400,000 visitors from all parts of the Pacific coast and abroad have attended each fair, the building being crowded afternoons and evenings.

Communications will be addressed to J. H. Culver, Secretary Twenty-ninth Industrial Exposition, 31 Post St., San Francisco, Cal.

By order of the Board of Trustees.

A. S. HALLIDIE, President.

ERNST A. DENICKE, Recording Secretary.

San Francisco, Feb. 20, 1896.

# Scientific Progress.

### Effect of Using Corrugated Glass.

It has frequently been found in large factories where the rooms were broad that insufficient light was obtained on either side between the windows. It has recently been discovered, however, that, if the glass used in the sashes be ribbed or corrugated instead of flat, the light will be diffused much more effectively. Some experiments tried by Charles L. Norton, of the Massachusetts Institute of Technology, with different specimens of this glass, show that about twenty ribs to the inch give a better effect than a smaller number. Of course, one cannot look through such windows. At a short distance they appear like ground glass. It has been suggested that, where the employes are likely to object to the loss of view thus occasioned, it might be well to put clear glass in the lower part of the window and ribbed glass in the remaining portions. It seems to be necessary to use panes which are rather thicker than those of clear glass, and, consequently, heavier. On this account it may be well to have the greater part of the window stationary, with a sort of transom above, for ventilation.

Ordinarily, daylight comes into a window and strikes the floor slanting, at an angle of about forty-five degrees. A big bright patch can be seen on the floor opposite each window. From this spot some light is reflected upward, and then a still smaller portion is thrown down and scattered about the room by the ceiling. But if ribbed glass be substituted for the plain kind, the bright patch on the floor disappears. The light is spread out into a fan-shaped beam, reaching far around on each side. This expanding effect is sideways if the ribs run up and down, as they ought to; but if they run horizontally, the diffusion is upward and downward. But the latter arrangement is undesirable, because the glass itself, in that case, acquires a brilliancy painful to the eye. The effects attributed to the new glass by scientific men are almost incredible. Even directly in front of the window the amount of light apparently received is almost trebled; and well around on the side, at an angle of sixty degrees, it is about doubled. It is not alleged that more light actually enters, but that the distribution is such as to give these results, if special light-measuring instruments be used for tests a few feet away.

### Revealing Hidden Solids.

Further particulars of Prof. Roentgen's method of photographing objects under the influence of electric radiation, solely, are awaited by the whole scientific world with some interest. It is now stated that one experimenter has succeeded in obtaining pictures through an intervening medium consisting of aluminum plates an inch thick. This statement, pending the receipt of more exact information, must be accepted with caution. There seems little reason to doubt, however, that vacuum tube lighting makes it possible to photograph through opaque bodies, and this discovery has evidently been prepared by the demonstration of the penetration of the Hertzian waves through various bodies. It is suggested that if all that has reached us by cable be true, there will no longer be any privacy in a man's home, as any one armed with a vacuum tube outfit can obtain a full view photograph of any interior through a brick wall. Possibly an indispensable part of the construction of the house of the future will be a photograph-proof screen. Medical men are already discussing the probable effect of the new discovery in their profession. They propose, with different strengths or gradations of the radiant energy, to bring different substances or structures into view in any part of the body. Thus, with one strength they hope to detect metals; with another, bone or bony tumors; with a third, the various kinds of degeneration to which the structures of the body are liable. For instance, solidified parts of the lung where the structure may have shrunk away may be made apparent. In the heart may be detected the difference between fatty degeneration and brown or amyloid degenerations. Applied to the abdominal cavity, the new process may be used in the discovery of tumors, abscesses, hardened parts of the liver or other abdominal organs, and very possibly calcareous deposits in all parts. In the treatment of gunshot wounds its value would seem to be unquestionable.

### The New Photographic Process.

The possible uses of the new process of photography, in determining the existence of secret flaws in metals, is about to be tested thoroughly at the Carnegie works, where a large amount of naval armor construction is under way. Proper apparatus has been secured, and experts there are now at work to demonstrate whether or not rays will penetrate bodies of metal. If this can be done the importance of this process from an industrial standpoint can scarcely be overestimated. It will be possible to secure an exact knowledge of the nature of the metal of great guns without running the risk of explosion, and the defects in the shafts of ocean steamers can be discovered before the shafts break and thereby cause loss of life and property, and steel castings used for structural purposes can be accurately tested before being put in place.

By way of showing the effect of improved methods upon prices, Lord Playfair stated at a technical education meeting in England, that since 1856 aluminum has fallen in value from $90 to 50 cents a pound. Simultaneously, nearly all machine-made commodities have cheapened by 30 per cent; and the cost of transport has been so far reduced that the flour in a quarter loaf is brought 4000 or 5000 miles for 1 cent. These declines are attributable to the advance of science, through whose istrumentality we are now enabled to do with comparatively little trouble that which formerly required the expenditure of much energy.

# Mechanical Progress.

### Hardening Steel.

Consul Monaghan, of Chemnitz, reports to the State Department that the Germans are interested in a new process for hardening steel by means of gas. The invention originated with the famous French steel and iron firm, Schneider & Co., of Creuzot. It is a well-known fact that gas, under great heat, deposits carbon in solid form. Upon this depends its light effects and also the formation of the so-called retort graphites, a thick covering of pure carbon on the walls of the gas-light retorts. The gas that strikes the retort walls deposits parts of its carbon upon them. This is the fact on which Schneider based his invention—a process for cementing together (uniting) steel armor plates.

It is said to be very important in the production of armor plates to have them comparatively soft inside and hard outside. This hardening is obtained by the application of carbon. Formerly the process of hardening consisted in covering the plates with layers of coal and heating them till they glowed. Schneider's process puts two plates into a furnace, one on top of the other, with a hollow space between. This space is made gastight by means of asbestos packing put on around the edges, and the plates are heated red hot, while a stream of gas is poured into the hollow space indicated. The carbon thrown out by the gas is greedily taken up by the glowing plates until they are thickly covered. The depth of this carbon covering can be regulated by the amount of gas admitted. In order to secure regular and uniform action during the process, and to prevent the pipes that carry the gas to the hollow space from absorbing any of the carbon, they are insulated in other pipes, through which water is constantly circulating.

### A Big Leak.

In a recent lecture before a Marine Engineers' Institute, Professor Weighton said that the economy of propulsion in steamships divided itself into two parts: (1) So far as it related to machinery, the friction of the mechanism, the maximum horse power, the fuel. (2) The form of ship which would give the least resistance in carrying a given dead weight at a given speed, with a maximum amount of power. He would only deal with the first. We had nothing to boast of as regarded the efficiency of modern machinery. If we reduced one pound of coal to horse power we would have 327 horse power, and for every pound of coal we burned we ought to get, if the machinery and the boiler and the furnace were each fulfilling their purpose with perfection, 327 horse power; what we actually got was 17⅞ horse power. Prof. Weighton then illustrated by diagrams representing disks, the various approximate losses of power from the boiler to the propeller. The first disc, or the pound of coal, represented 327 horse power; the second disk, the boiler, 216; the third disk, the engine, 34½; the fourth disk, 29⅛, and the fifth disk, the screw, 17½. He showed how these various losses of power accrued—namely, at the furnace by the radiation of heat, by latent heat, and by heat passing off in the form oxide. Friction was another medium which minimized the power. He pointed out the difference between Welch coal and Newcastle and Scotch coal, and the best methods to burn them. The coal, required, he said, for 1000 horse power was thirty-six tons per day, but if the machinery utilized all the latent heat in the fuel, we would only require about two tons.—The Engineer.

### Soldering Glass.

Recent investigations pursued by Margot have established the interesting fact that an alloy composed of ninety-five parts of tin and five of zinc melts at 200°, and becomes firmly adhered to glass, and, moreover, is unalterable and exhibits a most attractive metallic luster. He has further ascertained by this experiment, that an alloy consisting of ninety parts of tin and ten of aluminum melts at 390°, becomes strongly soldered to glass, and is possessed of a very stable brilliancy. With these two alloys it is possible, it is claimed, to solder glass as easily as it is to solder two pieces of metal, and this operation may be done by soldering the pieces of glass, when heated in a furnace, by rubbing their surface with a rod of the solder, the alloy as it flows being evenly distributed with a tampon of paper or a strip of aluminum — or an ordinary soldering iron can be used for melting the solder.

### Why Presses Are Succeeding Hammers.

The great steam hammer at the Bethlehem Company's works in Pennsylvania is at this time the largest one ever made. It is single-acting, that is, the falling movement or blow is by gravity alone. The falling weight is 125 tons, and the range 16.5 feet. The whole structure is 90 feet high from the floor, and the foundations extend 30 feet below, so the whole height is 120 feet. The piston rod is of steel, 16 inches in diameter. There are in use two other hammers of 100 tons, one at Creuzot and one at Rive de Gier, France, and one of 109 tons at Terni, in Italy. The next largest is 80 tons at St. Chamond, France.

The largest double-acting hammer is at Aboukoff, in Russia, rated at 50 tons, but this rating will not do to compare with gravity hammers. The blows may equal in force 100 tons falling only. The great hammer at Bethlehem is outdone by a hydraulic forging press recently erected there that exerts a pressure of 14,000 tons. The force is not accumulated, but is direct by steam pistons acting on the water with a force estimated as equal to 16,000 horse power.

If the effect produced by these vast engines could be accomplished irrespective of speed or velocity there would be no need of such great weight, but an element of time enters into these forging processes, necessary because of inertia in large masses to be reduced, and also because some time must be allowed for the heated metal to flow when under pressure. This is more nearly attained by a heavy weight falling slowly.

The increase of hammers to the enormous proportions named is to acquire this time required, the principle culminating in the forging presses, more commonly employed all over the world for heavy work, especially in England, where hydraulic apparatus has attained great development. The presses acting slowly permits the metal to move uniformly throughout, or "to the center," as it is called, while a quick blow acts only on the surface.—American Manufacturer.

# Electrical Progress.

### Making "Scorchers" of Some Use.

Among the recent developments to which the widespread use of the bicycle has led is a machine for enabling the cyclist to train or take advantage of his exercise indoors in bad weather. The rider sits in the saddle and works the pedals in the usual way, and while the wheels revolve, their force is expended on the turning of an endless belt, and the bicycle never moves from the spot. It has occurred to a French electrician that some useful work can be done at the same time. He has accordingly designed an apparatus in which the driving wheel of a safety bicycle of the usual type is raised from the floor and, by means of a strap and speed gearing, made to drive a small dynamo, which is used to charge accumulators. This idea of turning exercise into a useful product outside of its own special purpose, is capable of wide application. One instance of it will be readily remembered. Nansen, in fitting out the Fram for his Arctic expedition, had a capstan placed on deck, the shaft of which was connected by gearing with the ship's dynamo. The object of this was that in the long, dark winter of the polar regions, the crew should take daily the exercise needed for health, by doing their shift at the capstan, and at the same time generate the electricity needed for lighting the ship. In some English prisons, where the energy derived from the working of the treadmill by the convicts has hitherto been insufficiently utilized, it is now proposed to turn it to the generation of electricity for lighting the buildings, making the prison industries more remunerative, and giving the prisoners a training which will enable them to live honestly when they are discharged.

Much comment has been excited by the putting into practical shape of an idea that talking machine makers have been long commending to the public. A Congressman is using the phonograph for the reproduction of speeches in which he wishes his constituents to be abreast of his political work. He finds he can thus address them in a distant city without neglecting his duties at the national capital. After the speech is uttered into the transmitter of a phonograph, the cylinder is removed, shipped to its destination by express, and placed in an instrument with a megaphone attachment at the other end, where the speech can be listened to by a large assemblage, and repeated, if necessary. It is suggested that the telephone could be employed for still more direct delivery of Congressional eloquence. It might even be used to enable every con-

stituent to hear his representative's speeches as they are uttered on the floor of the House.

### Success in Electrical Engineering.

The question, "Are we educating too many electricians?" has brought out a great number of replies, most of which are in the affirmative. One professor while believing that too many electricians are now being educated in this country, is convinced that the electricians turned out of many institutions owe much of the tardiness, if not absence of success of their efforts, to the fact that they are not properly equipped for their work. The tendency in some colleges is to concentrate the students too much on the theoretical side of their preparation, to the manifest detriment of their practical training. This practical training he would make as wide and as thorough as it is possible to make it. To show this, he relates an instance that came within his knowledge. At Cornell all the mechanical engineering students have to learn seven trades. One of these trades, that of a blacksmith, is very distasteful to some of the students, but it has to be learned, all the same. One young fellow, who was unusually averse to soiling his hands, begged hard to be exempted from wearing the leather apron, but the professor took special care that there was nothing lacking in the thoroughness of his training at the forge. Last fall, the student went to the professor and thanked him for being compelled to learn blacksmithing. "You see," said the former dude, "I am now superintendent of a mine away back in Colorado. Last summer our main shaft broke and there was no one in the mine but myself who could weld it. I didn't like the job, but I took off my coat and welded that shaft. It wasn't a pretty job, but she's running now. If I couldn't have done it, I'd have had to pack that shaft on mule back and send it 300 miles over the mountains to be fixed, and the mine would have shut down till it got back. My ability to mend that shaft raised me in the eyes of every man in the mine, and the boss raised my salary.

THE Attorney-General of Ohio has decided that electric roads in that State, carrying passengers, express and mails, "are under the jurisdiction of the Railroad Commissioner and subject to the same regulations that govern steam railroads."

## Practical Information.

### Some Mile Recods.

A mile is not a thing requiring such an extraordinary time to cover, provided the coverer of it is properly equipped with a sufficiency of speed-producing powers. Below is given a partial list of some exceedingly speedy milers and their performances, and some slow but sure travelers as well:

Light—0.000005102 of a second, or 196,000 miles in one second.

Electricity—0.00000347 of a second, or 188,000 miles per second.

Earthquake—¼s., as calculated by delicate instruments, or around the world in 3½ hours.

Sound in Water—1s., or 4,900 feet in one second.

Cannon Ball—1 1/5s., if it traveled at the muzzle velocity of 3,300 feet per second obtained by some guns.

Sound in Air—5s., or 1090 feet in one second.

Birds—18s. It is said the frigate bird flies 200 miles an hour; a mile in 24s, by the kestril, or sparrow-hawk, which is said to fly 150 miles an hour; in 1m. 9s. by a pigeon, when flying 200 miles in an actual race; in 1m. 15½s. by a pigeon when flying 400 miles in an actual race.

Railway Train—32s., in May, 1893, the Empire State Express, of the New York Central and Hudson River Road, drawn by engine "999," with Engineer Hogan, near Crittenden, N. Y., or a rate of 112½ miles in an hour.

Tandem Bicycle on Straightway Road—1m. 17⅕s., on December 16, 1895, on a straightaway road built for the purpose at Cheyenne, Wyo., with a wind blowing 30 miles an hour, by two riders, John Green and Charles S. Erswell.

Bicycle Straightaway—1m. 25s., John Green, Cheyenne.

Duck—40s. or 90 miles an hour.

Electric Railway—50s., on the Baltimore and Ohio Railway, at the Baltimore Tunnel in September, 1895.

Ice Boat—1m., at Newburg bay, Hudson river.

Horse Running—1m. 35⅘s., by Salvator, at Monmouth Park, August 28, 1890.

Bicycle on Track—1m. 40⅗s., by P. J. Berlo, New Orleans.

Dog—1m. 43½s., if the greyhound coursed one mile, the usual distance of 200 yards having been run in 11⅛s.

Boat—1m. 45s., torpedo boat Sokol, made by Messrs. Yarrow, of England, for Russia, and which developed in October, 1895, a speed of 34 miles an hour. Steamship Lucania in 2m 13⅘s.

Bicycle Quadruplet—1m. 47⅘s., on October 17, 1895, at Denver, Col., unpaced, flying start, Connibear, Dickson, Stone, and Swanbrough.

Bicycle Tandem on Track—1m. 52⅕s., on October 27, 1894, at Waltham, Mass., flying start, paced, Haggerty and Williams; on August 17, 1894, at Denver, Col., flying start, unpaced, Titus and Cabanne, in 1m. 55⅕s.

Horse Pacing—2m. 1½s., by Robert J., at Terre Haute, Ind., on September 14, 1894, against time.

Bicycle Triplet—2m. 1⅘s., unpaced, standing start, Kennedy, Murphy and Saunders.

Horse Trotting—2m. 3⅕s., by Alix, at Galesburg, Ill., September 13, 1894.

Horse Team Trotting—2m. 12⅕s., by Belle Hamlin and Honest George, driven by E. F. Geers, at Providence, R. I., September 23, 1892.

Man Skating—2m. 12⅗s., by J. F. Donoghue.

Horse Under Saddle—2m. 13s., by Johnson, pacing at Cleveland O., August 3, 1883, against time; in 2m. 15⅗s., by Great Eastern, trotting at Fleetwood park, September 22, 1877.

Crow—2m. 40s., or 25 miles an hour.

Horseless Carriage—4m., a carriage running 750 miles, from Paris to Bordeaux, in the international race of 1895, or 15 miles an hour throughout.

Man Running—4m. 12⅗s., professional, W. G. George; in 4m. 17⅘s., amateur, T. P. Conneff.

Man Rowing—5m. 1s., by Ellis Ward, on the Savannah river, Florida, April 1, 1872.

Man Walking—6m. 23s., professional, W. Perkins, of England; in 6m. 29⅗s., amateur, F. P. Murray, of the United States.

Man Swimming—27m. 21⅘s., J. H. Tyers, Englishman; in 28m. 55⅘s., G. Whitaker, American; both amateurs; both with seven turns.

Man in Tub—1h. 10m., by Gus Frates, in Oregon, in 1895, paddling in a tub 6 miles in 7 hours.

As will be seen by a study of the above list, in the case where figures are given of speed production wherein man is a factor, the bicycle is beaten only by the railway train, the electric railway, and the ice boat, and its nearest competitor is the running horse, and he is 18 seconds slower. Relatively, it seems as though it were impossible for the bicycle to attain a higher position in the speed world, 17½ seconds separating it from its nearest leader, the ice boat, a lead which looks almost impossible to overcome, if the idea is accepted that anything in the speed line is a cycling impossibility.—The Wheel.

### Care of Lamps.

Burners need a monthly boiling if they are to give the clear, steady light which well regulated households desire. Vinegar with a little salt sprinkled in it, is the fluid in which they should be boiled. Wicks should never be cut, but the charred portion should be rubbed off every day with a card or cloth and the loose threads clipped with small scissors. Wicks should not be used until they are very short, but should be changed frequently. An old wick becomes tightened and the webbing is no longer loose enough to draw the oil easily. Chimneys should not be washed but should be cleaned every day with a cloth wet in alcohol. This will keep them shining and brilliant. Shades should be deep enough to keep the light from striking through the clear glass to the eye, no matter how low one is sitting. The tank should be filled every day almost to the brim, but not quite.

### Some Wasted Sun Force.

The London *Electrical Engineer* gives some interesting figures in regard to wasted energy. The heat energy of the sun is the source from which we mostly draw our utilizable mechanical energies. Part of this heat energy is expended in vaporizing and lifting water, and it is calculated that in a year 31,000 cubic miles of water are so vaporized, of which 13,000 cubic miles run back by rivers into the ocean. This water falls through a height equal to the mean level of the land, which may be taken for the whole world at at about 1,000 ft. The total water volume shed over England and Wales is about 20 cubic miles per annum, and we may assume the mean level of land at about 400 ft. Thus in England and Wales 20 cubic miles of water fall 400 ft. each year. A cubic foot of water weighs 62½ lbs., therefore a cubic mile of water will weigh 9,199,872,000,000 lbs., and falling 400 feet gives us 3,679,948,800,000,000 foot pounds available from each cubic mile of water so falling. Then if 20 cubic miles so fall we have no less than 73,598,976,000,000,000 foot-pounds available, or about 2,230,272,000,000 H. P. per annum. Of course only a small fraction of this can be utilized, but for the sake of having the figures before us we have ventured to give what may be called the annual quantity of water on tap. It will be seen that a vast store of energy is now going to waste which will certainly be to some extent utilized when coal gets scarcer and therefore dearer.

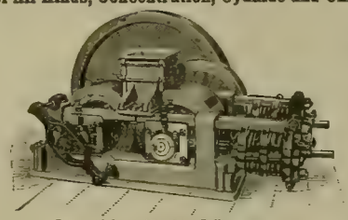
THE HARRINGTON & KING PERFORATING CO. CHICAGO.

METALS PERFORATED AS REQUIRED FOR

MINING SCREENS OF ALL KINDS

AND FOR USE IN

Milling and Mining Machinery
Reduction and Concentrating Works
Woolen, Cotton, Paper and Pulp Mills
Rice, Flour and Cottonseed Oil Mills
Sugar and Malt Houses
Distilleries, Filter Presses
Stone, Coal and Ore Screens
Stamp Battery Screens
Brick and Tile Works, Filters
Spark Arresters, Gas and Water Works
Oil, Gas and Vapor Stoves
Coffee Machinery, etc., etc.



Standard Sizes Perforated Tin and Brass Always in Stock.

Main Office and Works: 222 to 240 North Union Street, Chicago, Ill., U.S.A.
Eastern Office: No. 284 Pearl Street, New York

ESTABLISHED 1860. COLORADO IRON WORKS INCORPORATED 1876.
MANUFACTURERS AND BUILDERS OF
Smelting Plants of All Kinds, Concentration, Cyanide and Chlorination Plants.

Stamp Mills, Cornish Rolls, Roasting Furnaces, Hydraulic Sizers, Etc.

WESTERN AGENTS FOR ERIE CITY IRON WORKS ENGINES AND BOILERS.

Improved form of Crushing Rolls.

Crushers, Sampling Mills, Screens and Elevators, Sample Grinders, Etc.

WESTERN AGENTS FOR SMITH-VAILE STEAM PUMPS For all kinds of service.

Our stock of supplies for Mines, Mills and Smelters is complete and we are prepared to fill orders on shortest possible notice.
We have an ore testing plant in connection with our works and we test ore in car lots for concentration and amalgamation, and build mills to successfully treat all classes of ores by latest known methods.
OFFICE AND WORKS, 33D AND WYNKOOP STS., DENVER, COLO.

## The Works of Joshua Rose.

**Modern Steam Engines.** An Elementary Treatise upon the Steam Engine, written in plain language for use in the workshop as well as in the drawing office, giving full explanations of the construction of Modern Steam Engines, including diagrams showing their actual operation; together with complete but simple explanations of the operations of various kinds of valves, valve motions, link motions, etc., thereby enabling the ordinary engineer to clearly understand the principles involved in their construction and use, and to plot out their movements upon the drawing board. Illustrated by 453 engravings. A New, Revised and Enlarged Edition. 357 pages, 4to. ..... $6.00

**Key to Engines and Engine Running.** A Practical Treatise upon the Management of Steam Engines and Boilers, for the Use of those who desire to pass an Examination to take charge of an Engine or Boiler, etc. 164 Illustrations. 12mo, 410 pages. ..... $3.00

**The Slide Valve Practically Explained.** Embracing Simple and Complete Practical Demonstrations of the Operation of each element in a Slide Valve Movement. Illustrated by 35 engravings. 12mo. 100 pages. ..... $1.00

**Steam Boilers.** A Practical Treatise on Boiler Construction and Examination. For the use of Practical Boiler Makers, Boiler Users and Inspectors, and embracing in plain figures all the calculations necessary in Designing and Classifying Steam Boilers. Illustrated by 73 engravings. 8vo. 230 pages. ..... $2.50

**Mechanical Drawing Self-Taught.** Comprising Instructions in the Selection and Preparation of Drawing Instruments. Elementary Instruction in Practical Mechanical Drawing; together with examples in Simple Geometry and Elementary Mechanism, including Screw Threads, Gear Wheels, Mechanical Motions, Engines, and Boilers. Illustrated by 330 engravings. Fourth edition, thoroughly revised and corrected. 8vo. 303 pages. ..... $4.00

**The Complete Practical Machinist.** Embracing Lathe Work, Vise Work, Drills and Drilling, Taps and Dies, Hardening and Tempering, the Making and the Use of Tools, Tool Grinding, Marking out Work, Machine Tools, etc. Illustrated by 338 engravings. Nineteenth edition. 12mo. 504 pages. ..... $2.50

**The Pattern-Maker's Assistant.** Embracing Lathe Work, Branch Work, Core Work, Sweep Work, and Practical Gear Construction; the Preparation and Use of Tools; together with a large collection of Useful and Valuable Tables. 250 engravings. Seventh Edition. 12mo. 324 pages. ..... $2.50

# Mining Summary.

## CALIFORNIA.

### Amador.

Seventy stamps are now crushing at the Wildman-Mahoney mine.

THE ONEIDA.—A three compartment shaft is being sunk about 800 feet east of the old shaft. The engine and machinery of the steam hoist are on the ground. Ross Browne is manager.

PETROLEUM FOR FUEL.—*Record:* An experiment is to be tried at the Gover mine in substituting crude petroleum for wood in the generation of steam. Wood is getting scarce and high-priced. As the point of supply is pushed further back in the mountains its value will continue to enhance. It is estimated that by the time it is placed in the furnace the wood costs from $10 to $12 per cord. C. E. Purrington, the superintendent of the Gover, believes that better results can be obtained with petroleum. He has had two new boilers made for the purpose of making the experiment.

### Calaveras.

HEXTER MINING COMPANY.—Of the Hexter Gold Mining Company, recently incorporated, Superintendent Robinson says: "The Hexter mine is one mile from Mokelumne Hill and consists of a quartz claim about one mile in length, by 600 feet in width, under United States patent. It is one of the mother lode veins of Calaveras county, with a trend conforming to all of the mother lode veins in the mother lode zone. The formations of the country rocks are green stone and slates. The Hexter lode lies midway between Gwin mine lode on the west of the mother lode belt, and the Esperanza mine on the east wall of the zone, and is therefore known as the Central Lode or vein of the mother lode series of veins. It is often the case in some of the mother lode veins that they have a dip to the west, as in the case with the Hexter lode, for 100 feet or so in depth, when they right up and pitch east. This is caused by local disturbances and rarely effect the vein to any great depth.

THE UTICA MILL.—At the Utica mine, the biggest single gold producer in the United States, the ore is quartz, schistose and slaty diabase, and chloritic and talcose schist, with iron sulphurets. It is crushed in jaw-breakers at the head of the shaft, after passing over grizzlies, and is dropped into bins, from which the ore is conveyed in cars to three other bins in the mill, one for each section of 20 stamps, having a capacity of 600 tons each. The bins discharge into Challenge self-feeders. The 60 stamps weigh 775 pounds each, and drop 105 times per minute, the drop being 6 inches and the discharge 19 inches from the new die. Only one chock-block is used, causing the height of discharge to constantly increase. The duty of the stamps is four tons in twenty-four hours. Round-punched tin screens 10x14 inches, are used. They are lightly burned before using. Three and a half of the screen sheets are tacked on the screen frame on three sides; the top side is secured by a long, narrow strip of wood screwed to the frame. The superficial area of the discharge is about 287 sq. in. The screen frame is braced by six cross ribs, to which the screens are tacked. A splash board is suspended in front of the screen by eye-bolts and hooks, with a strip of canvas tacked along the bottom, the full width of the screen. An iron apron or table is secured to the front of the mortar below the screen, the bottom of which falls 1 inch below the lip of the mortar, permitting the insertion of a rough inch board, 9 inches in width, in front of the mortar, flush with the upper edge of the lip of the mortar; on this the pulp falls from the screen, and it is claimed to be superior to a plate in retaining the amalgam. Three inches below the board, runs a trough, in which are two apertures one-third the distance from each end, which allows the pulp to fall on a short, 6-inch wide copper plate with a pitch toward the mortar, and from thence to the apron plate 2 inches wide and 24 feet long, set to a grade of 3 inches to the foot. An inside front plate is used in the mortar. From the apron plate the pulp passes to a sluice box and is conducted to the spreaders of the vanners, of which there are twenty-four. After leaving these the pulp is led through a sluice box and flume one mile long to the canvas plant. The plates are dressed every morning; a battery is hung up, the water shut off, the splash board removed and washed off, as also the screen and the entire front of the battery, to remove all sand; the plate is then vigorously scoured with a whisk-broom to loosen the amalgam. A very dilute solution of cyanide of potassium is sometimes used during this operation, and the loosened amalgam brushed to the foot of the plate. The plate is then scraped upward with a piece of rubber 4x4 inches and ¼ inch thick; a piece of rubber belting would answer the same purpose. The collected amalgam at the head of the plate is removed in a scoop and placed in a safe. The plate is then sprinkled lightly with quicksilver, which is spread evenly over the entire plate, the water turned on and the stamps dropped. The operation for all the plates requires nearly three hours.

A cleanup of the mill is made monthly or semi-monthly, according to the condition of the battery amalgam, at which time all necessary repairs are made, and new shoes or dies are fixed if required. Shortly before hanging up, the feed is shut off to permit the ore to be crushed down as low as possible. The water is then shut off from the battery, splash board and screen removed, and all hosed off; the inside plate is removed and the amalgam scraped off. The contents of the battery are now removed and placed in the revolving cleanup barrel, the dies replaced, tappets set, screens replaced and the mill started. The pulp that leaves the mill carries considerable auriferous pyritical slimes, as might be inferred from the high discharge used in the battery. This is conveyed through a sluice, 12x8 inches, to a canvas plant one mile distant. Just before entering the building set apart for the recovery of these slimes, the sluice is widened to eighteen inches, and divided into three sections by two narrow strips fastened to the bottom. These divisions fork off into separate sluices, which are again subdivided. Three of these subdivisions are carried directly through the building and there divided, and the other three are divided off in five separate sluices, one for each section of the canvas table. There are forty-five sections for each table—ninety in all. They are forty-two feet long, twenty-two inches wide, and set on a grade one and one-eighth inch to the foot. No. 8 duck canvas is used, and when worn on one side it is turned; it lasts about one year. The last division of the pulp, outside the building, is into five boxes, four inches square, each of which terminates in a receiving box, reaching across three canvas sections, about five and one-half feet. The five divisions supply one-third of the sluices on one side of the building, the pulp passing to the canvas through an auger hole in the side of the box. The flow is regulated by a slide suspended over the whole. Above the pulp distributing box is a clear-water box, and at the lower end of the canvas tables are two sluices side by side—one to receive the concentrates, the other for the reception and discharge of pulp. The current must be thinned and distributed so that no accumulations form.

THE ESPERANZA MINE.—The Esperanza mine at Mokelumne Hill is running a 20-stamp mill steadily, and six men breaking quartz keep the mill busy day and night. The six-ton chlorination plant will be in running order by March 20th. Stoping in the mine is chiefly from the 100-foot level below the tunnel level to keep the mill running. Grading has begun for the new hoisting works and ground will soon be broke for the additional ten-stamp mill.

### Del Norte.

*Record:* The work of preparation for mining the Jones & Fisher placer claim, on Coon creek, was completed last week. A storm is now awaited to commence mining, the water supply at present being limited to surface water caught during storms. The owners will, during the coming summer, dig a ditch four miles long to intersect Coon creek, which will furnish the necessary water to operate the claim almost continuously. The mine at present is equipped with the piping formerly used at the R. W. Miller claim on Smith river.

### El Dorado.

The Steward mine near Volcanoville, on the Georgetown divide, is being fitted out with a ten-stamp mill. They have a twelve-foot ledge of high-grade ore.

The Zantgraf, twenty-four miles southwest of here, made its first cleanup after a three weeks' run, which yielded $16,000. This is the property of E. W. & T. Chapman.

Gillmwater, Roberts & Melton have bonded two claims from W. F. Lupold, twenty-four miles east of here. There are two arrastras in operation at present, which will soon be supplanted with a twenty-stamp mill.

Pearson Brothers have bonded their electric power plant in course of construction three miles from here, on the south fork of the American river, to San Francisco capitalists. The object of the plant is to furnish power to mines within a radius of thirty-five miles. Construction work is being rapidly continued.

Superintendent Richards is supplying the Church mine with an electric light plant, and a large reservoir and pipe line.

Capt. Geo. H. Breymann, a capitalist of Toledo, Ohio, a stockholder in the Big Sandy mine, reached town to-day. This is the Captain's first visit to this coast. As reported in these columns a week ago, the owners of the Big Sandy, which was closed down at water depth two years ago, concluded to rehabilitate the property. Work is well advanced to pump the shaft and sink to a depth at present of 500 feet. Mr. Breymann is a member of Breymann Bros., contractors and submarine engineers, and of Thatcher & Breymann, owners of four of the largest dredges in the United States, and he is also owner of a line of steamers on Lake Erie. He says capital will not be spared, to delve deep as money will go so long as ore can be found, nor will capital be lacking to place as many stamps as can be furnished with material to grind.

The Big Sandy with its ten-stamp mill proved a lucrative property in its day, even to shallow depth, and may become a dividend-payer. The property is four miles north of Placerville, in the Kelsey district.

Placerville, Feb. 18, '96.

### Inyo.

D. C. Lane intends putting in a 12-H. P. gasoline engine at the Sorba mine to be used in operating a hoist. A 15-H. P. plant is to be put in at Snow's Canyon to run the new mill.

REOPENING THE PANAMINT MINES.—J. W. Keeney of Riverside has relocated several claims at Panamint and has nine men doing development work. These mines were famous as the base of supplies of Senator John P. Jones twenty years ago, when silver was in demand. From September, 1875, to May, 1876, a period of eight months, the yield was $344,333.82, or an average of $38,259.20 per month. Although the price of silver has declined, there is still profit to be made in working the old mines. The company has thirteen claims in all, some silver and some gold. The mills of the old company, under the Jones regime, are still there and have been leased by the new company, and within two weeks Mr. Keeney says he expects to have them under full blast and will add to the force of men from time to time.

### Mariposa.

*Gazette:* At the Pinon Blanco Capt. A. H. Ward is about to erect a twenty-stamp mill. He has purchased forty acres of land from J. H. Hallinan. The Pinon Blanco mines have now passed out of the prospecting stage and will shortly take rank among the producers.

HITE'S COVE.—The late lamentable accident at this mine had a very depressing effect on the men employed. Mr. Minear could not get some of them to go to work again in the mine. Their places have been filled by a fresh crew from Coulterville.

MERCED GOLD MINING COMPANY.—Work is progressing steadily on all the company's properties. The new mill at the Potosi is nearly completed and before the end of this month the stamps will be pounding out some return for the heavy initial outlay that the company has been under. The pay roll of the Merced Gold Mining Company runs from $30,000 to $40,000 a month.

THE TENDRON MINE.—This mine is usually known as the Whitlock, but the Sierra Buttes Co., Limited, the owner, has called it the Tendron as a compliment to Mr. Tendron, the chairman of the Board of Directors. About eighty men are employed at present. Development work is going on rapidly. The twenty-stamp mill is running, and so far as things have gone hitherto the mill has paid for the full cost of development of the mine.

At the Santa Rosa mine prospecting and development work is going ahead, and the owners are now just as well satisfied that their negotiations with Messrs. Hayward, Lane & Co. did not result in the mine passing out of their own control. The mill is now running, and about a dozen men are at work.

LUDWIG'S MILL.—The five-stamp battery is working steadily day and night. At the present time some remarkably rich ore is being run through. There is plenty of rock ready for crushing from several sections of the Grant.

PERSIA MINE.—W. H. Wright has started up his new ten-stamp mill on Saxon creek. In the future the Persia will probably take rank as one of the best gold producers of Mariposa. At the present time about sixteen men are on the pay roll.

THE CROWN LEAD.—Little is going on at the present time on this valuable property. It is understood that negotiations are pending with English capitalists. W. B. McSherry, the manager of the property, has been in San Francisco for some time past but is expected back daily. In the Merced river, just below the old Crown Lead dam, Robert McSherry and Mr. Pullen have been getting some good results sluicing, before the water got too heavy for them.

### Nevada.

The Superior Court has made an order ordering Messrs. Scadden, Thomas & Roberts to surrender possession of the Scadden Flat mine to the North Star Co. The order was immediately obeyed. The North Star employes resumed the work of timbering the old shaft, and will erect a pumping plant on the mine.

### Plumas.

Weather lovely, air like spring, trees budding; scarcely any snow here and not over six feet on top of Spanish peak, at 7000 feet altitude; miners muddying the water slightly; the Plumas Imperial Company is piping; the Quincy M. & W. Company has not yet got to work—some of its dams went down to Yuba City during the freshet and have not since been heard from, but will furnish some good planks for an anti-debris platform. E.

Quincy, Feb. 16th.

### Riverside.

The Briggs mine, in the Menifee district, will reopen next week with a large force of men.

The Indian Queen and Golden Chariot mines, near Perris, have received new hoists and pumps.

The Morning Star mine will soon have active development work.

### San Diego.

(Special Correspondence).—Mr. Q. R. Smith, the owner of the Jolly Boy and Oxide mining claims in Crescent Valley district has begun work.

The Geneva Gold Mining and Milling Co. begins development work on its property in Escondido this week.

Several owners of prospects are now at work in this section trying to ascertain the value of their properties. B.

Escondido, Cal., Feb. 18, 1896.

PICACHO MINES.—*Sentinel:* Work is being crowded days, nights and Sundays on the six new shafts now being put down on Senator Dorsey's mines. The seventh shaft was begun Monday and the eighth on Tuesday. The first six are now down from 45 to 70 feet each. The miners are able to sink from two to three feet in twenty-four hours.

Judge O'Connor has decided to sink three shafts, each 100 feet deep, on the mines he purchased from Richards, Josselyn and Adams.

The Santa Rosa has laid off a number of miners and hung up ten of its stamps the past week. The reason for this is attributable to a scarcity of water in the mine. Some method will shortly be adopted by which a supply of water will be obtained sufficient to keep the twenty stamps running steadily.

### Shasta.

The feed pipe, which collapsed at the Gladstone mine some time since and caused a temporary closing down of the mill, has been repaired and twenty stamps are now running steadily on good ore.

### Sierra.

*Messenger:* The Bald Mountain Extension mine directors met last Monday. H. H. Purdy was elected president and H. T. Briggs secretary of the company. The cleanup at the mine last week amounted to 103 ounces.

THISTLE SHAFT.—The Feather Fork Gold Mining Company has over 100 men employed at its mine situated in Sierra county near the boundary line of Plumas. Five hundred loads of gravel are taken out each day and it is reported that a heavy gold output is being made.

SQUIER SHAFT.—Owners of the Squier Shaft property are preparing to resume work.

At the North America mine men are taking out gravel.

### Siskiyou.

G. B. Temple refitted the Wingate Hill mine, near Clear creek, which was worked extensively a number of years ago and has yielded from $100 to $400 per day, and was stopped in the belief that it was worked out, but from present indications there is considerable good ground left. They are working at present on a high channel about 900 feet above the level of the river.

At the Bunker Hill mine, recently purchased by A. J. Hughes and Hilbert Brothers, they are rebuilding four and one-half miles of the flume and ditch, and expect to commence running the mine about the 1st of May.

The Siskiyou mine, near Clear creek, has commenced washing pay dirt. The main water right, taken from Clear creek, is conveyed through four and one-half miles of four-foot flume and several miles of ditch. There is also a ditch about three and three-fourths miles long from Crawford creek leading to the main ditch. The two creeks furnish about 1400 inches of water. From the ditch the water is conducted through a twenty-two-inch pipe until it reaches the mine, at which point is a distributor through which it is turned into two fifteen-inch pipes leading to the giants, a No. 2 and No. 3, where it is discharged through four and one-half-inch nozzles under a 350-foot pressure.

GENERAL MINING NOTES.—*Journal:* The biggest strike in quartz mining which has been made in Siskiyou, and without a doubt the largest in northern California, has just been made at French creek, seven miles from Etna. The ledge is twelve feet in width, and all the rock which has been taken out runs $350 to the ton. The ledge has been tapped at a number of places from 100 to 600 feet apart, and the rock in every instance has gone about $350. On last Saturday we were shown several pieces of quartz taken from the mine, and streaks of gold could be plainly seen running through them, the quartz being of a light and free character. This mine is owned by Engler & Atkinson, capitalists of Oakland, and was bonded to a man named Swift for $14,000 before this rich strike was made. The mine is worked under the superintendency of T. B. Dillon and employs twelve men at present. There is a small Huntington mill on the property, but a proposition is now under consideration to erect a 100-stamp mill, which will be one of the largest on the coast. The mine was formerly owned by J. O. Welsh and up to last December was worked by A. B. Chamberlain, whose tunnel when he stopped work was within 18 inches of the rich ore which has just been found. This property will go ahead of the rich ledges of Cripple Creek, and will be an immense thing for Siskiyou.

The general manager of the American Bar Mining Co. informs us that they have leased to Thomas Glinn and others the lower portion of their bar. Glinn & Co. put in their own plant and pay all expenses of mining, and also pay the American Bar Mining Co. a certain percentage of the gross yield. The American Bar Co. is not interested in any way in the expense, cost or operations of Messrs. Glinn & Co. other than to obtain their percentage of the yield. The upper portion of the property will be worked this season under the management of the American Bar Mining Co., who have let a contract to Mr. B. F. McCrary to build the necessary dip and overshot wheels, derricks, etc., and rig the claim ready for mining by April 1st, at which time the company will commence mining under their own management, with about thirty men employed. We understand that Messrs. Glinn & Co. will employ about 100 men after they have the portion leased by them opened up so that they can get room to place the men, as they expect to move over 50,000 yards of ground this season.

The favorable weather of the present month has enabled Supt. Booth of the Seattle Placer Mining Co. to complete the ditch to the west branch of Thompson creek, a distance of four miles. Members of the company from Portland and Seattle, the Messrs. Smith, have visited the property, and decided to flume the rest of the distance to the main creek, on account of the steepness of the mountain side and the tendency of the soil to slide. They are figuring with parties to put up a sawmill for cutting the required amount of lumber. The ditch and flume together will, when completed, be six miles long. In this distance it takes the waters of three creeks, two of them branches of Thompson creek.

### Trinity.

This week Tom Morton sold the talc mine discovered by him last summer in his claim at Trinity Center to Major Lyons of Redding, says the Trinity *Journal*. The purchase price was $4000. The talc carries a large amount of gold and the mine is a good piece of property.

### Tuolumne.

MINING NOTES.—*Independent:* The Bonanza mine started up last week with six men. The pumps are at work clearing the mine of water.

The Louisiana mine was experted and an offer to purchase the property for $25,000 was made by a mining company this week. The offer will undoubtedly be refused, as the mine is valued far above that sum.

## NEVADA.

ON THE COMSTOCK.—Leading Comstock mines still hold out well. The Con. Cal. & Virginia extracted during the past week 132 tons of ore that averaged over $50 a ton, which is better than twice as much $25 ore. At the old Ophir works they are now beginning to get some pay. They have a considerable body of ore that averages $12 a ton. This is

of such a character that by a little careful assorting the average can be brought up to $30 a ton. The vein of gold quartz struck in the Occidental, west of the main ledge, still holds out well. In the face of the drift it now averages $30 a ton, but in places is much richer. At the Utah, Supt Lyman is opening up an old surface tunnel that was run to the west many years ago. It was aimed to strike an immense dike of peculiar rock which lies on the north side of Cedar Hill, but for some reason work in it was discontinued before the dike was reached. In view of what has occurred at the Occidental, a good gold discovery may be made near the dike.

KENNEDY DISTRICT. The Austin *Reveille* says there are about seventy five persons at Kennedy and twelve men are working on the Irish mine for J. A. Blossom. The Sweitzer Company is still paying rent on the Kennedy mill and looking for a mine in the district on which to erect their electric plant for the reduction of ores. The company offered Mart Wiggin $5000 for his mine, which offer he refused.

ESMERALDA COUNTY.

A new mining camp has sprung up 20 miles from Palmetto. Ten locations have been made in the past few days. The average rock gives $30 in gold. It is free milling.

ELKO COUNTY.

MARDIS MINES. T. M. Charles is at Deeth arranging to resume operations. He has paid the debts against the mining properties in Mardis, has purchased machinery for working the base ores there, and as soon as it arrives at Deeth it will be hauled to Mardis and placed in working order.

LYON COUNTY.

A GOOD SEASON. *Times:* With the Rock Point mill running on Como ore this summer, the Douglass mill and railroad in operation on tailings, and the La Grande Oro and Pro Bono Publico mining companies running a steam shovel or two, and the Dredge Co. operating its plant on the Carson river, Dayton would experience quite a little boom this season. And there is pretty good reason to believe that something will be done with all of the above enterprises in a few months from now.

Five men are now working in the Boston and Lester mine in Silver City. The mine is still producing rich rock. The last working of ten tons produced $2700.

STOREY COUNTY.

Virginia *Enterprise*, Feb 19: Mr. Franklin Leonard of the Comstock Tunnel Company was in Virginia yesterday. Mr. Hogg has settled his shortage with the Comstock Tunnel Company by giving his note, which has been sent East to receive the endorsement of some of his wealthy relatives.

WHITE PINE COUNTY.

OPENING UP RICH.—*News:* The work on the Chainman mine is being pushed rapidly. Every day adds new proof that the ore body, in which the company is now sinking, is of vast extent and much richer than any that has heretofore been developed, also much freer and altogether a higher and better character of ore. The lowest assays that have so far been made are $35, and running from this amount up to $446 in gold. A winze is now being sunk to connect the sixty with the 130-foot level, which is the tunnel level and through which the ore will be extracted.

## OREGON.

BAKER COUNTY.

THE COLUMBIAN.—From Baker City is reported a strike of water in the Columbian at a depth of 215 feet, of much importance, as it is reported flowing in sufficient volume to justify the erection of a twenty-stamp mill with which to handle the ore.

AN EIGHTY-STAMP MILL.—The North Pole Mining Co., with basis of operations at Bourne, Baker county, intends to erect an eighty-stamp mill plant. B. L. McLain, who recently finished a twenty-stamp mill for the Bonanza Mining Co., recently received instructions from the London office of the North Pole Mining Co. to prepare plans and specifications for an eighty-stamp mill, which have been forwarded to Alexander Baring, London, England. The proposed new plant is in addition to a twenty-stamp mill now in operation by the North Pole Co. The new plant will be built at the mine, while the present plant will remain where it is on Cracker creek.

JOSEPHINE COUNTY.

An item in the issue of the 8th inst., credited to the Kerby *Union*, should have been credited to the Wedderburn *Gazette*.

The returns for the carload of ore shipped to the Selby Smelting Works from the Ashland mine a short time since amounted to $3142.88.

## WASHINGTON.

THE COLVILLE RESERVATION.—Over three hundred mining men and prospectors left Spokane this week for Colville Indian reservation in anticipation of the President signing the bill extending the mineral laws to the north half of the reserve. Several hundred men are in camp at Marcus, but others have gone in regardless of the warnings of the Indian police. During the past summer several hundred claims were staked out on the reservation, it being a legal point as to whether the mining laws were not already in force. Most of those now going in have been there before, and their purpose now is to stand guard over their claims. Miners and prospectors are also coming down from the camps of British Columbia. The reservation is now covered with snow, but the weather is mild, and as fuel is plentiful no hardships are anticipated.

## BRITISH COLUMBIA.

THE SMELTING BONUS. — The marvelous liberality of the Dominion Government in giving a bonus for the amount of ore smelted in the country does not work quite fairly, says the Nelson *Miner*. Comparatively rich ore that goes straight to the furnace earns its 50 cents a ton. But poorer ore has first to be concentrated. The Blue Bell ore, for instance, is concentrated in the ratio of 5 to 1 before it goes to the roasters even. The 50 cents is concentrated, too. It is only paid on ore smelted, not on ore mined, so the Kootenay Mining and Smelting Company only gets 10 cents a ton bonus on the ore. Is not this something like one law for the rich ore and another for the poor?

There was shipped over the Kaslo & Slocan railway last week 552 tons of ore, of which 252 tons went to Great Falls, and 174 tons to Everett. Forty tons of iron ore was shipped from the Iron Hand to the Nelson smelter.

W. P. Harvey has submitted a proposition to the City Council of Vancouver to build a smelter. The Council is considering the proposition.

A bond has been arranged with parties in England giving them six months in which to prospect the Swan Lake claim near Vernon, B. C., and then to have the option of taking it up at $350,000.

TRAIL CREEK.—A. P. Curry has commenced suit against the Le Roi Mining Co. for the recovery of $50,000. In his complaint he states that he subscribed for and was the owner of over 10,000 shares of Le Roi stock, at that time valued at 25 cents per share. It was understood that he was to pay for it from time to time, when assessments were made. He did pay $100 and subsequently tendered the balance—$150—which the company refused to accept and also refused to issue to him the certificates of stock. The stock, he says, is now worth $5 per share.

## ALASKA.

During January the Alaska-Mexican Co.'s mill of sixty stamps crushed 7498 tons and treated 156 tons of sulphurets, netting $24,651, of which $8700 was from the latter. The ore averaged $3.29 per ton. Expenses for the month, $13,279.

## UTAH.

CAMP FLOYD DISTRICT.

The Camp Floyd mining district of Utah, forty miles from Salt Lake City, has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71 by the development of the Sparrow Hawk and Last Chance mines, which produced $1,000,000 in the white metal. At that time there were 1000 people in Lewiston and the district was very lively; but the rich pockets having worked out, Lewiston's fame began to wane. The next big strike in the district was in the Carrie Steele, from which some parties scraped out $83,000 in about three months' time. This caused great excitement—so much so that in '72 and '73 the hill was swarming with prospectors. Then the camp again declined until '79 and '80, when it was abandoned. In 1890 attention was called to the MacArthur-Forrest cyanide process, and a test of the ore was made, with such results that the old Sparrow Hawk or Marion mine was brought out of a $40,000 or $50,000 indebtedness and put on a dividend-paying basis. The formation at Mercur is similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single-blanket vein theory.

SOME DIVIDEND PAYMENTS.—*Tribune*, Feb. 17: The Centennial-Eureka will lead off today with the distribution of $30,000 among the holders of its 30,000 shares, which will increase the total dividends to date to $1,560,000, and with ore enough in sight to repeat the day's performance for an indefinite period. Following it closely will be the Bullion-Beck, which will distribute $25,000 among the holders of its 100,000 shares of stock, which will advance the total dividends to $2,000,000, and with the ore coming out steadily. Then there is the Silver King dividend in the sum of $37,500, while the Mercur will come forward with its regular dividend of $25,000 on Thursday next, making a total to its credit of $400,000. The Ontario has paid its dividend for the month, which was the first since October, 1892, and it is not unlikely that the Daly will join the procession again at an early day, the last paid by the bonanza being in May, 1893, at which the total reached $2,850,000.

## IDAHO.

AT BURKE.—The Mammoth mine is running steadily, with about forty men employed.

The Standard tunnel is being pushed. It is now in about 1100 feet, leaving about 900 feet to bore. The rate of progress is from 20 to 40 feet a day.

The Canyon Creek Electric Co. has incorporated to furnish lights for Burke and Gem. N. Ebbley, W. Miller and H. L. Jackman, all employes of the Tiger Consolidated and Frisco mining companies, are the incorporators. The company will furnish the arc lights for the Frisco mine.

AT GEM.—The Milwaukee Co. is drifting on the Gem ledge, and expect to resume shipments of ore before long. The Helena & Frisco Mining Co. is running full time and employing 125 men. The mine and mill output is from 400 to 500 tons per day.

AT SILVER CITY.—*Avalanche:* The affairs of the Morning Star are unchanged—the miners still operating the mine—but we learn that money is en route to settle the indebtedness, when everything will assume its normal course.

AT WARDNER.—The Bunker Hill is running. Beside the steadily productive operation of the mine, four power drills are employed for development work.

The Hunter mine at Mullan is again in steady operation. At this season of the year it is not likely that it will receive further interruptions from lack of water.

SHOSHONE COUNTY.

(Special Correspondence.)—Pierce City at present has about three and one-half feet of snow and still the placer miners wish for more. H. E. Howes, manager of the American Placer Mining Co., arrived in Pierce City to-day. J. Dunn, manager of the Crescent Gold Mining Co., also came in from a visit to Kendrick. The Bond is working as usual. The Idaho mill has closed down for improvements and will start up about the 1st of March. Placer miners are getting ready to catch the water at the first thaw. Messrs. Murch & Templeman are getting supplies over to the Big Six placer group. This is a promising piece of property and it is being opened up in good shape. Locators are plentiful at present, not a day passing without one or two new locations being made and a number of them prospect very well. Messrs. Morrow & Morris are going to commence work on the Granite Lode; it is only a prospect as yet. A. Johnson & Co. have struck a ledge of ore in their crosscut tunnel on the Snowbird, that runs $206.70 to the ton; it is about fourteen inches wide. This claim adjoins the Idaho. Messrs. Miller & Sevey have a very fine showing on the Sulphide Lode; the ore is refractory; the ledge runs from twelve inches to four feet in width. Messrs. Ellis & Morris recently gave J. B. Williams of Spokane an option on the Golden Ribbon, but as he failed to take it up they have resumed work in the shaft. The Oro Fino Placer Development Co. has constructed a big reservoir on Thompson gulch and is going to boom-sluice the gulch. This is the first time booming has been tried in the camp. A company is being formed to work the Caledonia, Caledonia Annex, Caledonia Extension. This property is to be opened by a tunnel, which will be run on nearly all the way, and at 1500 feet they will have a back stope of 400 feet. The ledge is large, and low grade on the surface.

Pierce City, Feb. 5, '96.

## WYOMING.

BALD MOUNTAIN.—Frank Viox is running a mill at Bald Mountain, Wyoming, sixty miles west of Sheridan, for the Fortunate Mining Company. The mill has five steam stamps that drop at the rate of 160 strokes per minute. He had to shut down four of the stamps on account of water. The ore is free milling and will run $7 or $8 per ton and would pay a handsome profit with a good stamp mill, but the steam stamps are a failure. The mill is a one-story, round log structure and cost $11,000. The company, he says, will put a 100-stamp mill in during the year.

## SOUTH DAKOTA.

THE SOUTHERN HILLS.—The J. R. mill, three miles from Hill City, is crowded with custom ore at present from the Golden Slipper, the Dalcoath, the Hazel and a number of other mines about there. The Dalcoathe is cleaning up $25 per ton upon its ore and has a good force at work. The Golden Slipper and Hazel mines are active and other properties in their neighborhood are brightening correspondingly. The Holy Terror cleaned up last Sunday after a six days' run and a $6000 retort was the result, being deposited in the Hill City Bank Monday. The five stamps are probably capable of crushing between ten and fifteen tons of ore per day, and as the cleanup gave an average of $1000 a day during the run, the ore must have run $75 to $100 per ton. The Holy Terror shaft is undergoing overhauling and some new timbers are being put in.

## COLORADO.

The El Paso, the first mine located at Cripple Creek, is still a bonanza. A big body of ore was uncovered the other day which will assay from $1500 to $2000 per ton.

"WHERE WILL IT END?"—*Record:* At the rate mining companies are incorporating in Colorado, the question may well be asked, Where will it end? Doubtless all are glad to see such manifestations of interest in mining matters, if the proper channels could always be in that manner reached, but the mere speculation or gambling in mining stocks does not always tend to develop mines. Besides, legitimate mining cannot be overdone, while stock jobbing can—and very easily, too—as has been proven in far too many instances, and to the great detriment of good mineral sections, as well as to the mining business itself. Within the last year all Europe was flooded with mining stocks, and became correspondingly disgusted with mining ventures in consequence. For more than a hundred consecutive days Colorado has chartered and stocked at the average rate of more than twenty million dollars a day, and there is no abatement. Again the question, Where will it end?

## ARIZONA.

At the La Fortuna mines fifty men and as many horses are employed. A well has been dug in the Gila valley opposite Blaisdell station on the Southern Pacific railroad. The machinery for the mine is arriving daily at Blaisdell and is being hauled by wagon to the mine. The pipe from the well to the mines is being laid.

Mention was made some time ago of a placer-mining enterprise at Temple Bar, on the Colorado river. Two large boats of the catamaran style were built, were anchored in mid-stream, and a big water-wheel constructed between them. The force of the current turned this wheel, which was attached to a pump which forced the water out on the land to wash the rich gold-bearing gravel. The machinery cost $15,000, and probably as much more was spent on the enterprise. *Mineral Wealth* says: "The Temple Bar hydraulic plant broke from its moorings recently, and started down the river on a jamboree. It grounded a few miles down, and there it will probably stay."

V. E. Frost has sent supplies out to Groom creek to commence work on the Leland Stanford and Snipe claims. It is stated that the parties who purchased this property have put up $25,000 to be expended in development work.

AT JEROME.—The January payroll of the United Verde Copper Company at Jerome for men employed at the mines was $42,000. The company also expends thousands of dollars monthly for timbers, supplies, etc.
